**075004 HOMOGENEOUS OXIDATION OF CYCLOHEXANE BY A Ru(III) ANALOGUE OF THE MODEL PEROXIDASE SYSTEM Ru(III)-EDTA-ASCORBATE- $H_2O_2$ .** A ruthenium(III) analogue of the model peroxidase system Ru(III)-EDTA-ascorbic acid- $H_2O_2$  is an efficient catalyst for the oxidation of cyclohexane. The kinetics of the oxidation of cyclohexane to cyclohexanol by hydrogen peroxide catalyzed by the Ru(III)-EDTA-ascorbate system was investigated by spectrophotometric techniques. The kinetic parameters of the oxidation of cyclohexane to cyclohexanol were determined by potentiometric, spectrophotometric and gas chromatographic methods. On the basis of the kinetic and experimental results, a rate law for the reaction was derived and the mechanism discussed. (Edited author abstract) 22 refs.

**Ozonization** See Also PIGMENTS—Optical Properties.

**075005 OZONATION OF ORGANIC REFRACTORY COMPOUNDS IN WATER IN COMBINATION WITH UV RADIATION.** The ozonation rates of organic refractory compounds such as aliphatic carboxylic acids and alcohols were determined in water at 293 K. The experiment was carried out by recirculating a solution between an ozone absorption column and a rectangular ozone/UV reactor, and the time-dependent changes in concentration of organic substances were directly measured. In the presence of UV radiation of about  $30 W \cdot m^{-2}$ , the initial ozonation rate of organic substances was increased by  $10 \cdot 10^4$  times. The total organic carbon was effectively decreased in the presence of UV radiation. This was explained by the destruction of acetic and oxalic acid by  $HO^\cdot$  radicals which were produced in the ozone/UV

system. The ozone/UV oxidation rate of acetic and oxalic acid was roughly proportional to the degree of dissociation. (Author abstract) 19 refs.

**075006 OZONOLYSIS OF ORGANIC COMPOUNDS IN A TWO-PHASE FLUOROCARBON-WATER SYSTEM.** The ozonation process may be more efficiently carried out in a two-phase system. The second phase consists of a reusable, fluorinated hydrocarbon, with an ozone solubility of 12-14 times that of water. The fluorinated solvent serves as both an ozone source and a non-aqueous phase in which the oxidation occurs. With this novel two-phase process, it is also possible to perform selective oxidation. The experimental results are presented for organic compounds such as phenol, naphthol, etc. The extent of degradation is measured in terms of pH changes, HPLC, and TOC. (Edited author abstract) 19 refs.

**075010 KINETICS OF THE SUBTRANSITION OF MULTILAMELLAR DIPALMITOYLPHOSPHATIDYLCHOLINE.** An X-ray diffraction method was used to study the kinetics of the conversion between two phases in 1,2-dipalmitoyl-L-phosphatidylcholine (DPPC) dispersions. The time course of conversion after a rapid temperature change did not follow a simple monotonic function. The conversion occurred in three stages. In the first stage, rapid changes in the hydrocarbon chain packing and the repeat period of lamellar stacking were observed. In the second stage, remarkable changes could not be observed. In the third stage, gradual changes were observed. Except for the first stage, the process traced a sigmoid curve. This suggests the existence of a cooperative interaction in the arrangement of lipid molecules. A tentative theory of transition kinetics based on lenient cooperativity is proposed. (Edited author abstract) 13 refs.

**075011 NUCLEATION KINETICS OF POLYMORPHIC TRANSITION FROM PHASE II TO PHASE III OF HEXACHLOROETHANE: METASTABILITY/UNSTABILITY.** The conversion of the transition from phase II to III of  $C_2Cl_6$  were measured for the range between 38.81 and 41.15°C (the transition point: 43.64°C). A simple model was devised appropriate to the present mononuclear transition. Using this, the induction periods, that are inversely proportional to the nucleation rates, were extracted from the observed curves. The resulting induction periods varied from 0.07 to 1500 h. In terms of the classical nucleation theory, though its applicability for such a wide variation is questionable, it was shown that there are two temperature regions bounded at about 40.8°C in which nucleation behaviors are different. As shown in the previous papers, the growth rates of the same transition were too fast to measure below a certain threshold temperature which was lower than 41.9°C. These threshold behaviors in nucleation and growth were tentatively attributed to the changeover from metastability to instability. (Author abstract) 24 refs.

Koga, Yoshikata (Univ of British Columbia, Vancouver, BC, Can). *Physica B & C* v 146 n 3 Oct 1987 p 408-415.

**075012 STRUCTURES AND PHASE TRANSITIONS IN PIPERAZINIUM HEXACHLOROMETALLATES,  $(C_4H_{12}N_2)[MCl_6]$ ,  $M = Te, Pb, Pt$ , AND  $(C_4H_{12}N_2)[MCl_6] \cdot 3H_2O$ ,  $M = Sn$ . AN X-RAY DIFFRACTION AND  $^{35}Cl$  NQR STUDY.** Crystal structures and the nature of the chemical bond in piperazinium hexachlorometallates were studied by X-ray diffraction and  $^{35}Cl$  NQR spectroscopy. Piperazinium hexachlorostannate trihydrate shows a solid-solid phase transition at  $T_c = 256$  K. A disorder of the piperazinium ring and of one of the three water molecules appears in the high temperature phase. The disorder affects the  $^{35}Cl$  NQR spectrum. **075013 PYROELECTRIC CHARACTERISTIC OF PHASE TRANSITION OF TAM SINGLE CRYSTAL.** Using the measuring method of pyroelectric effect, the characteristic of phase transition along the C axis in TAM (Tris (hydroxymethyl) amine methane) single crystal, a new type of polar crystal material, is studied. No trace of phase transition in TAM single crystal is found when the method of electric charge integral measurement is used at

temperatures of  $20^\circ C \leq T \leq 128^\circ C$ , whereas the phase transition is found to be accompanied by a reversion of pyroelectric current at a temperature near  $135^\circ C$ , when measured in the range of  $100^\circ C \leq T$  with an equal-rate heating method. The phase transition temperature  $T_c$  established above has demonstrated the result of  $T_c = 134.3^\circ C$  presented by N. Doshi, et al. (Author abstract) In Chinese. 6 refs.

**075015 POLYMORPHISM IN THE BIS(PHENALKYLAMMONIUM)TETRACHLOROMETALLATES.** Compounds of the general formula,  $(C_6H_5C_nH_{2n-1}NH_3)_2MCl_4$ , where  $n = 1$  to 10;  $M = Cd, Cu, Zn$ , and  $Co$ ; were prepared and characterized by differential scanning calorimetry. All of the compounds prepared with  $n > 1$  were observed to undergo solid-solid phase transitions and the high entropies of the solid-solid phase transitions indicate that there is a considerable amount of disorder in the high-temperature phase. Similarity of the thermodynamic results divides the compounds into two groups: the  $Cd$  and  $Cu$  derivatives, and the  $Co$  and  $Zn$  derivatives. Trends within each group and between groups can be attributed to the influence that phenyl group packing has on the thermodynamic behavior. (Author abstract). 39 Refs.

**075017 ELECTRON PARAMAGNETIC RESONANCE MEASUREMENTS OF PHOTOCHEMICAL RADICAL PRODUCTION IN HUMIC SUBSTANCES - 1. EFFECTS OF  $O_2$  AND CHARGE ON RADICAL SCAVENGING BY NITROXIDES.** Electron paramagnetic resonance spectroscopy (EPR) was employed to measure the ability of Aldrich humic acid (HA) to photosensitize the consumption of a series of cationic, neutral, and anionic nitroxides. These stable organic radicals react rapidly with a suite of inorganic and organic radicals to form diamagnetic products. In the presence of  $250 \mu g/mL$  HA and under near-natural light conditions, easily detectable rates of nitroxide consumption are observed in both air- and Ar-equilibrated samples. However, at a given nitroxide concentration, signifi-

cantly lower rates of nitroxide loss are observed in the presence of air, consistent with the view that  $O_2$  and nitroxides compete for a substantial portion of the total radical pool. Additional study results and significance of the overall results are discussed. (Edited author abstract) 43 refs.

**075019 PHOTOLYSIS OF S-PHENYL THIOBENZZOATES AND THEIR USE AS PHOTOINITIATORS.** Photolysis of S-phenyl thiobenzoates (1) in benzene produced benzaldehyde, diphenyl disulfide, and biphenyl as major products. This indicates that 1 underwent CO-S bond fission upon photoexcitation. Among the various aryl-substituted S-phenyl thiobenzoates, 4-benzoyl and 4-acetylbenzoate derivatives were photolyzed most efficiently, probably because of involvement of the triplet excited state in the photocleavage of 1. When 1 was irradiated in phenyldiethyleneglycol acrylate, polymer was formed. The efficiency of the photopolymerization was greatly enhanced by the introduction of 4-benzoyl group on the benzoate phenyl ring. It also increased with decreasing its initial concentration. (Edited author abstract) In Japanese. 8 refs.

**075023 ELECTROLUMINESCENCE AND CHARGE CARRIER TRANSPORT IN POTASSIUM-DOPED ANTHRACENE.** The increase in the electroluminescence (EL) intensity in potassium-doped anthracene crystals (K-Ant) was investigated in relation to the mechanism of EL. Carrier drift mobilities  $\mu_{e+h}$  and transient EL were measured by the doubly-injected impulse method. The drift mobility of K-Ant along the c-axis was larger by a factor of 1.5 than in an undoped anthracene single crystal for electric fields larger than  $1.9 \times 10^4 \text{ V} \cdot \text{cm}^{-1}$ . An analysis of the transient EL showed that recombination through recombination centers in K-Ant crystals occurs more efficiently than in anthracene single crystals. These results reveal that the potassium atoms in K-Ant crystals do not act as carrier traps but, rather, act as recombination centers. (Author abstract) 26 refs.

**075024 CONTROL OF THE ELECTRONIC STRUCTURE OF ORGANIC CONDUCTORS AS EXEMPLIFIED BY [NMP][TCNQ] CHARGE-TRANSFER COMPLEXES.** Through replacement of cations with neutral molecules of similar shape and polarizability in a highly conducting 'metal-like' charge-transfer organic conductor, the deliberate control of the electronic structure from a quarter to a half-filled band is possible. This goal has been achieved with the N-methylphenazinium (NMP) salt of the tetracyanoquinodimethane (TCNQ) anion by partial replacement of the cation with phenazine. A detailed study of the optical, electrical, and magnetic properties of these conducting molecular solids has led to the evolution of a broad understanding of the physics of one-dimensional organic conductors and a reinterpretation of the mechanism of electron transport in such solids. (Edited author abstract) 41 refs.

**075027 PHYSICAL-CHEMICAL PROPERTIES OF CHLORINATED DIBENZO-p-DIOXINS.** Reported and newly determined experimental data for aqueous solubility, octanol-water partition coefficient, vapor pressure, and Henry's law constants of the polychlorinated dibenzo-p-dioxins are presented and reviewed. Correlation equations are derived for these properties as a function of chlorine number and molar volume, which enable the solubility and octanol-water partition coefficients of most congeners to be estimated with an accuracy within a factor of 2 and vapor pressure and Henry's law constant with a factor of 5. It is suggested that properties of homologous series are best correlated by a two-stage process. In the first stage, treated here, simple correlations are developed to establish approximate values as a function of molar volume and chlorine number. This should be followed by a more rigorous second stage treating isomer differences and using more refined molecular descriptors. (Edited author abstract) 53 refs.

## Polarographic Analysis

**075029 POLAROGRAPHIC EXAMINATION OF LUPININE SURFACE PROTONATION IN BORATE SOLUTIONS.** The authors examined the height ( $i_{\text{lim}}$ ) of the catalytic surface wave in borate buffer solutions of lupinine as a function of solution pH and buffering capacity, in order to determine the kinetic parameters of lupinine surface protonation under the effect of acid components of the borate buffer solutions. The overall rate constant of lupinine surface protonation (i.e., that reflecting the effect of all proton donors,  $p_s$ ) was found using the authors' equation. The partial rate constants of lupinine surface protonation are more than an order of magnitude lower than the analogous constants for pachycarpine. 13 refs.

**Polymerization** See ALSO CRYSTALS—Phase Transitions; LIPIDS—Polymerization; POLYAMIDES—Synthesis; POLYMERIZATION—Reaction Kinetics; POLYMERS—Synthesis.

**075030 POLYMERIZATION OF METHYL PROPIONATE WITH PALLADIUM CHLORIDE, TRIPHENYLPHOSPHINE, AND PALLADIUM CHLORIDE TRIPHENYLPHOSPHINE COMPLEX.** Some results of the bulk polymerization of methyl propionate in the presence of  $\text{PdCl}_2$ , triphenylphosphine, and  $[(\text{C}_6\text{H}_5)_3\text{P}]_2\text{PdCl}_2$  complex are presented. From the polyconjugated polymers obtained, fractions based on their solubility in various solvents were separated. Subsequently, these products were characterized by IR and  $^1\text{H}$  NMR spectroscopies and by thermal analysis. The data obtained indicate that polymerization assisted by  $[(\text{C}_6\text{H}_5)_3\text{P}]_2\text{PdCl}_2$  proceeds faster, giving products with a lower cyclic oligomers content. The polymers possess good thermal stability and semiconducting properties. (Author abstract) 17 refs.

**075032 CYCLIC COMPOUNDS CONTAINING TWO OR MORE OXYGEN ATOMS IN THE RING.** Monocyclic compounds containing two or more hetero oxygen atoms which undergo polymerization by ring opening are described in this paper. The saturated systems which involve 5- to 17-membered rings are listed; besides the systematic names, the abbreviations which are in common use in the literature for these compounds are also given. Monomers with considerably larger ring size are also known; most of these compounds form cyclic oligomers which are again polymerizable. The macrocyclic compounds which are formed in this way are treated along with the corresponding monomers. With the exception of trioxane, the basic structures in all cases involve cyclic formaldehyde acetals. These compounds are mostly prepared by the acid-catalyzed reaction of a diol with formaldehyde. 263 refs.

**075035 GRAFT EMULSION COPOLYMERIZATION OF ACRYLONITRILE AND POLYVINYL ALCOHOL IN PRESENCE OF A CHAIN-GROWTH REGULATOR.** The authors studied emulsion polymerization of AN (Acrylonitrile) in presence also of isopropyl alcohol, used as a molecular-weight regulator. The data show some decrease of AN conversion and of the contents of dry solids in the latex formed; this is presumably due to decrease of the concentration of  $Mn^{3+}$ , which is partially consumed in interaction with isopropyl alcohol. The data reveal significant changes in the picture of emulsion polymerization of AN when it is conducted in presence of isopropyl alcohol. The PVA content in the copolymer is considerably lower, as is its content relative to the maximum possible amount in the copolymer. It can be concluded that isopropyl alcohol, which is presumably a more powerful chain-transfer agent than PVA (Polyvinyl Alcohol) alters substantially the picture of emulsion polymerization of PAN conducted with the use of PVA as stabilizer. 4 refs.

**075036 SPECTROSCOPIC STUDIES OF BIPOLARONS FROM OLIGOMERIZED 3-METHOXYTHIOPHENE IN SOLUTION.** 3-Methoxythiophene was anodically polymerized, then cathodically reduced to provide a neutral oligomeric product (I) composed of 3-methoxythiophene units. I and its oxidation product 2 were soluble in N,N-dimethylformamide, acetonitrile and benzonitrile and the solution phase redox process was studied as a model for reactions of insoluble polythiophenes. Oxidation to form 2 was accomplished using iodine or electrochemistry. The strong acids, nitric, perchloric or trifluoroacetic also oxidized I to 2. Rereduction of 2 to I used triethylamine. Quantitative studies showed that  $I_2$  or anodic oxidation at 0.6 V gave 2 with the same extent of oxidation. Ultraviolet-visible spectroscopy showed that 2 was composed of at least two different types of species, each type showing a pair of absorption bands between 630 and 860 nm. E.s.r. showed that 2 was mainly diamagnetic, and it is proposed that soluble dications (bipolarons) are produced. (Author abstract) 15 refs.

**075037 ROLE OF WATER IN CHAIN INITIATION BY THE SYSTEM BENZOYL PEROXIDE-TERTIARY AMINOALCOHOL IN THE POLYMERIZATION OF ACRYLONITRILE IN DIMETHYLFORMAMIDE.** An investigation was conducted of the kinetics of the polymerization of acrylonitrile (AN) in a solution of dimethylformamide (DMF), initiated by the redox system benzoyl peroxide (BP) - tertiary aminoalcohol (A). In conjunction with BP we used triethanolamine (T), ethyldiethanolamine (E), diethylethanolamine (D), and phenyldiethanolamine (P). In this work we discuss the

influence of additions of water as a second cosolvent. It is shown that additions of  $H_2O$  to DMF accelerate chain initiation by increasing the initiation efficiency. (Edited author abstract) 5 refs.

**075041 OPTIMUM REACTION CONDITIONS FOR THE POLYMERIZATION OF ANILINE IN AQUEOUS SOLUTION BY AMMONIUM PERSULFATE.** The polymerization of aniline by persulfate anion in aqueous solution was studied as a function of oxidant/monomer initial mole ratio (r). For values of r less than about 1.15, the conductivity, yield, elemental composition and degree of oxidation of the resulting polyaniline product are essentially independent of r. However, higher oxidant/monomer initial mole ratios result in over-oxidation of the polyaniline, with a concomitant decrease in conductivity and yield. (Author abstract) 29 refs.

**075042 ELECTROCHEMICAL POLYMERIZATION OF AN UNSATURATED ISOCYANATE ON THE SURFACE OF CARBON FIBRES.** Electrochemical polymerization of an unsaturated isocyanate as a function of its concentration, current density and the temperature of electrolysis has been investigated using as

cathode a graphitized monofiber with a high degree of purity. In the course of electrochemical polymerization of the unsaturated isocyanate the carbon fiber is covered with polymer some of which after extraction with acetone remains on the fiber in the form of local outgrowths. From the electron micrographs of the carbon fiber samples obtained after electrolysis of unsaturated isocyanate and extraction with acetone it is postulated that grafting of the polymer on the surface of the carbon fiber is associated with the energy inhomogeneity of this surface. (Author abstract) 12 refs.

**075043 RADICAL POLYMERIZATION OF DIETHYLENE GLYCOL-BIS-ALLYL CARBONATE.** The structure of polyethylene glycol-bis-allyl carbonate has been studied and its parameters within the model of overlapping statistical coils determined. A kinetic scheme of the synthesis of the polymer is proposed. The quantitative characteristics of the rates of the elementary stages have been found by the method of solving the back kinetic problem. The results satisfactorily describe the rate of polymerization of diethylene glycol-bis-allyl carbonate. (Author abstract) 20 refs.

Nikiforenko, V.S. (Ukrainian Plastics Research Inst, USSR); Alekseyev, N.N.; Zaitsev, Yu.S. *Polym Sci USSR* v 28 n 10 1986 p 2290-2297.

**075044 GRAFT ANIONIC COPOLYMERIZATION OF OCTAMETHYL CYCLOTETRASILOXANE WITH OLIGOSTYRENE CARBOCYCLOSILOXANE.** A study was made of the formation of graft copolymers in the anionic copolymerization of octamethyl cyclotetrasiloxane with oligostyrene carboxycyclosiloxanes that have cyclotrisiloxane substituents in the organic framework surrounding the carbon-carbon backbone. Investigations based on GLC, gel chromatography and also NMR were used to determine the extent to which copolymerization conditions may influence the character of the reactions and the structure and composition of the products. If appears from the experimental data that the part played by reactions of chain transfer and interchain interaction increases with the increase in grafting density, in the length of the polysiloxane branches, and in line with depletion of the monomer. (Edited author abstract) 20 refs.

**075045 INVESTIGATION OF THE CATIONIC COPOLYMERIZATION OF GLYCOLIDE WITH OPTICALLY ACTIVE AND RACEMIC LACTIDE UNDER THE ACTION OF  $SnCl_4 \cdot 2H_2O$ .** The kinetics and mechanism of cationic copolymerization of glycolide with L- and D, L-lactide under the action of  $SnCl_4 \cdot 2H_2O$  in the melt at  $140-180^\circ C$  is studied by PMR spectroscopy and gravimetric methods. The kinetics of the consumption of comonomers for various compositions of the initial monomer mixture are studied. The reactivities of L- and D, L-lactides are shown to be almost equal. The copolymerization constants as calculated from the Feinmann-Ross equation are found to be  $r_1 = 2.70$  and  $r_2 = 0.35$  for glycolide and lactide respectively. The activation energies are identical for both monomers ( $67 \pm 3$  kJ/mole), and the order of the polymerization rate for the two monomers is also the same, i.e. 0.5. (Edited author abstract) 13 refs.

**075047 EFFECT OF WATER ON THE ANIONIC POLYMERIZATION OF  $\alpha$ -METHYL- $\alpha$ -N-PROPYL- $\beta$ -PROPIOLACTONE.** The effect of water on the anionic polymerization of  $\alpha$ -methyl- $\alpha$ -n-propyl- $\beta$ -propiolactone was studied by performing kinetic measurements in THF with different amounts of water, at 38.6°C, with tetramethylammonium benzoate as the initiator. The data were treated by assuming that the propagation occurs through free ions, ion pairs, and the corresponding water-solvated species. Analysis of the results leads to the conclusion that the hydrated ion pairs do not contribute to propagation and that the free ions which are in small amounts are less reactive than the ion pairs. Thus the role of water introduced into the medium is to remove a large fraction of the ion pairs from the propagation reaction by hydration. (Author abstract) 13 refs.

**075050 POLYMERIZATION OF METHYL METHACRYLATE USING THIOCRESOLS.** In order to examine the initiating function of thiols for radical polymerization, the polymerization of methyl methacrylate (MMA) was investigated in the presence of thiocresols (Tere). It was found that the rate of polymerization increased by the addition of formic acid (FA), although the initiating activity of Tere was weak. The kinetic study was made and the following rate equation was obtained in a certain range of Tere and FA concentrations;  $R_p = k[MMA]^{1.5}[Tere]^{0.5}[FA]^{0.5}$ . This equation suggested that initiating radical was produced as a result of the reaction among MMA, Tere, and FA. The rate of polymerization initiated by Tere-FA system was found to decrease in the following order: o-Tere > m-Tere > p-Tere-FA system. (Edited author abstract). 3 Refs. In Japanese.

**075051 POLY-1,2-azEPINES BY THE PHOTOPOLYMERIZATION OF PHENYL AZIDES. PRECURSORS FOR CONDUCTING POLYMER FILMS.** The authors report experimental evidence for the formation of poly-1,2-azepines as the primary product of the polymerization of secondary amines. The ease of oxidation of these polymers is investigated in view of the formation of conducting polymers. On the basis of the evidence presented, poly-1,2-azepines are established to be the primary products of the photopolymerization of phenyl azides. The polymers are easily oxidized to delocalized charged species, yielding conducting polymers that can be formed in films with pattern structures. 24 Refs.

## Preprocessing

**075052 STUDY OF THE MECHANISM OF HYDROGENOLYSIS OF THIOPHENE ON AN ALUMINUM-COBALT-MOLYBDENUM CATALYST AND MOLYBDENUM DISULFIDE USING  $^{35}\text{S}$ .** The hydrogenolysis of thiophene has been studied on a sulfurized aluminum-cobalt-molybdenum catalyst and molybdenum disulfide containing the  $^{35}\text{S}$  radioisotope. It has been found that in both cases formation of  $\text{H}_2\text{S}$  occurs via the participation of sulfur on the catalyst, which, in turn, is replaced by sulfur cleaved from thiophene. It has also been established that two types of sulfide sulfur are found on the aluminum-cobalt-molybdenum catalyst, and that these have different reactivities. A large portion of sulfur on the catalyst (ca. 60%) is not involved in  $\text{H}_2\text{S}$  formation. (Edited author abstract) 10 refs.

**075055 POLYKETOEETHERESTERS FROM**

**4,4'-DICHLOROACETYLDIPHENYL ETHER AND THEIR CHARACTERIZATION.** As phenacyl chloride is more reactive than benzyl chloride is more reactive than benzyl chloride, 4,4'-dichloroacetyldiphenyl ether (DADE) should prove even more reactive than a dichloride of the  $\text{Ar}(\text{CH}_2\text{Cl})_2$  type. The work presented here comprises a study of the polycondensation of DADE with sodium adipate (ADP), sebacate (SEB), or terephthalate (TER). This study has revealed that a dichloride monomer like DADE can afford polyesters on reaction with sodium diolate monomers. The infusibility and insolubility which appears at the lower stage of  $\text{M}_n$ , even when an aliphatic diol acid is employed as monomer, seem to suggest strong intermolecular interaction between the vicinal flat and planar biphenylene moieties of the repeat units of polymer chains since simple intermolecular attractive dipolar interaction cannot account for these properties. 14 refs.

Patel, H.G. (Sardar Patel Univ, Vallabh Vidyanagar, India); Patel, R.M.; Patel, S.R. *J Macromol Sci Chem* v A24 n 7 1987 p 835-840.

**075056 CATALYTIC CONVERSIONS OF METHYLTETRAHYDROPHthalic ANHYDRIDE.** Methyltetrahydrophthalic anhydride (MTHPA) and mixtures of its isomers are among the widely used intermediates for production of polyester and epoxy resins. Information on methods of production of MHPA and MPA (methylphthalic anhydride) is confined to a few patents. The possibility of obtaining them from MTHPA by hydrogenation and dehydrogenation respectively is of interest. Experimental evidence shows that alumina-palladium catalyst with a palladium content of 5.0 mass % has the highest activity and selectivity in synthesis of 4-MPA. The yield of 4-MPA under the optimal conditions found is 60-61% on the converted feed, with 100% conversion. Alumina-palladium catalyst with a palladium content of 3.0 mass % has the highest activity and selectivity in synthesis of 4-MHPA. Under the optimal conditions found the yield of 4-MHPA is 75-80% on the converted feed, with 100% conversion. 5 refs.

**075057 THERMODYNAMIC CHARACTERISTICS OF SOLVATION OF ORGANIC COMPOUNDS IN SULFONES.** In addition to saturated cyclic sulfides, middle-distillate fractions of sulfurous and high-sulfur petroleum contain considerable amounts of organosulfur compounds of the thiophene and benzothio-phenes series, oxidation of which gives the corresponding sulfones (TPSO), having a combination of useful properties. It is therefore necessary to devise methods for their isolation and effective utilization in the national economy. This was the purpose of the work. Examination of the data reported in this paper shows that compounds containing hydroxyl groups enter into stronger specific interaction with sulfones than with compounds of other classes (cf. the  $\Delta H_{sp}^{\text{in}}$  values for methyl alcohol, nitromethane, and acetonitrile). In order to determine the specific values of  $\Delta H_{sp}^{\text{sol}}$  and  $\Delta G_{sp}^{\text{sol}}$  per OH group, we studied the dependence of these thermodynamic characteristics on the number (n) of C-H bonds in aliphatic alcohols of normal structure. It can be concluded that the extraction efficiency of most of the organic compounds included in this study is approximately the same with respect to CPSO as with respect to TPSO. 7 refs.

**075059 DEVELOPMENT OF A PROCESS FOR WASHING ABSORPTION OIL WITH WATER.** The authors selected the optimum conditions for washing oil with separator water. For this purpose we used a 2000 ml column with three plates, filled it with separator water and supplied from the top recycled oil that was withdrawn from the bottom of the column. We analyzed samples of oil and separator water. We also determined the content of thiocyanates, cyanides, sulfides, sulfates, chlorides, salts of organic bases according to a previously developed method. To determine the salt composition of the absorption oil we carried out alkaline extraction. The results of the experiments conducted showed that an increase in temperature during washing of the oil above  $80^\circ\text{C}$  had no significant effect on reducing the corrosive components and the optimal ratio oil: water was 1:10. The content of corrosive components diminished by 65%. We also conducted experiments to find the most effective equipment layout for oil washing. It is proposed that washing be conducted under industrial conditions in a  $45\text{ m}^3$  vessel with a built-in distributing ring with holes on the top. 4 refs.

**075060 STUDY OF THE MECHANISM OF HYDROGENOLYSIS OF THIOPHENE ON AN ALUMINUM-COBALT-MOLYBDENUM CATALYST USING TRITIUM.** Use of  $^3\text{H}$  has shown that adsorption of hydrogen occurs irreversibly on a sulfurized ACM catalyst, and that this hydrogen reacts with sulfide sulfur found on the catalyst to form hydrogen sulfide, but that this hydrogen does not take part in isotope exchange reactions or hydrogenation of the hydrocarbon fragment of thiophene. A proposal has been made, namely, that in the decomposition of thiophene on a sulfurized ACM catalyst  $\text{H}_2\text{S}$  is formed via SH groups on the catalyst. A reaction scheme has also been suggested. (Author abstract) 10 refs.

**075064 TPSR STUDY OF 1-BUTANOL OVER A Zn-Cr-O CATALYST.** In a previous work the interaction of n-butanol with a Zn-Cr-O catalyst was studied by Temperature-Programmed Surface Reaction (TPSR) methods. In this study the investigation is extended to the functionalities involved in the interaction of the corresponding alcohol, 1-butanol, with a Zn-Cr-O catalytic system. This aspect is of particular relevance for the direct synthesis of methanol and higher alcohols from CO and  $\text{H}_2$ , since it can help to establish whether alcohols are actually terminal reaction products or can be further involved in successive reactions, including e.g. condensation, dehydration, dehydrogenation. The results of this study confirm that some of the chemical functionalities of the Zn-Cr-O catalyst previously assessed for TPSR of n-butanol are effective also in the interaction of 1-butanol with Zn-Cr-O. 6 refs.

Lietti, Luca (Chimica G. Natta del Politecnico, Milan, Italy); Tronconi, Enrico; Forzatti, Pio. *J Mol Catal* v 44 n 2 Feb 29 1988 p 201-206.

**075065 CATALYTIC DIMERIZATION OF MONOETHANOLAMINE TO N-(2-AMINOETHYL)-ETHANOLAMINE.** The authors report that AEEA (Aminoethylethanolamine) is obtained in high selectivity by dimerization of ethanolamine in the presence of a lanthanum phosphate catalyst. It is shown that conversion of ethanolamine to AEEA is directly proportional to temperature and pressure and increases as either or both are raised. The highest yields of AEEA are obtained at 300 psig with reaction temperatures between 245 and  $255^\circ\text{C}$ . Phosphate-catalyzed dimerization of ethanolamine, while a low conversion process, provides AEEA in high selectivity under relatively mild conditions of temperature and pressure. Moreover, cyclic polyamines, the major by-products of this process, are also useful industrial chemicals. 23 refs.

**075066 PALLADIUM COMPLEX-CATALYZED CARBOALKOXYLATION OF BIS(CHLOROMETHYL)ARENES.** Palladium complex-catalyzed carboalkoxylation of bis(chloromethyl)-arenes was studied for use in the synthesis of bis(alkoxycarbonylmethyl)-arenes. Reaction parameters, such as auxiliary base, palladium complex catalyst and solvent in the reaction of 1,4-bis(chloromethyl)benzene, were found to significantly affect the selectivity for the formation of 1,4-bis(alkoxycarbonylmethyl)benzene, which was almost quantitatively obtained under optimum conditions without side reactions, such as quaternization of amine and alcoholysis of the benzylic chloride. The procedure with optimized conditions was applied to various other bis(chloromethyl)-arenes. (Author abstract) 35 refs.

**075067 KINETIC RELATIONSHIPS IN CONVERSION OF 3-METHYL-1,3-BUTANEDIOL ON PHOSPHORIC ACID CATALYST WITH ADDED SODIUM PHOSPHATE.** By means of pulse chromatography on a phosphoric acid catalyst consisting of a mixture

of phosphoric acid and sodium phosphates supported on quartz, a study has been made of the acid-catalyzed conversions of 3-methyl-1,3-butanediol (MBD) at  $120\text{--}150^\circ\text{C}$ . It has been established that the principal products are isoprene and isopropenylethyl alcohol; at long contact times, the alcohol is also dehydrated to isoprene. It has been shown that the reaction of MBD conversion is irreversible and is first-order with respect to the reactant. Rate constants have been determined for individual stages of the process. (Author abstract) 8 refs.

**075068 CONVENIENT METHOD OF SYNTHESIZING THE METHYL ETHER OF BENZOIN.** The authors propose a convenient method of synthesizing the methyl ether of benzoic acid, which makes possible an appreciable reduction in the total volume of organic solvents, quickens the process and delivers a product with high yield and high purity. Benzoic acid was synthesized by condensing benzaldehyde in a water-alcohol medium at  $50\text{--}70^\circ\text{C}$  with an equimolar mixture of acetone cyanohydrin and an alkali being used as the catalyst at the rate of 8-12% of the benzaldehyde. The reaction takes 1 h to give a 90-92% yield of benzoic acid. It is shown that the best results were obtained when 1,4-dioxane was used as the solvent, the optimum being the use of 1 mole of dioxane to 0.1 mole of benzoic acid with a methanol:benzoic acid molar ratio of 1:30, whereupon, at  $60^\circ\text{C}$ , the compound is formed in 3.5 h with the maximum yield and purity. To purify the product a single recrystallization from hexane is sufficient, whereas one of the disadvantages of the Fischer method is the complication of isolating compound (I) by repeated crystallization from nonane. 9 refs.

**075069 PHOSPHORESCENCE QUENCHING OF BENZYL BY POLYSTYRENE IN DILUTE AND SEMIDILUTE SOLUTIONS.** In this study, we have investigated the quenching of benzyl phosphorescence by polystyrene in dilute and semidilute solutions, this time employing cyclohexane and toluene as solvents. In addition to measuring phosphorescence lifetimes as a function of polymer concentration, phosphorescence intensities were also measured. A comparison of values of  $I_0/I$  and  $\tau_0/\tau$ , clearly shows that they are not equivalent. The higher values of  $I_0/I$  indicate that significant static quenching is present in addition to dynamic quenching. 18 refs.

**075070 TRANSITION STRUCTURES OF PERICYCLIC REACTIONS. ELECTRON CORRELATION AND BASIS SET EFFECTS ON THE TRANSITION STRUCTURE AND ACTIVATION ENERGY OF THE ELECTROCYCLIZATION OF CYCLOBUTENE TO BUTADIENE.** Cyclobutene (1), s-trans-butadiene (2), and the conrotatory transition structure 3 of the electrocyclic ring opening of 1 have been located at the ab initio RHF and MP2 levels of theory and with semiempirical techniques. Geometries of all three structures are reasonably insensitive to changes in basis set or inclusion of electron correlation. At the RHF level and with MNDO and MINDO/3, activation energies and heats of reaction are overestimated, while at the AM1, MP2/6-31G\*, MP2/6-31G\*\*/RHF/3-21G, and MP4SDTQ/6-31G\*\*/MP2/6-31G\* levels they are in good agreement with the experimental values. (Author abstract) 29 refs.

**075072 OLIGOMERIZATION OF PIPERYLENE AND PIPERYLENE FRACTION IN THE PRESENCE OF COMPLEX CATALYSTS BASED ON ALUMINIUM CHLORIDE.** An investigation was made of the oligomerization of industrial piperylene fraction in the presence of homogeneous catalysts (monoethyl aluminum chloride and a Gustavson complex) with the use of different solvents. It was shown that, by changing the nature of the catalyst or the nature of the solvent (heptane, mesitylene, methylene chloride), soluble products with a molecular weight of 1600-1400 and containing di- and trisubstituted cyclohexene groups and linear chain sections containing conjugated double bonds can be obtained. The possibility of oligomerizing piperylene (with an 80 percent yield) in a reaction mass on heterogenized catalysts based on aluminum halides applied to silica gel is discussed. 14 refs.

**075073 SIDE REACTIONS IN QUINOLINE HYDRODINITROGENATION.** The mechanism for hydrodinitrogenation (HDN) of quinoline to propylbenzene, propylcyclohexene and propylcyclohexane is well established. The formation of substantial amounts of species formed from HDN intermediates is reported for a cobalt-molybdenum/alumina catalyst. As many as eighteen species were found in reaction mixtures at concentration levels greater than 1 percent, with indoline and hydrindane being the most significant. The results suggest that Bronsted acidity may be responsible for the formation of indoline and hydrindane. (Edited author abstract). 11 refs.

**075074 LUMPED KINETIC MODEL FOR PROPENE-BUTENE MIXTURES OLIGOMERIZATION ON A SUPPORTED PHOSPHORIC ACID CATALYST.** A lumped kinetic model for the oligomerization of propene-butene mixtures on a supported phosphoric acid catalyst was developed. The model was based on four lumping criteria, stemming from the chemical properties of the reacting system. An automatic procedure for self-dimensioning of the model, in terms of the number of considered lumped reactions, was derived. Finally, the model reliability was tested by comparison with experimental data, reported in the literature. (Author abstract). 12 refs.

**075075 REACTION PRODUCTS OF TRIGLYCIDYL ISOCYANURATE WITH ORTHOPHOSPHORIC AND POLYPHOSPHORIC ACIDS: THERMAL BEHAVIOUR AND PYROLYSIS STUDIES.** Triglycidyl isocyanurate reacts with orthophosphate or polyphosphoric acid, under suitable experimental conditions, to give polycondensates which are flame-retardant

additives for polypropylene. These additives have been studied by means of thermogravimetry and pyrolysis. The polycondensates undergo different rearrangements at different temperatures. A probable structure of the polycondensates and of the residue char, obtained by heating them, are described. The reaction that produces char is also responsible for the formation of CO<sub>2</sub>, the swelling gas of the polymeric material during the combustion. (Author abstract) 8 refs.

**075076 ELECTROREDUCTION OF 4-AMINO-5-CYANO-2-PROPYLPYRIMIDINE.** The possibilities of electrochemical production of 4-amino-5-hydroxymethyl-2-propylpyrimidine have been studied, which is an intermediate in the manufacture of Tiakotsid, a compound helping to increase livestock productivity. Starting material for synthesis of the hydroxy derivative was 4-amino-5-cyano-2-propylpyrimidine, for which the electrochemical behavior is not known. Data is given for the electroreduction of 4-amino-5-cyano-2-propylpyrimidine at electrodes with developed surfaces area. The most negative potential at the start of electrolysis is attained at nickel cathodes covered with copper sponge. At the palladium electrode with palladium sponge where the least negative potentials are seen, amine is found in low yields while no hydroxy derivative is formed. It is shown that by using a palladized nickel electrode which is stable in sulfuric acid solution one can obtain 4-amino-5-hydroxymethyl-2-propylpyrimidine in a chemical yield of 84% and a current yield of 56%. 1 ref.

**075077 PRODUCTION OF HIGH-PURITY INDOLE FROM COAL TAR.** Data were obtained on the liquid-vapor phase equilibria under isobaric conditions in a monoethanolamine-indole system and satisfactory agreement was shown between the experimental results and the results of calculation by the Wilson and NRTL equations. These equations may be used as a model in the design of a system for separation of indole from the extract. The process of rectification with production of technical indole was carried out under conditions of a large-scale continuous laboratory system. It was shown possible to obtain indole of high purity (not less than 99.5%) by rectification of technical indole on a batch-process column. 7 refs.

**075078 PRODUCTION OF PROPENE OXIDE IN AN ORGANIC LIQUID-PHASE IMMOBILIZED CELL REACTOR.** Some major restrictions of the production of propene oxide in an organic liquid-phase immobilized cell packed-bed reactor were quantified, and techniques were investigated to enhance the epoxide production rates. Propene-epoxidizing *Mycobacterium* cells were entrapped in calcium alginate gel and contacted with the substrates, propene and oxygen, which were dissolved in a continuous organic phase, n-hexadecane. The effects of product inhibition by the toxic epoxide - microbial consumption of propene oxide and immobilized cell deactivation - restricted severely the accumulation of the epoxide in the recirculation reactor system and could be predicted using a simple mathematical model. (Edited author abstract) 19 refs.

**075080 PRODUCTION OF MESITYLENE AND PSEUDOCUMENE FROM C<sub>9</sub> AROMATIC FRACTIONS OF DIFFERENT ORIGIN.** The authors demonstrated high activity of the proposed vanadium-containing catalyst during catalytic purification of mesitylene and pseudocumene from ethyltoluenes by dehydrogenation. The most suitable feedstock for producing pure mesitylene and pseudocumene by dehydrogenation of impurities (ethyltoluenes) with subsequent rectification isolation of the pure products is the byproduct coke solvent. In addition to producing mesitylene and pseudocumene, the proposed method of processing provides for the possibility of isolating pure vinyltoluenes by extractive rectification by known methods using n-methylpyrrolidone as extractant which permits broadening the variety of commercial products from the C<sub>9</sub> aromatic fractions. 8 refs.

**075082 METHYL ACETATE: BYPRODUCT IN THE TEREPHTHALIC ACID PRODUCTION PROCESS. MECHANISMS AND RATES OF FORMATION AND DECOMPOSITION IN OXIDATION.** Methyl acetate is one of the main byproducts in the terephthalic acid process. This investigation has been aimed to shed more light on particular aspects concerning this byproduct: the relationship between the ester production and the process variables, methyl acetate behavior in the oxidation vessel, and recycle of the ester to the oxidation. The effect of some parameter variations on the ester formation is reported. Ester formation rate and the decomposition rate constant have been also calculated for operating conditions adopted in our oxidation. The ester decomposition preferably occurs through a hydrolysis reaction. The recycle of the ester to the oxidation appears then to be a valid solution to recover selectively acetic acid from this byproduct and to reduce solvent makeup, while CH<sub>3</sub>OH decomposes to CO<sub>x</sub>. (Author abstract) 17 refs.

**075083 BEHAVIOR OF A NOVEL THERMOSTABLE β-AMYLASE ON RAW STARCH.** The first extremely thermostable β-amylase from *Clostridium thermosulfurogenes* was partially purified to 98-fold. It readily

and strongly adsorbed onto raw starch. p-Chloromercuribenzoate treated  $\beta$ -amylase lost its activity toward raw or gelatinized starch but the ability to be adsorbed onto raw starch was preserved. Adsorbed  $\beta$ -amylase was gradually released from starch in the liquid phase during hydrolysis at 75°C. The degradation of raw starch by  $\beta$ -amylase was greatly stimulated by pullulanase addition. The optimum pH for raw starch hydrolysis by  $\beta$ -amylase was pH 4.5 to 5.5, whereas that of soluble starch hydrolysis was at pH 5.5 to 6.0. (Edited author abstract) 12 refs.

**075085 ISOLATION OF PHENANTHRENE FROM CRUDE ANTHRACENE.** The purpose of this study is to select a solvent that displays high selectivity with respect to phenanthrene and inertness with respect to sulfuric acid so that phenanthrene can be purified without replacing the solvent. The solvent must meet industrial health and fire safety standards. It was found that treatment of phenanthrene and the accompanying substances in  $\text{CCl}_4$  with 96% sulfuric acid effectively removes almost all the impurities and hardly entrains the phenanthrene at all. The phenanthrene solution in  $\text{CCl}_4$  separated from the resinous lower layer, neutralized with alkali and washed with water is colorless and transparent. After distillation of the solvent the phenanthrene remains in the form of a yellowish molten mass with mp 94-95°C. According to data from chromatographic analysis the product contains 10% fluorene. UV spectroscopic analysis ( $\lambda = 375 \text{ nm}$ ) indicates the absence of anthracene in the product. 3 refs.

**075086 PURIFICATION OF ORGANIC MATERIALS FOR ELECTRICAL AND OPTICAL STUDIES.** The purification steps for a given crystalline organic solid which is to be evaluated for electrical, magnetic, or optical properties are very dependent on the origins and reactivity of the materials involved. With particular reference to conductive ion-radical solids and monomeric precursors to crystallographically ordered conjugated polymers, examples are chosen to illustrate origins of impurities, selective purification methods, and alternative synthetic procedures. Building on this background, detailed materials characterization can provide not only materials of improved quality for physical study but also furnish insights to interpretation of observed physical phenomena. (Author abstract) 37 refs.

Sandman, Daniel J. (GTE Lab Inc, Waltham, MA, USA). *J Cryst Growth* v 89 n 1 Jun 1988, Purif of Mater for Cryst Growth and Glass Process - Proc of the Second Workshop, Champion, PA, USA, Sept 28-Oct 1 1987 p 111-116.

**075087 PURITY AND PURIFICATION OF SOURCE MATERIALS FOR III-V MOCVD.** The major factors that affect the quality of MOCVD-grown

III-V electronic materials are reviewed. Of prime importance is the purity of the source compounds, for example, trimethylgallium (TMG), trimethylindium (TM), arsine and phosphine. Generally, we find that the quality of these compounds is good, commercially available sources are good, as evidenced by the relatively good electronic quality of the product compounds, GaAs and InP. Newer or less commonly used sources such as cyclopentadienylmagnesium ( $\text{Cp}_2\text{Mg}$ ) or diethylarsine may still require further purification. A simple apparatus for the laboratory-scale vacuum distillation of MOCVD source materials is presented. The utility and efficacy of this purification technique is demonstrated by its application to the purification of silicon- and oxygen-contaminated trimethylindium. (Author abstract) 24 refs.

Olson, J.M. (Solar Energy Research Inst, Golden, CO, USA); Kurtz, S.R.; Kibbler, A.E. *J Cryst Growth* v 89 n 1 Jun 1988, Purif of Mater for Cryst Growth and Glass Process - Proc of the Second Workshop, Champion, PA, USA, Sept 28-Oct 1 1987 p 131-136.

**075089 VACUUM PYROLYSIS OF  $\text{CCl}_3\text{COCl}$ : MATRIX-IR AND MASS SPECTROMETRIC STUDIES OF THE INTERMEDIATES.** Vacuum pyrolysis of trichloroacetyl chloride was studied at 970-1370 K by mass spectrometry and matrix isolation-IR spectroscopy. The pyrolysis experiments were performed in a quartz flow reactor directly connected to the ion source of a quadrupole mass spectrometer or to an optical helium cryostat. The IR spectra of the pyrolysis products, condensed at 12 K in an argon matrix, have revealed the intermediate species: radicals  $\text{CCl}_3$  and  $\text{COCl}$ , carbene  $\text{CCl}_2$  and unstable ketene  $\text{Cl}_2\text{C}=\text{C}=\text{O}$ . It has also been established that the  $\text{COCl}_2$ ,  $(\text{COCl})_2$  and  $\text{C}_2\text{Cl}_4$  detected are formed in secondary reactions. On the basis of the experimental data obtained, two possible routes for the thermal dissociation of  $\text{CCl}_3\text{COCl}$  are proposed, including molecular and radical mechanisms. (Author abstract) 11 refs.

Khabashesku, V.N. (Acad of Sciences of the USSR, Moscow, USSR); Maltsev, A.K.; Nefedov, O.M. *J Anal Appl Pyrolysis* v 13 n 1-2 Jan 1988 p 135-140.

**075090 KINETICS AND MECHANISM OF THE VAPOR PHASE PYROLYSIS OF 1,3-DIOXOLANE IN STEAM.** The kinetics and mechanism of 1,3-dioxolane pyrolysis were determined in atmospheric pressure steam between 963 K and 1093 K with reactant concentrations of  $6.28 \cdot 10^{-7}$  to  $1.36 \cdot 10^{-4} \text{ mol/l}$  using a flow reactor. The reaction was found to be first order. The temperature dependence of the rate constant is given by  $\ln k = 27.6 \pm 3.2 - (51,300 \pm 6,500)/RT$  which agrees well with previous literature data. Some mechanistic aspects of levoglucosan pyrolysis are considered in light of these dioxolane results and recently published results on the pyrolysis of glycerol. (Author abstract) 34 refs.

12 n 3-4 Nov 1987 p 223-242.

**075091 KINETICS OF THE PYROLYSIS OF CYCLOHEXANE USING THE PULSE TECHNIQUE.** The kinetics and product distributions of the thermal cracking of cyclohexane were investigated in a stainless steel annular reactor using the pulse method. Experiments were conducted at 1-atm pressure and with excessive nitrogen dilution. Data were obtained at temperatures of 700-860°C and space times of 0.40-1.14 s. A kinetic analysis of the conversion-space time data revealed that conversion was autocatalytic at 700-800°C, while at higher temperatures (820-860°C) it was governed by first-order kinetics. The activation energies for the two kinetic regimes were 192.5 and 240.0 kJ mol<sup>-1</sup>, respectively. The autocatalysis was ascribed to the participation of methylallyl radicals in a new bimolecular propagation sequence. (Edited author abstract) 25 refs.

**075092 TRANSFORMATIONS OF PIPERYLENE IN THE PRESENCE OF A HETEROGENEOUS CATALYST AND HOMOGENEOUS INITIATOR AT HIGH TEMPERATURES.** It was shown that, with pyrolysis of piperylene in the presence of an indium oxide catalyst and the introduction of HBr and hydrogen into the reaction zone, the yield of divinyl and CPD is increased by a factor of 1.5-2 compared with the thermal process. A study was made of the kinetic laws governing the pyrolysis of piperylene on a unit with a nongradient reaction vessel. It was shown that, on transition from a thermal to a catalytic process, there is an increase in the rate constant and a reduction in the activation energy of piperylene decomposition. The observed effect is greater when HBr is introduced into the zone of catalytic pyrolysis. It is assumed that HBr has a modifying effect on the surface of the heterogeneous catalyst and thereby increases the A-factor of the bimolecular reactions of chain nucleation and continuation. 14.

**075093 CHARACTERIZATION OF THE ALIPHATIC NATURE OF KEROGENS ISOLATED FROM MARINE SEDIMENTS BY VACUUM PYROLYSIS.** Vacuum pyrolysis followed by saponification and fractionation of the pyrolysis products made it possible to determine hydrocarbons, fatty acids and alcohols responsible for the aliphatic polymethylene structures in kerogen. The pyrolysis study using consecutive kerogen samples from a well stratified homogeneous surface sediment core (Tokyo Bay; ca. 150-200 years) revealed that the pyrolytic lipid compounds were practically conserved during the earliest stage of diagenesis. Pyrolysis of samples from Sagami Bay sediments showed that the yields and the compositions of the lipid compounds were sufficiently variable to provide evidence for the heterogeneity of sediments caused by turbidite intercalation or subaqueous gliding. (Author abstract) 22 refs.

**075094 INDICATIONS FROM ANALYTICAL PYROLYSIS ON THE EVOLUTION OF ORGANIC MATERIALS IN THE TEMPERATURE ENVIRONMENT.** Within the carbon cycle, organic carbon circulates mostly between the atmosphere and the biomass. Smaller amounts of organic carbon however separate out into more slowly cycled pools characterized by dark colored polymers, the humic substances, while arrested bioconversion leads to the accumulation of organic deposits as peats or aquatic sediments. This paper examines from the standpoint of their pyrolysis characteristics, examples from the main groups of organic matter taken from these pools, including peat, freshwater and marine

sediments, soils with developed humus, eluviated materials and organic matter which has undergone diagenesis in the wider geochemical cycle. It represents an initial attempt to coordinate widely ranging data which may not be strictly representative in some of these areas. (Edited author abstract) 20 refs.

**075096 ABSORPTION AND CONDUCTIVITY STUDIES ON THE TRANSIENTS GENERATED IN THE GAMMA-RADIOLYSIS OF PERFLUOROBENZENE IN RIGID MATRICES.** Absorption spectrum of the transient produced on gamma-radiolysis of  $\text{C}_6\text{F}_6$  in 3-methylpentane (3MP) matrix at 77 K has bands at 370 and 460 nm. Studies using electron and hole scavengers in 3MP matrix have shown that the species responsible for the above absorption is indeed due to electron attachment to  $\text{C}_6\text{F}_6$ . However, electron attachment to  $\text{C}_6\text{F}_6$  could be dissociative or nondissociative. Conductivity measurement of a gamma-irradiated  $\text{C}_6\text{F}_6$  in 3MP show a peak thermostimulated current of  $500 \times 10^{-12}\text{A}$  as the temperature was raised above 77 K. The thermostimulated current measured for irradiated  $\text{C}_6\text{F}_6$  in 3MP was reduced to  $50 \times 10^{-12}\text{A}$  when the absorption bands were photobleached. The decrease in the thermostimulated current correlates with the depletion of species having absorption bands at 370 and 460 nm on photobleaching, indicating that the spectrum is due to the molecular anionic species and hence electron attachment to  $\text{C}_6\text{F}_6$  is nondissociative. (Author abstract) 45 refs.

**075097 AMPLITUDE AND PHASE ANISOTROPY OF PHTHALIMIDE SOLUTIONS DURING PICOSECOND EXCITATION.** In the study of optical properties of dye solutions during high power excitation, the examination of phase anisotropy (related to a change in the refractive index) deserves special attention. We studied the induced anisotropy of solutions of technical phthalimides, 3,6-tetramethyl-diamino-N-methylphthalimide in ethanol and toluene, and also of 3-monomethylamino-6-monomethylphthalimide in ethanol. The irradiation of the solution by a high power light flux in the absorption band of the compound leads to a considerable decrease in the population of the ground state. Therefore, not only the absorption (amplification) coefficient increases, but also the refractive index of the excited solution. Because of the anisotropy of the excitation (a directed polarized light flux), the refractive index of the excited solution is characterized by a given anisotropy, which leads to the occurrence of a birefringence phenomenon. It is desirable (from the experimental point of view) to characterize the induced optical anisotropy (amplitude and phase) as being due to a change in the population of the molecules in the ground state, by a dimensionless value  $\gamma = 4\pi\Delta n/\lambda\Delta\alpha$ , representing the ratio of the phase

anisotropy to the amplitude anisotropy. 13 refs.

**075098 LYOLUMINESCENCE STUDIES OF PERSISTENCE OF GAMMA-RAY INDUCED FREE RADICALS IN THE MOLTEN STATE OF IRRADIATED SACCHARIDES.** Lyoluminescence (LL) measurements of radiation-induced free radicals, which are presumed to be trapped in the matrix of organic solids, show them to be extremely stable even during storage at high temperatures. To investigate their behavior in liquid phase,  $\gamma$ -ray irradiated saccharides were melted and kept liquid for different periods of time before resolidification. An appreciable LL yield was found to remain in the solids which are once-melted and resolidified, even over periods of minutes while held at melting temperatures. Such persistence of free radicals and the possibility of use of LL-dosimetry from these once-melted samples are discussed. (Author abstract) 13 refs.

**075099 MODIFYING EFFECTS OF CYSTEINE AND AROMATIC SULFHYDRYL AND DISULFIDE AGENTS ON THE RADIATION-INDUCED DECOMPOSITION OF THYMIDINE.** Steady-state  $\gamma$  radiolysis of oxygen-free aqueous solution of thymidine has been carried out in the presence of cysteine and five aromatic sulfhydryl and disulfide agents. The common major mode of action of these compounds is their ability to scavenge water radiolysis species including OH radicals of solvated electrons. In addition, cysteine and the two compounds with a free SH group were found to act as hydrogen donor leading to an increase in the formation of the 5R and 5S diastereoisomers of 5,6-dihydrothymidine and 5-hydroxy-5,6-dihydrothymidine. Two sulfhydryl agents including cysteine were also found to chemically repair the radiation-induced oxidic radicals through efficient hydrogen donation mechanisms. It should be noticed that hydrogen atom transfer to hydroxyl and electron thymidine adducts leads to the decomposition of the thymine moiety. (Edited author abstract) 34 refs.

**075100 THERMOLUMINESCENCE 155-1611N CRYSTALLINE PHENANTHRENE.** Charge carrier photogeneration in crystalline phenanthrene has been studied by monitoring the UV-induced thermoluminescence (UVTL) as a function of external electric field for the excitation quanta at energies lower than the band gap. The electric field effect on the UVTL is discussed in terms of Poole-Frenkel- and Onsager-type dissociation of the defect-trapped geminate electron-hole pairs produced under low-temperature excitation. Quantitative agreement with the experiment is obtained with the Onsager-type model, indicating that the average distance between hole and electron in the trapped geminate pairs amounts to 7 nm. (Author abstract). 29 refs.

**075101 KINETICS OF THE RADIOLYTIC PROCESSES IN TRI-n-BUTYL PHOSPHATE.** Tri-n-butyl phosphate is widely used in radiochemistry. The main products of its radiolysis are di-n-butyl phosphate (DBP), monobutyl phosphate (MBP),  $\text{H}_3\text{PO}_4$ , and a polymer (P). It has been shown that the yield from the decomposition of TBP is equal to the sum of the yields from the formation of these products. The kinetics of the formation of DBP from TBP, MBP from DBP,  $\text{H}_3\text{PO}_4$  from MBP in a 30% TBP-n-dodecane system has been examined by a mathematical method. In this article it is included in the schemes for the decomposition of TBP. 2 refs.

**075102 KINETICS OF REACTION OF CYCLOPENTADIENE WITH SODIUM.** The kinetics of the topochemical reaction of cyclopentadiene with metallic sodium were studied in a toluene medium. It was found that the observed rate of the first-order reaction is proportional to the surface of sodium and the cyclopentadiene concentration. The values of the energy of activation and reaction-rate constants are:  $E=31\text{ kJ/mole}$ ;  $k=7.4 \cdot 10^{-4}\text{ liter/m}^2\cdot\text{sec}$  at  $40^\circ\text{C}$ . (Author abstract) 6 refs.

**075103 SOLID STATE REACTION BETWEEN  $\alpha$ -NAPHTHOL AND p-BENZOQUINONE.** The solid state reaction between  $\alpha$ -naphthol and p-benzoquinone yields a red crystalline 1:1 adduct; in very concentrated solutions the red color can be seen, but it may be due either to Mulliken charge transfer or hydrogen bonding interactions. Kinetic studies of the solid state reaction by a capillary technique indicate that p-benzoquinone is the diffusing species, and that either surface migration or vaporphase diffusion plays an important role in the rate of complex formation. Microscopic examination of a single crystal of  $\alpha$ -naphthol in the presence of p-benzoquinone vapor suggests that the reaction occurs only at defect centers on the  $\alpha$ -naphthol surface. **075104 CALORIMETRIC STUDIES OF ORGANIC SOLID-STATE REACTIONS. THE CONVERSION OF METHYL P-DIMETHYLAMINOBENZENESULFONATE TO P-(TRIMETHYLAMMONIUM)-BENZENESULFONATE.** The thermal conversion of methyl p-dimethylaminobenzenesulfonate to p-(trimethylammonium)benzenesulfonate in the solid state has been investigated using temperature-scanning and isothermal calorimetry. An enthalpy of  $-65.2\text{ kJ/mole}$  for the reaction at  $50.2^\circ\text{C}$  and an average of  $-62.6\text{ kJ/mole}$  over the temperature range  $27-109^\circ\text{C}$  have been obtained. Unusual kinetics were observed. Evidence for a physical process partially coincident with the chemical transformation in the bulk materials and for slow chemical reaction on the surface was also observed. (Author abstract) 11 refs.

**075105 SIDE REACTIONS IN THE PHENOL-/ACETONE PROCESS. A KINETIC STUDY.** The reaction of dimethylphenylcarbinol in the presence of phenol, acetone, and sulfuric acid to give  $\alpha$ -methylstyrene and byproducts as well as the reverse reactions was considered. The treatment of the experimental data was performed within a suitable mathematical model by using an optimization procedure. The kinetic parameters governing the different steps of the process and their dependence on temperature and phenol, water, and acid concentrations were determined. Useful indications for the attainment of the best working conditions were obtained. (Author abstract) 6 refs.

Beltrame, Pier Luigi (Univ di Milano, Milan, Italy); Carniti, Paolo; Gamba, Aldo; Cappellazzo, Oscar; Lorenzoni, Lorenzo; Messina, Giuseppe. *Ind Eng Chem Res* v 27 n 1 Jan 1988 p 4-7.

**075106 KINETIC PRINCIPLES AND MECHANISM OF THE REACTION OF POLYCONJUGATED SYSTEMS WITH ARYLDIAZONIUM SALTS.** The rates of the reactions of oligohydroquinone and oligophenol with aryldiazonium ion derivatives at pH 7-8 are known to decrease with the identity of the para substituent. A linear correlation has been established between the logarithmic reaction rate and  $E_{1/2}$ , the one-electron reduction potential of the diazo compound, as well as between the logarithm of the effective rate constant for the reaction and Hammett  $\sigma^+$  constants for the para-substituents in the diazonium ion. It is concluded that para-substituents influence the quantitative characteristics of these reactions and that in this reaction series one-electron transfer takes place between the donor (oligomeric anion or ion-radical) and the diazonium ion. (Edited author abstract) 12 refs.

Aleksanyan, R.Z. ('Polimerkley' Scientific-Industrial Union, Kirovakan, USSR); Avanesova, N.R.; Liogon'kii, B.I. *Kinet Catal* v 28 n 4 pt 2 Jul-Aug 1987 p 868-872.

**075107 ELECTROCHEMICAL EXPERIMENTS ON THE KINETICS OF THE COUPLING REACTION OF QUINONEDIIMINES.** The rotating ring-disk electrode (RRDE) and the spectroelectrochemical method (SEC) were employed for the kinetic study of the coupling reaction of quinonediimines (QDI) with a water-soluble coupler. The reaction rates were obtained by the measurement of the disappearance rate of QDI with RRDE and by the formation rate with SEC, respectively. The rate constants obtained by these two methods were in good agreement with each other. This suggests that the formation of the leuco dye is the rate determining step. (Author abstract) 7 refs.

**075108 KINETIC AND MECHANISTIC STUDIES ON THE FORMATION AND REACTIONS OF EARLY-TRANSITION-METAL-KETENE COMPLEXES.** A series of complexes of vanadocene or molybdenocene with unsymmetrical ketenes were prepared, either by reaction of the various ketenes with vanadocene itself or by reaction with the molybdenocene phosphine complex  $(C_5H_5)_2Mo(PEt_3)$ . All of the complexes exhibited the expected ketene C=O bonding mode, and all reactions were very specific in their formation of the facial isomer with metalocene fragment located on the side of the smaller ketene substituent. Kinetic studies were used to assess the sensitivity of the incoming vanadocene to steric and electronic effects, with the latter found to dominate. Kinetic studies and activation parameters for reaction of  $Cp_2Mo(PET_3)$  with  $EtPhC=C=O$  indicated a second-order associative mechanism, proposed to involve a nucleophilic attack of the metal center on the ketene central carbon in the rate-limiting step. (Edited author abstract) 57 refs.

**075109 HEXANE-CARBON DIOXIDE REACTION CATALYZED BY ALKALINE EARTH METAL OXIDES II. REACTION NETWORK.** The catalytic properties of alkaline earth metal oxides and the reaction sequences in the hexane-carbon dioxide reaction were investigated at 1173 K and atmospheric pressure. The catalytic activity for the decomposition of hexane to give deposited carbon increased with increase in the surface area of the catalyst, but the order of the activity for gasification of the deposited carbon was not parallel with either that for the decomposition of hexane or that for the hexane-carbon dioxide reaction. The catalytic activity for the hexane-carbon dioxide reaction was determined from the balance between the activity for the decomposition of hexane to produce the intermediate and that for the gasification of the deposited intermediate carbon. (Edited author abstract). 14 refs.

## Recovery

**075110 RECOVERY OF VOLATILE ORGANICS FROM SMALL INDUSTRIAL SOURCES.** The recovery of volatile organic compounds (VOCs) from contaminated air generated by small industrial operations such as coating operations and spray painting is an important alternative to other air cleaning techniques such as thermal or catalytic incineration. Three technologies - adsorption, absorption, and condensation - are discussed herein. The focus of this article is activated carbon adsorption. General design parameters and costs, along with their application to example cases, are given for VOC recovery by activated carbon adsorption and condensation. No commercial systems specifically for VOC recovery by absorption have yet been reported, though this technology is extremely important for other air pollution control needs. (Edited author abstract) 17 refs.

**Reduction** See Also CATALYSTS—Osmium; PLATINUM COMPOUNDS—Hydrogenation.

**075111 ELECTROREDUCTION OF SOME ARYLAZOMETHINE PYRAZOLONES.** DC polarography measurements with some 2,3-dimethyl-1-phenyl-4-(phenylazomethine)-3-pyrazolin-5-one and some of its derivatives show a single 4e, diffusion-controlled, irreversible wave in 30% ethanolic B.R. buffer, (pH < 8) while in strongly alkaline solutions (pH ≥ 10) a single 2e wave is observed. For m- and p-chloro derivatives, two single-electron waves are obtained. The voltammograms of these compounds of different sweep rates show two peaks in the cathodic scan in neutral or alkaline media, corresponding to two reduction steps. (Author abstract) 12 refs.

**075112 ELECTRODIMERIZATION OF QUINOLINE DERIVATIVES. 5-CHLORO- AND 5, 7-DI-CHLORO-8-HYDROXYQUINOLINE.** The electrochemical reduction of 5-chloro- (I) and 5,7-dichloro-8-hydroxyquinoline (II) in basic media has been studied using polarography, voltammetry and macroscale electrolysis. The experimental results show a clear influence of chlorine atoms present in the benzene ring, on the electrochemical parameters of quinoline derivatives. This can be seen from the data in Table I. A shift to lower pK and reduction potential values is observed when the number of chlorine atoms is increased. This result is in good agreement with the chemical behavior of quinoline derivatives and is due to the so-called electron attracting effect of the chlorine group. (Edited author abstract) 12 refs.

**075113 CARBANION AND RADICAL INTERMEDIACY IN THE ELECTROCHEMICAL REDUCTION OF BENZYL HALIDES IN ACETONITRILE.** The electrochemical reduction of benzyl iodide, benzyl bromide, and benzyl chloride was studied in acetonitrile on platinum and glassy carbon electrodes. The reductions of benzyl chloride, benzyl bromide, and benzyl iodide all occur as a single wave at  $E_p = -2.20, -1.85, \text{ and } -1.7V$  vs. SCE, respectively, on freshly polished platinum. Reduction of benzyl iodide in the presence of either diethyl malonate or carbon dioxide at  $-1.7V$  produces >40% yields of the diethyl ester of benzyl malonate and benzyl phenylacetate, respectively. (Edited author abstract) 31 refs.

**075114 INFLUENCE OF THE SOLVENT ON SELECTIVITY OF REDUCTION OF N-OXIDE 2-(2-OXY-5-METHYLPHENYL)-BENZOTRIAZOL BY HYDROGEN ON RANEY NICKEL.** An investigation has been made of the kinetics of reduction by hydrogen of N-oxide 2-(2-oxy-5-methylphenyl)-benzotriazol of Raney nickel in solvents of propanol-2, 1 M aqueous solution of sodium hydroxide and in the same solvent with pyridine addition. It has been shown that the selectivity of the process is determined by the nature of the liquid phase, which is related to the changes of the adsorption states of hydrogen and the N-oxide benzotriazol on the nickel surface under the influence of the solvent. (Author abstract) 14 refs.

Gostikin, V.P. (Ivanovsk Chemical Engineering Inst, USSR); Lefedova, O.V.; Ulitin, M.V. *Kinet Catal* v 28 n 2 pt 1 Mar-Apr 1987 p 305-310.

**075115 ELECTROREDUCTION OF NITRILES.** Existing electrochemical methods for the reduction of nitriles to the corresponding amines have a number of indisputable advantages. Reduction occurs at normal pressure and near room temperature, and pyrophoric catalysts are not present (or, when they are present as additives the medium is not flammable). However, the number of papers discussing the electroreduction of nitriles is small. It is the aim of work to generalize the results and reveal general trends in work concerning nitrile electroreduction that has not been discussed in review or has been published after the review appeared. It is concluded that aromatic nitriles can be reduced to amines in sufficiently high chemical and current yields at electrodes made of metals with low or intermediate hydrogen overpotential or of graphite which are coated with a layer of spongy catalyst (chiefly palladium). Here the reduction evidently follows the catalytic hydrogenation mechanism. Using low temperatures (10-20°C) and current densities (1-5 A/dm<sup>2</sup>) one can obtain near-quantitative yields of primary amines in hydrochloric and sulfuric acid solutions. 31 refs.

**075116 ELECTRODE REACTIONS OF FORMYL RADICALS ADSORBED ON MERCURY.** Laser-pulse electron photoemission was used to measure the rate constants for oxidation ( $W_2$ ) and reduction ( $W_3$ ) of formyl radicals  $HC(OH)_2$  which are formed upon capture of solvated electrons by formic acid and then become adsorbed on the mercury electrode. The transfer coefficients characterizing the dependence of  $W_2$  and  $W_3$  on electrode potential are 0.45 and 0.27, respectively (determined to ±0.05). The results are compared with the energy changes involved in the one-electron steps of the reduction of formic acid to formaldehyde where  $HC(OH)_2$  is an intermediate. (Edited author abstract) 16 refs.

**075117 ELECTROCHEMICAL REDUCTION OF 7,7-DICHLORONORCARANE AT COPPER, PYROLYTIC GRAPHITE, AND LEAD IN DIGLYME AND DIGLYME-ETHANOL MIXTURES.** Preparative electrolysis of DCNC 7,7-dichloronorcarane at mercury in diglyme or diglyme-ethanol mixture yields hydrocarbon. An investigation was conducted to determine whether DCNC can be reduced electrochemically in diglyme and diglyme-ethanol mixtures at cathodes made of other materials. Electrodes of copper ('specially pure' grade), pyrolytic graphite (MPG-6, of 'specially pure 6-4' grade) and lead (99.999%) were used as the cathodes. Electrolysis in a solution of 75% diglyme and 25% ethanol (by volume)

with 0.1 M (C<sub>4</sub>H<sub>9</sub>)<sub>4</sub>NBF<sub>4</sub> as the base electrolyte, at copper, pyrolytic graphite and lead only yields CNC, (7-chloronorcaradiene), which is produced by detachment of one chlorine atom (only traces of the hydrocarbon were detected). Here the current yields were only 1-2%. This result is in harmony with the data concerning the influence of added ethanol on the background currents under the conditions studied. 7 refs.

Girina, G.P. (Acad of Sciences of the USSR, Moscow, USSR); Kokorekina, V.A.; Feoktistov, L.G.; Alpatova, N.M. *Sov Electrochem* v 23 n 5 May 1987 p 656-658.

**075118 KINETICS AND MECHANISM OF REDUCTION OF 4p-DIMETHYLAMINO-BENZYLIDENE-3-METHYL-1-PHENYL-2-PYRAZOLIN-5-ONE BY BISULPHITE IONS IN AQUEOUS ETHANOLIC MEDIA.** The kinetics of the reduction has been studied in aqueous ethanolic media spectrophotometrically. The effect of hydrogen ion concentration on the reduction rate was investigated in a buffer solution at constant ionic strength of 1.0. The reaction was found to be first order in both of the reactants and inverse first order with respect to the hydrogen ion. The rate of reaction decreased with increasing ethanol as well as hydrogen ion concentrations. Pseudo-first-order rate constant,  $k_{obs}$ , was obtained by monitoring the disappearance of the dye. The activation parameters have been evaluated and a tentative reaction mechanism is discussed. (Edited author abstract) 14 refs.

Girgis, M.M. (Assiut Univ, Assiut, Egypt); Hassan, R.M.; Khalil, Z.H. *Indian J Technol* v 25 n 7 Jul 1987 p 334-338.

**075119 KINETICS OF ANTHRAQUINONE REDUCTION WITH SODIUM DITHIONITE IN ALKALINE MEDIUM.** The aim of this work is to study the heterogeneous solid-liquid reaction kinetics between AQ and sodium dithionite in an alkaline medium. The dithionite was chosen because of its high reduction power at low temperatures. Runs with different size particles of AQ and sodium dithionite/hydroxide mixtures of several strengths were carried out in a stirred batch reactor under atmospheric pressure and temperatures ranging from 303 to 323 K. The analysis of the results was made according to an isothermal SCM for spherical particles with no ash layer formation. It was shown that the influence of sodium dithionite concentration over the process rate agreed well with that predicted by the proposed model in the range studied. The average solid particle size effect is in agreement with the model only in the 22-50  $\mu$ m particle radius interval. 22 refs.

Burillo, J.C. (Univ Complutense, Madrid, Spain); Rodriguez, Francisco; Adrados, L.F.; Tijero, J.F. *AIChE J* v 34 n 5 May 1988 p 865-869.

**075120 REACTION ENTROPY FOR THE ELECTROREDUCTION OF AROMATIC AZO COMPOUNDS IN ACETONITRILE.** The reaction entropy for the one-electron reduction of azobenzene, naphthalene-1-azobenzene, 1,1'-azonaphthalene and 2,2'-azonaphthalene has been measured using a non-isothermal cell. Effects of the reactant size and the spin density at nitrogen atom of a radical anion are discussed. For spherical transition-metal redox couples it was found that reaction entropies depend on the difference in squares of charge numbers of both redox species and on the reciprocal of a reactant radius estimated on the basis of molecular models. (Edited author abstract) 13 refs.

Jaworski, Jan S. (Univ of Warsaw, Warsaw, Pol). *Electrochim Acta* v 33 n 5 May 1988 p 717-718.

**075121 PHOTOREDUCTION OF ALKYL VIOLOGENS AND POLYVIOLOGENS IN 2-PROPANOL AQUEOUS SOLUTION.** In order to study the effect of alkyl chain length and the polymer effect on the photoreduction behavior of some viologens, a series of alkyl viologen, polyviologen and bisviologen compounds have been synthesized. In the presence of excess 2-propanol, the initial photoreduction of alkyl viologens and polyviologens follow the pseudo-second-order reaction, the calcu-

lated rate constants are related to the alkyl chain length. In addition, the intramolecular association of radical cations of polyviologens has been found even in dilute solution. However the extent of association is varied with the alkyl chain length. The observed polymer effect of polyviologens in the photoreduction is significant which can be explained in terms of the nature of second order reaction. (Author abstract) 8 refs.

**075122 INFLUENCE OF SURFACTANTS ON REMOVAL OF TRIBUTYL PHOSPHATE FROM AQUEOUS SOLUTIONS BY FLOTATION.** The authors have examined the possibility of removal of molecularly dissolved TBP by flotation in the presence of surfactants. It is found that wastewaters containing TBP may differ in pH and may contain surfactants of different classes. If surfactants are already present in the wastes, their TBP content may be lowered significantly by selection of pH in accordance with the results of this investigation, followed by purification using the flotation method. In the absence of surfactants in the wastewaters, the TBP content can be lowered by addition of an appropriate surfactant (in accordance with the pH), followed by flotation treatment. 4 refs.

Brayalovskii, B.S. (Moscow Physical-Engineering Inst, USSR); Lutoshkin, S.A.; Kovalev, N.V. *J Appl Chem USSR* v 60 n 1 pt 2 Jan 1987 p 195-196.

**075123 CATALYTIC OXIDATION OF GROUNDWATER STRIPPING EMISSIONS.** Air stripping has been shown to be an efficient and cost effective method of removing volatile organic contaminants from groundwater and soil. Unfortunately, these contaminants are transferred to the air where they may continue to pose an environmental and health threat. Vapor phase carbon adsorption and thermal incineration are the two treatment methods which have been applied most often, but these technologies have some disadvantages. A new alternative is appearing in the form of catalytic oxidation. Like thermal incineration, it is an ultimate disposal method, but since it operates at much lower temperatures, the energy costs are also lower. This paper reviews the applicability of catalytic oxidation to control groundwater air stripping gaseous effluents with special attention given to system designs and case histories. The variety of contaminants and catalyst poisons encountered in stripping operations are also reviewed. (Edited author abstract) 14 refs.

**075124 REMOVAL OF REFRACTORY ORGANICS BY AERATION. VII. AIR STRIPPING OF BENZENE DERIVATIVES.** The removal of several benzene derivatives from water was carried out by bubble column aeration. The presence of NaCl enhanced removal rates, while the presence of alcohols decreased them. Mixtures of two hydrophobic solutes are removed by aeration as if each were present alone. The use of the equilibrium assumption for mass transport between phases seems to be reasonably (but not perfectly) satisfactory. Henry's law constants calculated from aeration data are in fairly good agreement with those calculated from vapor pressure and solubility data. Toluene, ethylbenzene, p-xylene, chlorobenzene, p-dichlorobenzene, styrene, benzene, and 3-pentanone were studied. As predicted, the ketone is not removed by aeration at a significant rate. Removal rates of the other compounds are reasonably rapid, with Henry's law constants in the range of roughly 0.1 to 0.3 (dimensionless). (Author abstract) 26 refs.

**075125 GAS-PHASE PHOTOINDUCED NUCLEATION OF OCTAORGANYL SILSESQUIOXANES.** We have investigated the nucleation of octaorganyl silsesquioxanes induced by UV light. In order to create the conditions for the formation of nuclei, we have applied a technique based on mutual heat exchange processes and diffusion of laminar flows of vapor at different temperatures. We have established the multiphoton character of the photonucleation process. We have isolated the region of the UV spectrum responsible for induction of nucleation. We propose ionic and radical mechanisms for photonucleation. We give an estimate of the effective size of the photoinduced condensation nuclei. (Author abstract) 25 refs.

**075126 EFFECT OF LIPOSOMIZATION ON REACTION CHARACTERISTICS OF PROSTAGLANDIN SYNTHETASE.** In this work the effect of liposomization of PG-synthetase derived from sheep seminal vesicular glands on the rate of prostaglandin E<sub>2</sub> (PGE<sub>2</sub>) biosynthesis was studied. It is found that the rates of PGE<sub>2</sub> synthesis showed no appreciable change in a pH range from 7.5 to 8.5, and proceeded to a plateau above a sodium arachidonate concentration of 0.5 mg/cm<sup>3</sup> for the cases of both free and liposomized enzyme. Therefore, in these experiments, the rates were measured at pH 8.0 and 1 mg/cm<sup>3</sup> of sodium arachidonate as the optimal conditions. 5 refs.

**075127 QUENCHING OF THE FLUORESCENCE OF ORGANIC LUMINOPHORES BY OXYGEN IN THIN POLYMER FILMS.** The anomalously high quenching of the luminescence of 9,10-bis-(phenylethynyl)-anthracene in thin films of PMMA by oxygen at pressures 0-25 atm is due to the structural inhomogeneity of the objects and the migration of the energy of electron excitation over the molecules of the luminophore. The apparatus of the theory of non-radiation energy transfer is used for the quantitative evaluation of the local mobility of oxygen in the regions of the polymer closest to the luminophore. Comparison of the local and volume-average diffusion coefficients of oxygen determined from experiments on the quenching of fluorescence may be an effective express method for structural investigations of polymer films. (Author abstract) 12 refs.

**075128 CYCLIC VOLTAMMETRIC STUDIES ON SOME MULTICENTRE BIPYRIDILUM COMPOUNDS.** Cyclic voltammograms of some multicentre bipyridilum compounds were recorded and analyzed. From the electrochemical data various disproportionation constants and interaction energies are calculated. For all the compounds studied two cathodic and two anodic waves were obtained. Cyclic voltammetric data for specific compounds 1-IV (fig. 1) and the two alkyl viologens are collected. These data refer to acetonitrile with tetrabutylammonium perchlorate as supporting electrolyte. These data can be analyzed with regard to (a) electron transfer to multiple non interacting system (b) electron transfer to interacting system (c) disproportionation constants and (d) the interaction energies between various redox centres. (Edited author abstract) 13 refs.

**075129**  $^{19}\text{F}$  N.M.R. STUDY OF GRAPHITE FLUOROSULFATES. Graphite fluorosulfates,  $\text{C}_6\text{SO}_3\text{F}$ , with  $n=7$  for stage-one materials, are ideally suited for  $^{19}\text{F}$  n.m.r. studies due to the unambiguous identity of the intercalate and its axially symmetric nature. The intensity of the signal shows a clear dependence on the orientation of the  $c$  axis with respect to the oscillating radio-frequency field  $H_1$ . The chemical shift value, however, is affected by the orientation of the  $c$  axis with respect to  $H_0$ . The powder spectrum of the stage-one material  $\text{C}_6\text{SO}_3\text{F}$  extends from 10 to 100 ppm at low temperatures, while motional narrowing at room temperature contributes to a sharp signal at the lower field end of the powder spectrum, corresponding to an axially symmetric chemical shift tensor. Angular dependence studies on  $\text{C}_7\text{SO}_3 + \text{D}_2\text{O}$  samples made from HOPG indicate that the majority of the intercalated  $\text{SO}_3\text{F}^-$  ions are oriented with their molecular  $\text{C}_3$  symmetry axis parallel to the  $c$  axis of graphite, or normal to  $H_0$ . Multi-staged samples made from HOPG demonstrate the stage dependence of the chemical shift of intercalated  $\text{SO}_3\text{F}^-$  ions. The chemical shift of the stage-one material is observed in the region of 10–12 ppm, while higher-staged materials show resonances at less shielded regions. (Author abstract) 15 refs.

**075130** INTERCALATION AND PARTIAL DEINTERCALATION OF TETRAHYDROFURAN IN  $\text{CsC}_{24}$ : A NEUTRON POWDER DIFFRACTION STUDY. Real time neutron powder diffraction has been used to study the intercalation of tetrahydrofuran (THF) in the second stage caesium graphite intercalated compound  $\text{CsC}_{24}$ . According to the Daumas-Herold's model, the reaction proceeds as follows: first, THF intercalates in the binary leading to a second stage ternary; second, the THF concentration increases up to  $\text{Cs}(\text{THF})_{1.75}\text{C}_{24}$  as simultaneously the compound becomes first stage. Deintercalation leads to the 2nd stage  $\text{Cs}(\text{THF})_{\approx 1}\text{C}_{24}$ . In both cases, the  $I_c$  parameter indicates THF molecules lying parallel to the graphene plane. Diffraction patterns show that the intercalated layer is liquid in the 1st stage  $\text{Cs}(\text{THF})_{1.75}\text{C}_{24}$  at room temperature but solid and structured in the 2nd stage  $\text{Cs}(\text{THF})_{\approx 1}\text{C}_{24}$  due to higher constraints. This agrees well with steric considerations using the molecular volume of THF. (Edited author abstract) 9 refs.

## Sampling

**075131** DESIGN AND OPERATION OF A VOLATILE ORGANIC COMPOUND CANISTER SAMPLER. This paper discusses the operation of a Volatile Organic Compound Canister Sampler (VOCCS) for collection of trace level volatile organic compounds in the ambient air. Volatile organic compound sampler design and operation was reviewed. Historically, collection of volatile organic compounds has been done by integrated sample bag collection or collection on chromatographic resins, both of which are a matter of great uncertainty. A new sampler and procedure was developed for collection of volatile organic compounds and the accuracy with which volatile organic compounds can be determined is being studied. 1 ref.

**075132** AUTOMATED EQUILIBRIA SYSTEM FOR MODELING LIQUID-VAPOR SEPARATION PROCESSES. The automated EQUILIBRIA system, designed for modeling systems for separation of non-ideal mixtures of organic and some basic inorganic substances ( $\text{H}_2$ ,  $\text{H}_2\text{O}$ ,  $\text{SO}_2$ ,  $\text{NH}_3$ ,  $\text{N}_2$ ,  $\text{CO}_2$ , etc.) in very wide ranges of changes in the temperature and pressure, including the regions close to (or above) the critical region, is examined. EQUILIBRIA is written in Fortran and runs in the dialog mode. It can be used as a functional part of programs for modeling or designing CES or as a totally independent system. The flow duct of the data macrostructure of the EQUILIBRIA system is presented. It consists of four types of interacting program units (combining more than 100 separate program units): modeling, executing, auxiliary, and mathematical. We will briefly examine the structure, organization, and purpose of each of them. The 'modeling' unit has two hierarchical levels. The first includes the program realizations of the basic separation processes: isothermal evaporation, multicomponent distillation, and absorption: IFLASH, SHTCUT, ABSMD. 12 refs.

**075133** INVESTIGATION OF TWO HOMOLOGOUS SERIES OF CARBOXYLIC ACIDS IN BLACK TRONA WATER FROM THE GREEN RIVER BASIN. Two series of carboxylic acids were identified in the dialysate from a sample of Black Trona Water from the Green River Basin of Wyoming. One of the series consists of straight-chain dicarboxylic acids ranging in carbon number from four to fourteen. This series had been observed by previous workers. The other series, much less abundant than the dicarboxylic acids, appears to be a series of homologous tricarboxylic acids that are derivatives of succinic acid. The structures of these compounds were determined by analysis of the mass spectra of their methyl esters and trideuteromethyl esters. (Edited author abstract) 16 refs.

**075134** ADMICELLAR CHROMATOGRAPHY: SEPARATION AND CONCENTRATION OF ISOMERS USING TWO-DIMENSIONAL SOLVENTS. Immobilized surfactant aggregates at a solid/liquid interface can act as two-dimensional solvents to increase the interfacial concentrations of organic compounds selectively. This phenomenon is the basis for a new separation process presented here, admicellar chromatography. The technique offers certain advantages over conventional chromatographic separations. Batch and column separations of isomers of heptanol are used to illustrate the concepts of the process. Equilibrium calculations with single component data are found to give reasonable predictions for the batch separation of the isomers. (Author abstract). 18 Refs.

## Soldering

**075135** ORGANIC SOLDER. A new type of organic-based conductive product to replace metallic solders and eliminate much of their accompanying processes is presented. Conventional metal materials are being replaced more and more with lower cost, lighter weight, more with lower cost, lighter weight, more versatile and easier-to-use polymer-based materials. Thermoplastic-based materials are used where the thermal characteristics of the final product would more closely duplicate those of metallic solder.

**075136** SOLUBILITY IN BINARY MIXTURES AT THE IMMISCIBILITY CRITICAL POINT. It is shown that solubility of organic solids in binary mixtures of partially miscible liquids is singular at the immiscibility critical point. The theoretically predicted maximum of solubility in the vicinity of the critical point is found experimentally. The effect is similar to the phenomenon observed near the gas-liquid critical point. The similarity of these two critical phenomena may have interesting technical applications and may provide guidelines for identifying promising new solvents for separation processes. **075137** INTENSIFICATION OF HETEROGENEOUS REACTIONS THROUGH HYDROTROPY: ALKALINE HYDROLYSIS OF ESTERS AND OXIMATION OF CYCLODODECANONE. Hydrotropic substances are capable of increasing the solubility of sparingly soluble organic compounds in aqueous solutions and can thus enhance the rates of two-phase reactions substantially. The increase in the solubility of sparingly soluble organic substances due to hydrotropes has been found to be an exponential function of the hydrotrope concentration over a wide range. A study of the rates of solid-liquid and liquid-liquid alkaline hydrolysis of esters and solid-liquid oximation of cyclododecanone, in the presence of different hydrotropes, was carried out. The potassium salts of different hydrotropes, such as, butyl monoglycol sulfonate, p-cumyl phenol, cumene sulfonic acid were found to be more effective than the corresponding sodium salts. In some cases intensification factors as high as 1000 were observed. (Author abstract) 23 refs.

**075138** SOLUBILIZATION OF ANTHRAQUINONE DERIVATIVES IN SOLUTIONS OF NON-IONOGENIC SURFACTANTS. A study has been made of the solubilization of anthraquinone,  $\alpha$ -aminoanthraquinone, and 1,4-diaminoanthraquinone in solutions of the nonionogenic surfactant Sintanol DS-10 at various concentrations. It is shown that the solubilization increases with increasing polarity of the molecules of the solubilize. The relative increase of the micellar volume with the inclusion of molecules of the solubilize within the micelle has been demonstrated viscometrically. (Author abstract) 5 refs.

Kovtun, L.G. (Textile Inst, Moscow, USSR); Korchagin, M.V.; Lazareva, N.V. *Colloid J USSR* v 49 n 4 Jul-Aug 1987 p 679-681.

**075139** SOLUBILIZATION OF n-HEXANOL IN MIXED MICELLES. The solubilization of n-hexanol by mixed anionic/nonionic and cationic/nonionic micelles was measured throughout a wide range of hexanol activities. The solubilization equilibrium constant for both kinds of mixed micelles is less than that predicted by assuming that the equilibrium constant varies linearly with nonionic/total surfactant mole ratio in the micelle. This effect is more pronounced for the anionic/nonionic mixture than for the cationic/nonionic mixture. The results are attributed to the decrease in micellar surface charge density upon insertion of nonionic surfactant in the micelle. This results in a decrease in ion-dipole attractive forces between the ionic surfactant hydrophilic group and the alcohol hydroxyl group. (Author abstract) 33 refs.

**075140 SOLUBILITIES OF FIFTEEN ORGANIC SUBSTANCES IN POLY(VINYL CHLORIDE), POLY(VINYL ACETATE), AND VINYL CHLORIDE-VINYL ACETATE COPOLYMER.** The solubilities of 15 organic solvents (benzene, fluorobenzene, ethylbenzene, chlorobenzene, toluene, p-xylene, vinyl acetate, styrene, acrylonitrile, carbon tetrachloride, chloroform, acetone, methyl ethyl ketone, n-nonane, and n-decane) in poly(vinyl acetate) [100 - 200°C], poly(vinyl chloride) [115 - 150°C] and vinyl chloride(90%)-vinyl acetate(10%) copolymer [115 - 150°C] were measured at atmospheric pressure by using a gas chromatographic technique. For these systems, Henry's constants are reported on a mass fraction basis. Bonner's equation was applied at infinite dilution and the binary interaction parameters of each homopolymer were determined from the experimental results. Furthermore, it was found that the interaction parameters for copolymer could be represented by the average segment fraction of each homopolymer parameter. (Edited author abstract) 8 refs. **075141 POLAROGRAPHIC CATALYTIC HYDROGEN WAVES IN LUPININE SOLUTIONS; DETERMINATION OF THE ADSORPTION CHARACTERISTICS OF LUPININE AT THE MERCURY ELECTRODE.** In an effort to find new catalysts or inductors the authors looked at lupinine, the molecules of which have a quinolizidine nucleus (the pachycarpine molecule can be regarded as consisting of two similar, fused nuclei) with a hydroxymethyl group in the 1-position. In lupinine solutions, catalytic hydrogen waves can only be observed over the pH range from 7.5 to 10 in borate buffer solutions. When small amounts of lupinine are added to more acidic borate buffer solutions or to acetate solutions the polarograms are shifted appreciably (by some 60 mV) past the base curve, i.e., discharge of the base electrolyte occurs at more negative potentials. In borate solutions of pH 7.5 to 10.0 one can see distinct catalytic hydrogen waves. It is pointed out above that in alkaline solutions one cannot observe catalytic waves, but desorption steps are distinctly noticeable under these conditions in the curves of the changing currents in lupinine solutions. 12 refs.

**Sorption** See Also CLAY—Ion Exchange; WASTEWATER—Treatment.

**075145 SORPTION OF 2,3,7,8-TETRACHLORODIBENZO-P-DIOXIN TO SOILS FROM WATER/METHANOL MIXTURES.** Sorption of  $^{14}$ C-labeled 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) to soils from water/methanol mixtures has been evaluated by batch shake testing. Uncontaminated soils from Times Beach, MO, were used in these experiments and ranged in fraction organic carbon ( $f_{oc}$ ) from 0.0066 to 0.077. Volume fraction methanol in the liquid phase ( $f_L$ ) was varied between 0.25 and 1.0. Contact times ranging from 1 to 90 days were employed. Sorption kinetics were influenced by soil type and  $f_L$ . Sorption isotherms were linear, and when sorption partition coefficients ( $K_D$ , mL/g) were converted to  $K_m$  (mol/g), these latter values were log-linearly related to  $f_L$ . Study results are discussed. (Edited author abstract) 21 refs.

**Specific Heat** See Also FERTILIZERS—Thermal Properties.

**075146 CALORIMETRIC STUDY OF PURE AND KOH-DOPED TETRAHYDROFURAN CLATHRATE HYDRATE.** The heat capacity of pure tetrahydrofuran (THF) clathrate hydrate was measured by an adiabatic calorimeter in the temperature range of 12-300 K. A glass transition having a heat capacity jump of 1.1 J K $^{-1}$  (H $_2$ O-mol) $^{-1}$  was newly observed at 85 K. Combined with previous dielectric data, this was shown to be related to proton configurational motion in the host hydrogen-bonded lattice. The experimental heat capacity of KOH-doped THF-hydrate previously reported in the was converted to the molar one of the hydrate by measuring its eutectic melting and making appropriate correction for unreacted ice and THF. Comparison of the heat capacities and entropies of the pure and KOH-doped samples gave new information on the mechanism of the transition observed in the KOH-doped sample. (Author abstract) 29 refs.

**075147 EXAMINATION OF THE MATRIX ISOLATION FOURIER TRANSFORM INFRARED**

**SPECTRA OF ORGANIC COMPOUNDS: PART II.** Matrix-isolated (MI) Fourier transform infrared spectra have been collected on a series of aliphatic ketones. The values for the carbonyl absorptions maxima are intermediate between vapor-phase (VP) and solid-state solution (SS) phases. The data reveal a stereochemical influence on the position of the ketone carbonyl absorption when the carbons that are in the alpha position with respect to the carbonyl group contain alkyl substituents vs. protons. Steric bulk causes the frequency of the absorption to decrease. The position of the ketone carbonyl absorption was also shown to decrease as the carbonyl group migrated toward the center of a long straight-chain hydrocarbon backbone. (Edited author abstract) 15 refs.

Coleman, W.M. III (R.J. Reynolds Tobacco Co, Winston-Salem, NC, USA); Gordon, Bert M. *Appl Spectrosc* v 41 n 7 Sep-Oct 1987 p 1159-1162.

**075148 EXAMINATION OF THE MATRIX ISOLATION FOURIER TRANSFORM INFRARED SPECTRA OF ORGANIC COMPOUNDS: PART III.** Matrix-isolated (MI) Fourier transform infrared spectra (FT-IR) have been collected on a series of esters and ketones. The values for the carbonyl absorption are intermediate between the values for vapor-phase (VP) and solid-state (SS) phases. The spectra reveal a splitting or broadening of the carbonyl absorption in the majority of cases for both compound types. The splitting, on the order of 5 to 10 cm $^{-1}$ , does not appear to be a function of concentration at  $\leq 20$  ng on the cryogenic disk. The splitting is also not unequivocally due to steric hindrance about the carbonyl group. (Edited author abstract) 14 refs.

Coleman, W.M. (R.J. Reynolds Tobacco Co, Winston-Salem, NC, USA); Gordon, Bert M. *Appl Spectrosc* v 41 n 7 Sep-Oct 1987 p 1163-1169.

**075149 DETERMINATION OF METHYLENE GROUPS IN OXYGEN-CONTAINING COMPOUNDS BY IR SPECTROSCOPY.** The methylene groups of saturated hydrocarbons are represented in the infrared spectrum by the absorption bands of swinging vibrations in the region 780-720 cm $^{-1}$ , the intensity of which is proportional to the content of these groups. This region is used for the quantitative determination of -CH $_2$ - in open chains of different lengths. It was considered of interest to determine the content of CH $_2$ -groups in  $\alpha$ -oxides, alcohols, and acid esters, since such data have not been found in the literature. The present work used methyl ester of stearic acid, C $_{12}$  and C $_{14}$  monoxides, and C $_{13}$  and C $_{14}$  alcohols, for which the specific extinction coefficients were obtained. 3 refs.

**075150 ELECTRON SPIN RESONANCE AND POLARISATION REVERSAL ON ELECTROTHERMALLY ANNEALED X-RAY IRRADIATED TGS.** The polarization reversal of electrothermally annealed x-ray irradiated TGS crystals is studied. After annealing the switching times are shorter and the asymmetry of the switching behavior relative to the direction of the switching field becomes more pronounced. Electron spin resonance measurements show that electrothermal annealing causes a marked amplification of the recombination of the NH $_3$ CHCOOH radical. On the basis of the experimental results the microscopic mechanism of electrothermal annealing is discussed. (Author abstract) 17 refs.

Schlemmbach, H. (Karl-Marx-Univ, Leipzig, East Ger); Volk, T.R.; Windsch, W.; Moebius, M.; Shuvalov, L.A. *J Phys D* v 20 n 10 Oct 14 1987 p 1297-1301.

**075151 SPECTROSCOPY OF ACID-BASE INTERACTION OF SUBSTITUTED TETRAAZAPORPHIN DERIVATIVES IN NONAQUEOUS MEDIA.** We used the method of electronic spectroscopy to study the influence of the functional substitution in H $_2$ TAP on its

properties as a base. Analysis of the present data and the published data shows that for such complex conjugated multicenter bases as tetraazaporphyrins, the influence of the substituent is not confined to simple quantitative changes. The possibility must be considered that the formation of each of the forms depends not only on the internal factors, i.e., the electronic structure of the molecule, but also on external factors, such as the composition and properties of the medium, playing an active role in acid-base interactions. 12 refs.

Berezin, B.D.; Khelevina, O.G.; Stuzhin, P.A. *J Appl Spectrosc* v 46 n 5 May 1987 p 510-515.

**075152 SPECTROSCOPIC INVESTIGATION OF INTERMOLECULAR INTERACTION IN THE N-METHYLPYRROLIDONE-WATER SYSTEM.** IR spectra were studied of the N-methylpyrrolidone (MP)-water and MP-CCl<sub>4</sub> two-component systems in the region of stretching vibrations of the MP C=O and water O-H. It was shown that a chemical compound of composition C<sub>5</sub>H<sub>9</sub>NO·2H<sub>2</sub>O is formed in the MP-water system. (Author abstract) 6 refs.

**075153 FT-IR MICRO-SPECTROSCOPIC STUDIES OF SEVERAL CHARGE-TRANSFER ORGANIC ELECTRICAL CONDUCTORS.** A series of infrared reflectance measurements using FT-IR Micro methods were conducted on bis(ethylenedithio)tetrathiafulvalene (ET') and bispropylenedithio)tetrathiafulvalene (PT') salts. The technique is useful for characterizing, at room temperature, differences between  $\beta$ -,  $\beta'$ - and  $\alpha'$ -type structures vs.  $\alpha$ -structures. The  $\beta$ -,  $\beta'$ -, and  $\alpha'$ -type structures show a vibrational feature at approximately 1280 cm<sup>-1</sup> which has been assigned as the -C-C-H bending vibrations and is absent in the spectrum of the  $\alpha$ -type salts. This vibration shifts toward higher frequency in going from the PT to the ET salts, and the results indicate stronger hydrogen bonding and harder lattices in the ET salts as opposed to the PT salts. (Edited author abstract) 38 refs.

Ferraro, John R. (Loyola Univ, Chicago, IL, USA); Wang, Hau H.; Ryan, John; Williams, Jack M. *Appl Spectrosc* v 41 n 8 Nov-Dec 1987 p 1377-1382.

**075154 EXAMINATIONS OF THE MATRIX ISOLATION FOURIER TRANSFORM INFRARED SPECTRA OF ORGANIC COMPOUNDS. PART V.** MI/FT-IR spectral data have been collected on selected types of organic compounds containing the carbonyl group. By the varying of the ratio of the matrix gas to the compound (M/E) as well as the matrix gas (Ar vs. Xe), the observed splitting of the carbonyl absorption band was attributed to both conformer isolation and aggregation in the matrix. The splitting of the carbonyl group of methyl acetate was attributed to aggregation, while conformer isolation was found to exist for phenyl acetate and trimethylacetaldehyde. (Edited author abstract) 28 refs.

Coleman, W.M. III (R.J. Reynolds Tobacco Co, Winston-Salem, NC, USA); Gordon, Bert M. *Appl Spectrosc* v 41 n 8 Nov-Dec 1987 p 1431-1438.

**075155 EXAMINATION OF THE MATRIX ISOLATION FOURIER TRANSFORM INFRARED SPECTRA OF ORGANIC COMPOUNDS: PART VI.** Matrix isolation Fourier transform spectral evidence is presented that documents the isolation of rotational isomers in an argon matrix. The spectral evidence is based on the presence of split carbonyl absorption bands in the spectra of selected derivatives of methyl acetate which do not vary in intensity with changes in the matrix-to-eluate ratios. The results compare very favorably with FT-IR data on the identical compounds obtained in the vapor phase. The low temperature of the matrix isolation experiment (10 K) allows for the observation of rotational isomers not seen at the high temperatures of the vapor-phase experiment (500 K). (Edited author abstract) 20 refs.

**075156 EXAMINATION OF THE MATRIX ISOLATION FOURIER TRANSFORM INFRARED SPECTRA OF ORGANIC COMPOUNDS: PART VII.** A series of lactones and lactams have been examined by matrix isolation Fourier transform infrared spectrometry. The values for the carbonyl absorption bands fall between those reported for the same compounds in the vapor phase and solid state. Multiple absorption bands are found in the region of carbonyl absorption for compounds examined under the matrix isolation phase. Ring strain has a dramatic effect on simplifying the complexity of the spectra. Little or no aggregation effects are observed for either the lactones or lactams under accepted operating parameters. The effects of substituents on these systems are comparable to those found in the vapor-phase and solid-state data. (Author abstract) 19 refs.

**075158 ELECTROCHEMICAL AND SPECTROSCOPIC STUDIES OF 1,4-BENZOQUINONE IN AMBIENT TEMPERATURE CHLOROALUMINATE IONIC LIQUIDS.** The chemical, electrochemical, and spectroscopic properties of 1, 4-benzoquinone (Q) have been studied in the aluminum chloride: 1-ethyl-3-methylimidazolium chloride (ImCl) ionic liquid. In basic melts (AlCl<sub>3</sub>:ImCl mole ratio <1.0), fast scan voltammetry (up to 1000 V s<sup>-1</sup>) shows that Q reduces to Q<sup>2-</sup> in a fast two-electron step, probably followed by solvation of the dianion. Infrared and visible spectroscopic data, and electrochemical measurements show that Q reacts with Cl<sup>-</sup> in basic melts producing the dianion of monochlorohydroquinone. Q shows no electrochemical response in acidic melts. However, it reacts with the solvent and eventually generates HCl which is electrochemically detected at a Pt electrode. (Edited author abstract) 15 refs.

**075159 ANGULAR DEPENDENCE OF DIFFUSE REFLECTANCE INFRARED SPECTRA. PART III: LINEARITY OF KUBELKA-MUNK PLOTS.** The linearity of plots of the Kubelka-Munk function against concentration is investigated for weak and strong absorption bands in the spectrum of a typical organic analyte, caffeine. The linear region is extended when measurements are made with an off-axis optical geometry, in comparison to an in-line configuration. For the latter configuration, the linearity is improved when crossed polarizers are placed before and after the sample. (Author abstract) 12 refs.

**075160 EXAMINATIONS OF THE MATRIX ISOLATION FOURIER TRANSFORM INFRARED SPECTRA OF ORGANIC COMPOUNDS: PART**

**VIII.** Matrix isolation Fourier transform infrared (MI/FT-IR) data has been presented that documents the presence of discrete conformers in an argon matrix for a series of ketones. The distribution of conformers in the matrix was related to the structure of the molecule, in that rigid structures (i.e., small rings, bicyclic systems, and unsaturated systems) displayed simple carbonyl absorption patterns relative to those of their less rigid counterparts. Also, conformer isolation was seen for halosubstituted ketones. These results are in agreement with previous findings concerning the vapor-phase (VP) spectra of these molecules. (Author abstract) 22 refs.

**075161 SPECTROSCOPIC INVESTIGATION (INS, FIR) OF STRUCTURAL PHASE TRANSFORMATIONS OF FERROELECTRIC CH<sub>3</sub>NH<sub>3</sub>HgCl<sub>3</sub>.** The mechanism of the structural phase transformation from the ferroelectric room temperature to the paraelectric high temperature phase at T=333(2)K in methylammonium trichloromercurate was investigated by inelastic neutrons scattering and FIR-measurements. Energies for an internal torsional mode of CH<sub>3</sub> and an external librational mode of NH<sub>3</sub><sup>+</sup> are derived from the inelastic part of neutron time of flight spectra. The evaluation of the quasielastic intensity revealed a jump rotation at T approximately 100 K and a rotational diffusion at T approximately 295 K for the CH<sub>3</sub>NH<sub>3</sub>-group around the C-N axis. For CH<sub>3</sub>- this rotational diffusion still exists in the paraelectric phase. It is however, strongly reduced for NH<sub>3</sub> at the phase transition where an end over end libration for the whole CH<sub>3</sub>NH<sub>3</sub>-group is activated. (Edited author abstract) 11 refs.

**075162 SURFACE-ENHANCED RAMAN SPECTROSCOPY OF THE CATECHOLAMINE NEUROTRANSMITTERS AND RELATED COMPOUNDS.** The surface-enhanced Raman spectra (SERS) of dopamine, norepinephrine, epinephrine, epinine, isoproterenol, 3-methoxytyramine, and catechol in pH 7.2 buffers on a silver electrode are reported. Catechol and the catecholamines are shown to be coordinated to silver through both oxygens. The methoxylated derivative is a monodentate complex. Intensities maximize near -0.9 V vs saturated calomel electrode. The strongest bands in the spectra are phenolic carbon-oxygen stretches and the  $\nu_{196}$  modes around 1270 and 1480 cm<sup>-1</sup> respectively. (Edited author abstract) 28 refs.

**075163 TIME RESOLVED ELECTRON PARAMAGNETIC RESONANCE SPECTROSCOPY OF ANTHRACENE IN FROZEN AQUEOUS MICELLAR SOLUTIONS: TRIPLET YIELDS AND LIFETIMES.** Anthracene in frozen aqueous micellar solutions of n-alkyltrimethylammonium halides, C<sub>n</sub>TAX(n=10, 12, 14, 16, 18; X=I, Br, Cl), was subjected to laser pulse excitation in the cavity of an EPR-spectrometer. Decaying triplet signals were recorded with a signal processing unit designed for time resolution in the ms-range. Measured triplet lifetimes  $\tau_T$  at 80 K were lowest in C<sub>10</sub>TAI-solutions, highest in C<sub>16</sub>TAI-solutions, and varied with n; relative triplet quantum yields  $\phi_T$  were lowest in C<sub>16</sub>TAI and highest in C<sub>16</sub>TAI-solutions. Relative fluorescence quantum yields  $\phi_F$  were also higher in C<sub>16</sub>TAI than in C<sub>16</sub>TABr-solutions. (Edited author abstract) 24 refs.

**075164 XPS STUDY OF ORIENTED ORGANIC MOLECULES. VESICLES OF AZOBENZENE-CONTAINING ALKYL AMMONIUM AMPHIPHILES.** We have observed the N 1s spectral change by aggregation of azobenzene-containing ammonium amphiphiles  $C_{12}AzoC_MN+Br^-$  ( $M=2, 10$ ) in water by utilizing the freezing method. By comparing the calculated intensity ratio of azo-group nitrogen to ammonium nitrogen with that experimentally observed, the N 1s spectral change has been successfully correlated with various aggregate's model structures of the amphiphiles, such as the lamella, tube, and globule. With the assumption that the N 1s photoelectron (about 850 eV in kinetic energy) mean free path is about 30 Å, the bilayer lamella model has proved to be most probable for both  $M=2$  and  $M=10$  compounds. This paper has successfully demonstrated that XPS (X-ray photoelectron spectroscopy) has the potential for use in analyzing molecular orientation in addition to conventional elemental and functional group analyses. (Edited author abstract) 19 refs.

**075165 OVERTONE VIBRATIONAL PHOTO-CHEMISTRY OF QUADRICYCLANE.** The photochemistry of quadricyclane (Q) was explored by single-photon excitation to high vibrational levels. Spectra of the  $\nu = 4-7$  carbon-hydrogen overtones were recorded by using intracavity absorption and photoacoustic detection. These spectra were compared to the infrared fundamental spectrum and assigned. Excitation of the  $\nu = 5$  and  $\nu = 6$  bands of cyclopropanoid and methylenic hydrogens leads to reaction. At least one intermediate, probably a vibrationally excited form of norbornadiene (N), must be involved because partitioning among various reaction channels is pressure dependent. Apparent rate constants were measured and correlated with variations in pressure according to the Stern-Volmer relationship. (Edited author abstract) 41 refs.

Lishan, David G. (Allied-Signal Corp, Morristown, NJ, USA); Reddy, K. V.; Hammond, George S.; Leonard, Jack E. *J Phys Chem* v 92 n 3 Feb 11 1988 p 656-660.

**075166 SURFACE-ENHANCED RAMAN SPECTRA OF PYRAZINE, PYRIMIDINE, AND PYRIDAZINE ADSORBED ON SILVER SOLS.** Raman spectra of pyrazine, pyrimidine, and pyridazine adsorbed on silver sols have been obtained and compared with existing data from corresponding experiments on Ag electrode. These two techniques give similar results except for pyrazine for which strong bands, observed only in the SER Surface Enhanced Raman spectrum on the electrode, may be due to reduction products coadsorbed on the Ag surface. Chemisorption plays a role in the absorption of diazines as evidence of Ag-N bond formation was found in the SERS Scattering of all three molecules. Both N atoms of pyridazine are bound to the substrate and this explains an enhancement, for the latter molecule, of 2 orders of magnitude larger than for the other two compounds. The presence of low-frequency Ag-N modes and predictions of surface selection rules support 'edge on', rather than flat, orientation of diazines on the colloidal particles. (Author abstract) 23 refs.

**075167 QUANTITATIVE DETERMINATION OF ORGANIC COMPOUNDS BY DIFFUSE REFLECTANCE FOURIER TRANSFORM INFRARED SPECTROMETRY.** Diffuse reflectance Fourier transform infrared spectrometry can successfully be used for the quantitative determination of small amounts of organic compounds, e.g. fractions from liquid chromatography. The relation between sample concentration and reflectance is - at first approximation - described by the Kubelka-Munk equation. For a correct application of the Kubelka-Munk equation, the absolute reflectance of the matrix material used as reference also has to be known. A

method is described that permits an accurate calculation of the absolute reflectance of the matrix material from experimental values obtained with conventional FTIR equipment. (Edited author abstract) 7 refs.

Reinecke, Dietmar (Fachhochschule Muenster, Steinfurt, West Ger); Jansen, Anton; Fister, Friedrich; Schernau, Ulrich. *Anal Chem* v 60 n 11 Jun 1 1988 p 1221-1224.

**075168 ATOMIZATION OF ORGANIC COMPOUNDS IN THE INDUCTIVELY COUPLED PLASMA.** The problem of incomplete atomization when nonmetals are being determined in aspirated organic solutions was studied. Abel inverted spatial profiles of  $C_2$ , CN, C(I) and Si(I) emission were acquired at several heights. It was found that molecular emission caused by the analyte is restricted to the lower aerosol channel. Nonmetal atomic emission is found in the toroidal region and higher up in the aerosol channel. Compounds that contained nonmetals comprised of either oxygen, nitrogen, or sulfur, which were dissolved in xylene, exhibited nonmetal emission intensities independent of the structure of the compound. (Author abstract) 17 refs.

**075169 EXAMINATIONS OF THE MATRIX ISOLATION FOURIER TRANSFORM INFRARED SPECTRA OF ORGANIC COMPOUNDS; PART IX.** A series of  $\beta$ -diketones and alkenes have been examined by matrix isolation Fourier transform infrared spectroscopy. The matrix experiment detects the presence of extensive keto-enol tautomerization in selected  $\beta$ -diketones. Certain absorption bands in the IR could be used to estimate the extent of the tautomerization. The data gathered on the alkenes found their absorption bands to occur in the same regions ( $\pm 5 \text{ cm}^{-1}$ ) as those found for VP and SS phases. Minimal nearest-neighbor (aggregation) interactions were found. These results are in contrast to those found for aldehydes, ketones, and acids of similar chain lengths. (Author abstract) 31 refs.

**075170 EXAMINATION OF THE MATRIX ISOLATION FOURIER TRANSFORM INFRARED SPECTRA OF ORGANIC COMPOUNDS; PART X.** The characteristics of the OH stretching absorptions in a series of catechols, resorcinols, hydroquinones, and diols have been documented with the use of matrix isolation Fourier transform infrared spectroscopy. Steric and electronic effects were described and found to agree with published results on the vapor-phase studies on the same compounds. The positions of the OH absorptions were shown to fall within a window set on the high energy side by the vapor-phase results and on the lower energy side by solid-state/solution results. The low full width at half-height values unique to the matrix experiment allowed for the observance of absorption bands not yet seen before in the vapor-phase or solid-state studies. These new bands confirm the presence of intramolecular interactions not previously documented. The data indicate that extensive intermolecular interactions occur at low loadings on the cryogenic disk (10 ng) for compounds containing polar substituents. (Edited author abstract) 18 refs.

**075171 OPTICAL LINEWIDTHS AND DEPHASING OF ORGANIC AMORPHOUS AND SEMI-CRYSTALLINE SOLIDS STUDIED BY HOLE BURNING.** The experiments described here have been performed on the  $0-0 \text{ S}_1 \leftarrow \text{S}_0$  transitions of a large variety of amorphous and semi-crystalline systems at temperatures between 0.3 and 20 K. It was found that, independent of the hole-burning mechanism,  $\Gamma_{\text{hom}}$  follows a  $T^{1.3}$  temperature law, and extrapolates to or in fact attains the fluorescence lifetime-limited value of the guest

for  $T \rightarrow 0$ . From a study of the holewidth dependence on laser power, burning time, sample preparation and detection method, conditions could be established for the determination of  $\Gamma_{\text{hom}}$  and the study of spectral diffusion. The results show that hole burning is a very sensitive technique to prove the amount of disorder of the environment directly surrounding the guest molecule. An interpretation of the experiments in terms of various theoretical models for dephasing in glasses is presented. (Edited author abstract) 56 refs.

**075172 QUENCHING OF EXCITED STATES OF XYLENOLS DUE TO HYDROGEN BONDING WITH TRIETHYLAMINE IN DIFFERENT SOLVENTS.** Hydrogen bonding between xyenols in the ground state and triethylamine (TEA) brings about red shift and increase of intensity of the absorption bands of the xyenol molecules. TEA quenches fluorescence of the xyenols at 300 K in varying degrees, possibly through a very short-lived CT species formed by strong hydrogen bonding interaction between excited xyenols and TEA, which leads to large charge transfer. At 77 K, restricted solvent relaxation or orientation impedes formation of such CT complex and consequently impedes the quenching process. Quenching is weak and absent in polar aprotic and alcoholic solvents, respectively. The monoexponential nature of phosphorescence decay of xyenols indicates establishment of very rapid equilibrium between hydrogen-bonded complexes in the triplet state and free molecules. (Author abstract) 26 refs.

**075173 KINETIC AND THERMODYNAMIC STUDIES ON NEW INTRAMOLECULAR MIXED EXCIMERS IN ANTHRACENE-PHENANTHRENE AND ANTHRACENE-PYRENE LINKED SYSTEMS.** An analysis of the intramolecular mixed excimer formation in (9-anthrylmethyl) (9-phenanthrylmethyl) ether (I) in methylcyclohexane (MCH) and methanol (MeOH) was carried out, based on spectral data and time-dependent fluorescence intensities at different temperatures and wavelengths. The rate constants for formation and deactivation of the mixed excimer and the values of  $\Delta H$  and  $\Delta S$  were determined under stationary and dynamic conditions for I. The study on (9-anthrylmethyl) (1-pyrenylmethyl) ether (II) was limited to Stevens-Ban analysis due to the closeness of the first-singlet excited states of the anthracene and pyrene chromophores. These new intramolecular mixed excimers display no significant solvent polarity effect and their thermodynamic data are similar to those of homoeexcimers. Consequently their stabilization seems to originate more from exciton resonance than from charge transfer states. (Author abstract) 24 refs.

Desvergne, J.P. (CNRS, Talence, Fr); Bitit, N.; Castellan, A.; Bouas-Laurent, H.; Soullignac, J.C. *J Lumin* v 37 n 3 Jun-Jul 1988 p 175-181.

**075174 HINDRANCE OF THE ROTATIONAL RELAXATION IN THE EXCITED SINGLET STATE OF BIPHENYL AND PARA-TERPHEYL IN COOLED SOLUTIONS BY METHYL SUBSTITUENTS.** The measured fluorescence spectra of biphenyl (BP) and para-terphenyl (PTP) in solution reveal with decreasing temperature first an increasing structure and a slight red shift and below the glass transition a loss in structure and a strong blue shift. The effect is discussed using a torsional potential scheme in agreement with QCFF/PI calculations. Comparison of the experimental blue shifts with the results of CNDO calculations suggest an incomplete hindrance of the relaxation process of the unsubstituted

molecules. A nearly perfect hindrance could be detected for the tetra-methyl substituted BP and PTP molecules. (Author abstract) 24 refs.

**075176 INTRAMOLECULAR EXCITED STATE CHARGE TRANSFER AND FLUORESCENCE DECA-Y OF p-CYANO-N,N-DIMETHYLANILINE IN MIXED HYDROCARBON/HALOCARBON SOLVENTS.** Fluorescence spectra, quantum yields and lifetimes of p-cyano-N,N-dimethylaniline (CDMA) were studied in various binary mixtures of n-hexane with chlorinated hydrocarbons. Solvent effects on the equilibrium between normal emission and fluorescence originating from the highly dipolar twisted internal charge transfer (TICT) state arise predominantly from non-specific solute-solvent interactions. The non-radiative deactivation rate of the TICT state is affected primarily by the solvent composition and slows down with the stabilization of the TICT state in environments of high polarity. **075178 CHARGE-TRANSFER EXCITONS IN MIXED-STACK DONOR-ACCEPTOR COMPOUNDS: A VARIETY OF SOLITONIC STATES.** Charge-transfer excitons (CTEs) strongly coupled to lattice phonons in quasi-1-d neutral mixed-stack compounds may self-trap, forming various large-radius solitonic states. Two types of symmetric solitons (denoted by  $S_0^-$ ,  $S_n^+$ ) and dimerized ones (D) are described together with the areas of crystal parameters at which they exist. The exact discrete spectra  $\Omega_n$ ,  $n=0,1,\dots$ , of local optical vibrations bound to S-solitons are found. A general problem of several exciton states mixing in quasi-1-d systems in the presence of the strong exciton-phonon interaction is also discussed for the examples of site excitations in coupled-chain-composed substances and mixed CTE-Frenkel excitons. Known estimates and experimental data distinguish CTEs as the most appropriate candidate for soliton formation compared to other molecular excitations in quasi-1-d. (Edited author abstract) 34 refs.

**075179 PICOSECOND SPECTROSCOPY OF POLARITONS IN ANTHRACENE CRYSTALS II. LUMINESCENCE.** The low-temperature luminescence

spectrum of anthracene crystals is investigated by applying simultaneous time and frequency resolution. The complicated kinetics of the emission in the polariton bottleneck region reflects directly the evolution and relaxation of the polariton distribution in the crystal. Three distinct relaxation stages are distinguished: (1) the ultrafast decay of initial vibronic excitations, mediated by optical phonons and resulting in a broad distribution of polaritons near the band bottom; (2) the formation of a narrow distribution of polaritons with a characteristic time of 30 ps, which is caused by scattering on acoustic phonons; (3) relaxation through the bottleneck region on a subnanosecond time scale. It is suggested that the polaritons immediately below the resonance frequency are responsible for the observed excitonic energy transfer in anthracene crystals. (Author abstract) 41 refs.

**075180 SOLID STATE ROOM-TEMPERATURE FLUORESCENCE OF p-OLIGOPHENYLENES AND OF POLY (PARAPHENYLENE) FILMS PREPARED ELECTROCHEMICALLY.** Fluorescence excitation and emission spectra of p-terphenyl, p-quaterphenyl and p-quinquephenyl were measured in sodium chloride pressed pellets at room temperature (293 K). Significant red-shifts of fluorescence spectra are found, upon increasing the number of phenyl rings in the oligomer chain. Polyparaphenylene (PPP) films were prepared by a new method of electro-oxidation of p-terphenyl in dichloromethane. Their solid-state fluorescence excitation and emission spectra were determined at room temperature. The excitation wavelength-dependent changes of fluorescence emission bands as well as their highly structured components are attributed to the occurrence in the excited singlet state of a variety of planar or nearly planar configurations of PPP films with relatively long chains. (Author abstract) 21 Refs.

**075182 DATA SYSTEM FOR IMAGING ORGANIC ANALYSIS WITH A SECONDARY ION MASS SPECTROMETER.** A data system is described for a custom-built secondary ion mass spectrometer assembled with a microcomputer, plug-in data acquisition and control cards, and a commercial scientific software system. Capabilities and limitations of this system are described. (Author abstract) 5 Refs.

Flurer, R.A. (Indiana Univ, Bloomington, IN, USA); Busch, K.L. *Anal Instrum (New York)* v 17 n 3 1988 p 255-276.

**075183 FLUORESCENCE INVESTIGATION OF THE CHROMATOGRAPHIC INTERACTIONS OF NITROGEN HETEROCYCLES WITH DEACTIVATED SILICA.** Solid-surface fluorescence spectroscopy was used to study the chromatographic interactions of benzo[f]quinoline (B[f]Q) and benzo[h]quinoline (B[h]Q) with water-deactivated silica gel. The results indicated that some of the water was adsorbed on sites in silica that were incapable of proton donation to B[h]Q in the excited singlet state. It was also found that solute localization became more important on the water-deactivated silica.

By combination of the luminescence data and the chromatographic data, the mass balance was calculated for three B[h]Q species responsible for the chromatographic bands. Spectral evidence was also obtained that supported a displacement-type of chromatographic mechanism for the systems investigated. (Author abstract) 22 refs.

**075187 TEMPERATURE PROGRAMMED PYROLYSIS-MASS SPECTROMETRY.** Temperature programmed pyrolysis performed close to the ion source of a mass spectrometer is a rapid and sensitive method for the analysis of involatile organic materials. The pyrolysis products directly enter the source as they are evolved and are rapidly analyzed so that both temporal and temperature resolution are possible. The technique requires little sample preparation and be used to characterize complex

mixtures of materials. The method can be simply used in the fingerprinting mode or the evolution of species can be related to the rate of thermal degradation. Applications of temperature programmed pyrolysis-mass spectrometry to the analysis of materials of interest in defense quality assurance will be described together with the instrumentation available. The advantages of temperature resolution in the analysis of samples such as polymers, lubricants and their additives is demonstrated. (Edited author abstract) 16 refs.

**075188 LUMINESCENCE OF NEUTRAL AND PROTONATED AMINOQUINOXALINES.** Stationary and time-resolved luminescence methods were used to investigate various protonated forms of 2-aminoquinoxaline and 2,3-diaminoquinoxaline. Proton attachment to 2-aminoquinoxaline monocation was discovered in the first excited singlet electronic state. Three different protonated structures of 2,3-diaminoquinoxaline were observed. (Author abstract) 4 refs.

**075197 ONE-AND TWO-PHOTON FLUORESCENCE EXCITATION SPECTRA OF MULTICHROMOPHORIC MOLECULES.** The splittings in  $S_1$  states of molecules containing weakly coupled  $\pi$ -chromophoric groups have been determined through one- and two-photon fluorescence excitation (OPF and TPF) spectroscopy. The  $1_{B_{2u}}$  state of benzene splits by about  $140\text{ cm}^{-1}$  in the dimer, dihydroanthracene (DHA) and by about  $2500\text{ cm}^{-1}$  in the strained trimer, triptycene (TR). While the exciton splitting in the trans-dimer of

acenaphthylene (TDA), in which the two naphthalene moieties are linked by two ethylene bridges, is only  $130\text{ cm}^{-1}$ , no such near degeneracies are noticed in two-methylene-bridge-linked dihydrodibenzanthracene (DBA) or dihydropentacene (DHP). (Author abstract) 4 refs.

**075198 CHANGES OF THE SITE DISTRIBUTION INDUCED BY HOLE BURNING.** In this work we propose a different method to determine the distribution of energy shifts during holeburning. It proceeds in several steps: First, we excite the sample with white light and measure the resulting broad band fluorescence spectrum. White light excitation ensures, that all molecules are excited with equal probability. Then we start the holeburning with the laser, constantly measuring the resulting site-selection fluorescence spectrum. Finally, we excite the sample again with white light and measure the fluorescence spectrum, which is now changed due to the holeburning. 1 ref.

**075200 STUDY ON PHOTOSENSITIZED TRIPLET-TRIPLET ABSORPTION OF NAPHTHYLALKANES.** The photosensitized triplet energy transfer and photochemistry processes from Benzophenone to naphthylalkanes are studied by laser flash photolysis and calculated relative constants. It seems the molecular structure affects the energy levels of the excited state. When the two naphthalene rings of bis-(2-naphthyl)propane are coplanar and close to each other, the interaction of the electron clouds stabilizes the excited state. When the hydrogen is substituted for the acetoxy group in 1-position of the alkane (in the case of ANP or AMN), the coplanar conformation is preferred. 2 refs.

**075201 CHARACTERIZATION OF AGGREGATES AND THEIR IMPORTANCE FOR ENERGY TRANSPORT IN CHEMICALLY MIXED CRYSTALS.** Chemically mixed crystals of dichlorobenzene (DCB) in dibromobenzene have been investigated over the concentration range from 0.01 to 10%. DCB guest molecules induce energy funnels for triplet energy transport. Phosphorescence excitation spectroscopy reveals that guest aggregates formed at higher concentrations induced the same kind of energy funnels as monomers. Optical shifts of DCB aggregates relative to monomers are

mainly determined by crystal field effects whereas changes in ODMR frequencies are due to exchange interactions. (Author abstract) 8 refs.

**075202 ENERGY TRANSFER BY TWO KINDS OF EXCIMERS IN PYRENE CRYSTALS.** The decay curves of the host and guest fluorescence in perylene doped pyrene crystals were nearly equal in each concentration and fitted with two exponential functions in high concentration. From the dependence of the two decay times on the temperature and doped concentration, we propose that the fast decay component is due to the energy transfer from host to guest through a different excimer. (Author abstract) 2 refs.

**Spectrum Analysis** See Also FLUORESCENCE—Spectrum Analysis.

**075206 IR SPECTRA STUDY OF THE HYDROGEN BONDS IN OXIMES.** The spectral parameters of the  $\nu(\text{OH}\cdots)$  bands of oximes when hydrogen bonds (HB) are formed with bases have not been measured previously. In order to determine the spectral parameters of  $\nu(\text{OH})$

bands of a complex containing a HB and a self-associate of oximes it is necessary to take into account the complex structure of the entire band. Taking this into account we have measured in this investigation the integrated intensities and first moments (centers of gravity) of the  $\nu(\text{OH}\cdots)$  absorption bands of the oximes of acetone (I) and cyclohexanone (II). 12 refs.

**075208 ELECTRON TRANSITIONS IN THE SPECTRA OF DIARYL-SUBSTITUTED.** The present work outlines the results of quantum-chemical calculation of the excited electron states of 2,5-diaryl-substituted 1,3,4-oxadiazole, containing phenyl and naphthyl radicals in various combinations. Analysis of the transitional density matrices allow the following quantitative interpretation to be given for the spectra of diaryl-substituted oxadiazole. The lowest intense transition is of whole-molecule type and is due both to excitation of P-electron systems of individual fragments and to significant charge transfer between them. In the short-wave region, low-intensity transitions  $B_2$  and  $N_2$  appear, overlapping the long-wave band. The bands of compounds II, III, and V observed experimentally in the region 36,000-38,000  $\text{cm}^{-1}$  [7] are due to  $N_p$  transitions. The lack of pronounced absorption in the given region for compound IV is due to the low intensity of the transitions  $H_p(S_0 \rightarrow S_4^*, S_0 \rightarrow S_6^*)$ . 8 refs.

Pedash, V.F.; Pedash, Yu.F. *J Appl Spectrosc* v 46 n 4 Apr 1987 p 403-406.

**075209 VIBRATIONAL SPECTRA AND ROTATIONAL ISOMERISM OF ETHYL DICHLOROTHIOPHOSPHITE  $\text{C}_2\text{H}_5\text{SPCl}_2$  AND TRIETHYL TRITHIOPHOSPHITE  $(\text{C}_2\text{H}_5\text{S})_3\text{P}$ .** In order to accumulate further data on the internal rotation around the  $\text{P}(\text{III})\text{S}$  bond and to study how it is affected by the sizes of the alkyl radicals at the S atom we studied the vibrational spectra and rotational isomerism of the molecules  $\text{C}_2\text{H}_5\text{SPCl}_2$  (IV) and  $(\text{C}_2\text{H}_5\text{S})_3\text{P}$  (V). We also derived a transferable set of force constants of the fragment  $\text{C}_2\text{H}_5\text{SP}(\text{III})$ . 12 refs.

Filippova, E.A.; Katsyuba, S.A.; Shagidullin, R.R.; Sinyashin, O.G. *J Appl Spectrosc* v 46 n 5 May 1987 p 467-471.

**075210 CONCENTRATION QUENCHING OF THE TRIPLET STATE OF Pd-TETRAPHENYLCHLORIDE IN LIQUID SOLUTIONS.** We measured the dependence of the rate constant of the deactivation of the lowest triplet state of Pd-TPhC on its concentration in toluene and dioxane at room temperature. We conclude that the observed concentration quenching of the triplet state of Pd-TPhC is due to the formation of a complex from molecules in the triplet and ground states. Comparison of the experimental data with the analysis results confirms the realization of this mechanism of concentration quenching. 9 refs.

Sapunov, V.V.; Egorov, G.D. *J Appl Spectrosc* v 46 n 5 May 1987 p 519-522.

**075211 IR SPECTRA OF IRRADIATED ORGANIC MATERIALS.** We present IR spectra (4400-400  $\text{cm}^{-1}$ ) of organic materials, both commercial and newly produced in the laboratory, and their changes due to fast ion

bombardment. The results indicate in particular: a preferential loss of hydrogen, darkening, amorphization, a rearrangement in the molecular structure. Some astrophysical applications and observations from space missions are suggested. (Author abstract) 16 refs.

Strazzulla, G. (Citta Univ, Catania, Italy); Massimino, P.; Spinella, F.; Calcagno, L.; Foti, A.M. *Infrared Phys* v 28 n 3 May 1988 p 183-188.

**075212 IR AND/OR NMR SPECTRA-STRUCTURE CORRELATIONS FOR ORGANONITROGEN-CONTAINING COMPOUNDS.** IR and/or NMR spectra-structure correlations have been developed which aid in the elucidation of molecular structure of organonitrogen-containing compounds. (Author abstract) 10 refs.

Nyquist, Richard A. (Dow Chemical Co, Midland, MI, USA). *Appl Spectrosc* v 42 n 4 May-Jun 1988 p 624-634.

**075213 FT-IR AND FT-NMR STUDY OF ORGANOPHOSPHORUS SURFACE REACTIONS.** Fourier transform infrared (FT-IR) and Fourier transform nuclear magnetic resonance (FT-NMR) methods were used to examine the adsorption and reaction of diisopropyl fluorophosphate (DFP) on various solid adsorbents. Static and flow system experiments were monitored with the use of FT-IR to determine DFP adsorption rates and isotherms on silica, coated silicas,  $\gamma$ -alumina, coated aluminas, and activated charcoal. The adsorption of DFP(g) onto the solid adsorbents was generally rapid, with a half-life of 20 s for 1 mg DFP onto 25 mg of 350  $\text{m}^2/\text{g}$  silica. The DFP adsorption isotherm on silica indicated chemisorption to a monolayer at  $P/P_0 < 0.6$ , followed by increased coverage that appears to be physical adsorption. Diffuse reflectance infrared Fourier transform (DRIFT) spectroscopy, photoacoustic spectroscopy (PAS), and solidstate  $^{31}\text{P}$  NMR of adsorbed DFP showed chemisorption on silica and on alumina. Bonding at the  $\text{P}=\text{O}$  of DFP was indicated by a  $-41 \text{ cm}^{-1}$  shift in the  $\nu(\text{P}=\text{O})$  and a 1-ppm upfield shift in the  $^{31}\text{P}$  resonance. DRIFT, PAS kinetics, and  $^{31}\text{P}$  NMR showed that DFP hydrolyzed after the initial adsorption on alumina and some coated materials but not on silica or activated charcoal. The rate of hydrolysis increased on alumina with addition of water and varied with different aluminas and coated silicas. (Edited author abstract) 19 refs.

**Stability** See Also CATALYSIS; DYES AND DYEING—Stability.

**075214 STABILITY OF ADSORPTION COMPLEXES FORMED BY ALCOHOLS ON H-ZSM-5.** The stability of adsorption complexes formed by alcohols in H-ZSM-5 has been investigated by using a titration/displacement technique. In this experiment, the ability of probe molecules to displace a given adsorbate from a complex at a zeolite hydroxyl site is examined. TPD and  $^{13}\text{C}$  NMR are used to measure the coverages of the alcohols following sequential or competitive adsorption experiments. The results show that there is a clearly defined ordering in the ability of alcohol molecules to displace one another at the adsorption site, and this ordering appears to follow the relative strengths of the zeolite/adsorbate interactions. Displacement orders correlate with the gas-phase proton affinities for alcohols with three or fewer carbon atoms in the hydrocarbon chain. However, as the carbon chain length increases, interactions between the carbon backbone and the zeolite channel walls become increasingly important in directing the course of the displacement reactions. (Author abstract) 18 refs.

## Standards

**075215 PROCEDURES FOR DEFINING FSE STANDARDS.** Formal steric enthalpies (FSE's) of a given class of molecules are defined in terms of FSE values assigned to standards. As an aid to selecting standard molecules and in determining appropriate FSE values for them, a procedure has been developed for the systematic generation of molecules that incorporate specific structural groups, for identifying all heavy atom torsions of the conformer (usually) of minimum energy, and for assigning gauche enthalpies to the torsions. The estimates of gauche enthalpies are derived by an interpolation procedure which provides a consistent set of values. Three programs FSEUNITA.BAS, FSEUNITB.BAS AND FSEUNITC.BAS together with a data set of TORSION.DAT define the procedures. (Edited author abstract) 11 refs.

**075217 FURTHER DEVELOPMENT OF STRUCTURE GENERATION IN THE AUTOMATED STRUCTURE ELUCIDATION SYSTEM CHEMICS.** The automated structure elucidation system CHEMICS has been expanded to allow the compound with all or any of the elements C, H, O, N, S, and the halogens to be analyzed. To realize the improvement, a new set of primary, secondary, and tertiary components to be used commonly for both spectral analyses and structure construction was established. Twelve attributes of the components were prepared for the determination of the bonding priorities between the components. This makes it possible to construct a tertiary component by giving an attribute of bonding partner to a secondary component. A new structure generator for the improved system has been developed on the basis of the established components set, using the authors' connectivity stack method. (Edited author abstract) 9 refs.

**075220 STRUCTURAL PROPERTIES OF ADSORBED LAYER OF ALBUMIN ON SURFACE OF HEMOSORBENT.** A study has been made of the adsorption of serum albumin on particles of activated carbon that are used for sorptive purification of blood. The properties of the adsorbed layers have been investigated by means of viscometric and electrophoretic measurements. The possibilities for application of these methods in adsorption studies have been examined critically. The geometric character of the protein molecule location in the adsorbed layer has been determined. An interpretation of a microelectrophoretic experiment is proposed, through which the structural aspect of protein adsorption on solid surfaces can be examined quantitatively. (Author abstract) 38 refs.

**075221 SOLID STATE CHARACTERIZATION AND X-RAY CRYSTAL STRUCTURE OF A 1,1 COMPLEX OF TETRATHIAFULVALENE AND META-DINITROBENZENE (TTF-mDNB).** The preparation, properties and crystal structure of an insulating complex formed between TTF and meta-dinitrobenzene (mDNB) are described. This acceptor has an aromatic ground state, rather than the quinonoid ground-state structure of TCNQ and the halobenzoquinones, which are the established acceptors that form crystalline TTF complexes. This neutral complex has low conductivity,  $\sigma_{300} = 2.7 \times 10^{-9} \text{ S cm}^{-1}$ , and a mixed stack structure. (Edited author abstract) 17 refs.

**075222 STRUCTURE OF N-(n-PROPYL)-QUINOLINIUM-(TCNQ)<sub>2</sub> AT 100 K.** The structure of  $(C_{12}H_{14}N)(C_{12}H_4N_4)_2$ ,  $(NPrQn)(TCNQ)_2$ , has been determined at 120 K. TCNQ molecules are stacked along the b axis in tetramers containing two inequivalent molecules. The NPrQn molecules are situated between the TCNQ stacks. The geometry of TCNQ molecules does not change significantly in comparison with room-temperature values. There is an increased tetramerization in the low-temperature phase, thermal contraction taking place within tetramers only and not affecting inter-tetramer distances. The latter may be explained assuming a lattice distortion originating in exciton-exciton interactions, competing with thermal effects. (Edited author abstract) 12 refs.

## Sulfonation

**075223 DETERMINATION OF THE AMOUNT AND FORM OF ADDED SULFUR IN MODIFIED HUMATES.** The amount of sulfur introduced into modified humates has been determined. A method for determining sulfate in mixtures containing modified humic acids, sodium sulfite, and hydroxides has been developed on model mixtures. It has been shown by IR spectroscopy that the introduced sulfo groups are at-

tached to the aliphatic parts of the humic acid molecules. (Author abstract) 18 refs.

**075224 SYNTHESIS OF CARBON-11 LABELLED DIAZOMETHANE.** This work describes a method of synthesis of  $[^{11}\text{C}]$ diazomethane from  $[^{11}\text{C}]$ methane.  $[^{11}\text{C}]\text{CH}_4$  produced by irradiation of a  $\text{N}_2$ -5%  $\text{H}_2$  mixture with 20 Mev protons is converted into  $[^{11}\text{C}]\text{chloroform}$  by chlorination on pumice stone impregnated with  $\text{CuCl}_2$  at  $310^\circ\text{C}$ . The  $[^{11}\text{C}]\text{chloroform}$  reacts with hydrazine and potassium hydroxide in ethanol. The yield of the synthesis and the specific activity of  $[^{11}\text{C}]$ diazomethane are measured by formation of the methyl ester of 3-nitrobenzoic acid. Thirty percent of  $[^{11}\text{C}]$ methane is transformed into diazomethane 10 min after the end of bombardment. The specific radioactivity is 92-130 GBq/ $\mu\text{mol}$  (2.5-3.5 Ci/ $\mu\text{mol}$ ). (Author abstract) 5 refs.

**075225 MICHAEL ADDITION OF  $\beta$ -DICARBONYLS TO  $\alpha,\beta$ -UNSATURATED KETONES CATALYZED BY MIXED SPHERE  $\beta$ -CARBONYLENO-LATE DIPHOSPHINO METAL COMPLEXES.** The addition reaction of  $\beta$ -dicarbonyls to Michael acceptors is catalyzed by  $[\text{M}(\text{acac})_2]$  and  $[\text{M}(\text{acac})(\text{diphosphine})]^+$  complexes ( $\text{M} = \text{Ni}, \text{Cu}, \text{Pd}$ ) in the 60-120°C temperature range. The catalysts exhibit yields and selectivities towards the relevant Michael adduct generally superior to those given by the usual basic catalysts. The catalytic activity depends on the nature of M, and decreases in the order  $\text{Ni} > \text{Cu} > \text{Pd}$ . Catalytic activity of  $[\text{Ni}(\text{acac})(\text{dppe})]^+$  is maintained when the catalyst is anchored to an insoluble polymeric matrix. (Edited author abstract) 16 refs.

Basato, M. (CNR, Padua, Italy); Corain, B.; de Roni, P.; Favero, G.; Jaforte, R. *J Mol Catal* v 42 n 1 Sep 1987 p 115-125.

**075226 MOLECULAR MECHANISMS OF MTBE SYNTHESIS ON A SULPHONIC ACID ION EXCHANGE RESIN.** Molecular mechanisms of methyl t-butyl ether (MTBE) synthesis by methanol addition to isobutene in the gaseous and liquid phases are presented as an example of general and specific acid catalysis by sulfonated ion exchange resins, respectively. As an example of general acid catalysis, a concerted mechanism with a cyclical intermediate of six centers is proposed for this reaction in gaseous phase. It is based on the LHHW kinetic model determined for the reaction that explains rate data in a statistically significant fashion. Analysis of the significance of the LHHW model shows that it is thermodynamically consistent. Therefore, we can assume that the kinetic model is a simplified picture of the molecular process. (Edited author abstract) 39 refs.

Tejero, J. (Univ of Barcelona, Barcelona, Spain); Cunill, F.; Iborra, M. *J Mol Catal* v 42 n 2 Oct 1987 p 257-268.

**075227 SYNTHESIS OF AMINOANTHRAQUINONES BY HYDROGENATION OF THE CORRESPONDING NITRO DERIVATIVES.** In this work hydrogenation of nitroanthraquinones was studied in the presence of a palladium complex with an aminated chloromethylated copolymer of styrene with divinylbenzene (A), with palladium content of 1 mass %. Experimental data indicate that the rate of NAQ hydrogenation in ethanol is practically independent of the ratio. Thus, the influence of solvent adsorption on the hydrogenation of nitroanthraquinones to a first approximation can be disregarded. It is shown that the most suitable solvents for NAQ hydrogenation are alcohols and DMF. The reaction proceeds much more poorly in nonpolar aromatic hydrocarbons. A catalyst was also found which is capable of reducing all nitrogroups in nitroanthraquinones was obtained, substantially simplifying purification and isolation of 1-AAQ, since the separation and purification of aminoanthraquinones is substantially easier than nitroanthraquinones. 10 refs.

**075228 VAPOR-LIQUID EQUILIBRIUM IN BINARY SYSTEMS FORMED BY PRODUCTS OF THE SYNTHESIS OF EPICHLOROHYDRIN BY THE EPOXIDATION OF ALLYL CHLORIDE BY tert-BUTYL HYDROPEROXIDE.** To determine the possibility of isolating epichlorohydrin from the reaction mixture by the usual fractional distillation, we studied the vapor-liquid equilibrium in binary systems formed by epichlorohydrin with di-tert-butyl peroxide, isopropylbenzene, and isobutyric acid at  $P_{\text{still}} = 15.996$  kPa (120.0 mm Hg) and in the methanol-epichlorohydrin system at  $P = 101.308$  kPa (760.0 mm Hg). The experimental data on phase equilibrium in binary systems formed by epichlorohydrin with methanol, di-tert-butyl peroxide, isopropylbenzene, and isobutyric acid, checked according to the Van Ness method are presented. The experiments have established that all the indicated systems possess positive deviations from Raoult's law. In the di-tert-butyl peroxide-epichlorohydrin system, the presence of an azeotrope with minimum boiling point 51.15°C ( $P = 15.996$  kPa), containing 59.0% mole % of di-tert-butyl peroxide and preventing the isolation of epichlorohydrin in pure form under these conditions, was established. 13 refs.

**075229 COBALT-CATALYZED SYNTHESIS OF PYRIDINES FROM 1-ALKYNES AND NITRILES: SUBSTRATE STRUCTURE AND REGIOSELECTIVITY.** A 3,5-trisubstituted pyridine has been carried out of the influence exerted by the substrate structure on the regioselectivity of the synthesis of trisubstituted pyridines by cycloaddition of 1-alkynes (R-CCH) and nitriles (R'-CN) catalyzed by the complexes  $[\text{CoCp}^*(\text{C}_2\text{H}_4)_2]$ , (IVa) ( $\text{Cp}^* = \eta^5\text{-C}_5\text{H}_5$ ) and (IVb) ( $\text{Cp}^* = \eta^5\text{-C}_5\text{Me}_5$ ). In most cases two isomers, i.e., the 2,4,6- and 2,3,6-trisubstituted pyridines, form, whose distribution depends upon the steric and electronic effects induced by R and R'. From highly sterically hindered alkynes and nitriles only the 2,4,6-trisubstituted isomer is formed. When R is a strong electron-withdrawing group (COOMe), the 2,3,5-trisubstituted pyridine is formed in addition to the 2,4,6- and 2,3,6-trisubstituted ones, whose distribution can be varied by altering the steric features of nitriles. (Author abstract) 12 refs.

**075230 ELECTROSYNTHESIS OF ORGANIC COMPOUNDS: XII. SYNTHESIS OF SOME ARYLACETYLACETONE DERIVATIVES.** Electrosynthesis of some arylacetylacetone derivatives was carried out via the anodic oxidation of acetylacetone in absolute methanol containing 0.8 gm atom/e-v sodium metal in the

presence of selected aromatic compounds (benzene, toluene, o-xylene, naphthalene and anthracene) on platinum anode under controlled anodic potential value of  $+1.1 \pm 0.03$  v vs SCE at 20°C. The synthesized compounds were 3-phenyl 2,4-pentanedione, 3-(p-tolyl) 2,4-pentanedione, 3-(o-xylol) 2,4-pentanedione, 3-( $\alpha$ -naphthyl) 2,4-pentanedione and 3-(9-anthryl) 2,4-pentanedione. In addition, a small amount of dimerised and polymerized products was obtained. (Edited author abstract) 14 refs.

**075231 SYNTHESIS AND POLAROGRAPHIC BEHAVIOUR OF BENZOTHIAZOLYLAZOPYRIMIDINES.** The present paper deals with the synthesis and polarographic behavior of some benzothiazolylazopyrimidines. Synthesis of these compounds have been achieved by the condensation of 2-ABT(s) with 4-methyl-2-thiouracil and 6-hydroxy-4-methyl-2-methylthiopyrimidine. Their structures have been established on the basis of IR and NMR spectral studies. Polarographic studies were carried out in N,N-dimethylformamide. This work is of interest to biochemistry. (Edited author abstract) 15 refs.

Jain, Rajeev (Jiwaji Univ, Gwalior, India); Pandey, Pratibha. *J Electrochem Soc India* v 36 n 3 Jul 1987 p 179-183.

**075232 SYNTHESIS AND BIOLOGICAL ACTIVITY OF DICHLOROMALEIC ACID DERIVATIVES.** Dichloromaleic acid and its anhydride are widely used in production of herbicides and fungicides. In this investigation the authors used dichloromaleic anhydride (I) for synthesizing 2,3-dichloro-N-cyclohexylmaleamic acid (II) and its derivatives for evaluation of the biological activity of compounds of this series. The characteristics of the synthesized compounds are given and their structures were confirmed by IR and NQR  $^{35}\text{Cl}$  spectroscopy. A characteristic feature of the NQR  $^{35}\text{Cl}$  spectra of compounds (IV)-(VIII) is the lower region of the resonance frequencies of the  $^{35}\text{Cl}$  nucleus in comparison of the maleamic acid (II) itself; this is evidently due to the excess electron density on the anion and increase of the ionic character of the C-Cl bond. It was found that all the synthesized compounds acted as disinfectants. 3 refs.

Shagas, G.G.; Valitov, R.B.; Zlot-skii, S.S.; Davletshina, A.M. *J Appl Chem USSR* v 60 n 1 pt 2 Jan 1987 p 214-216.

**075233 BISACETALS OF AROMATIC DIOLS WITH TERMINAL ETHNYL GROUPS.** The authors have synthesized bisacetals of aromatic diols with ethynyl terminal groups by selective addition of hydroxy- and bisphenols at the double bond of the vinyl 2-propynyl diether of ethylene glycol (I). The synthesized ethynyl bisacetals (II)-(VI) are nondistillable liquids of moderate or low viscosity, ranging from colorless to dark, and capable of spontaneous hardening during prolonged storage, with formation of cross-linked polymers. Their physicochemical characteristics and the experimental conditions are given. Because of the quantitative yields of the products and the technological effectiveness and high selectivity of the process, it can be regarded as a promising route to synthesis of various ethynyl monomers from the readily available vinyl 2-propynyl diethers of glycols and various hydroxy compounds. This work is pertinent to polymer synthesis. 11 refs.

**075234 STUDY OF PRODUCTION OF ALKYL-PYRIDINES BY HETEROGENEOUS-CATALYTIC CONDENSATION OF ACETYLENE AND AMMONIA.** The purpose of this work was to study the principal kinetic relationships of formation of 2- and 4-methylpyridines from acetylene and ammonia under atmospheric pressure on a supported zinc-cadmium catalyst, intended for use in formulation of a mathematical model of the action of a displacement reactor with a fixed catalyst bed. The authors kinetic data were used for formulating the

mathematical model of acetylene conversion, taking into account deactivation of the catalyst with time. The model consists of the material-balance equation for acetylene and an equation describing deactivation of the catalyst. Operation of the apparatus in which 2-methylpyridine is produced can be represented by a steady-state model with ideal displacement, as its length is much greater than its diameter ( $L/D > 20$ ), and back-mixing through the catalyst bed does not occur. The condensation reaction is accompanied by decrease of volume, which leads to change of velocity of the gas phase along the reactor. Deactivation of the catalyst occurs during the process as the result of deposition of macromolecular and carbonaceous products on its surface. 9 refs.

**075235 SYNTHESIS AND PROPERTIES OF N-( $\beta$ -ALKYLTHIOETHYL) SUCCINIMIDES.** The authors have synthesized and characterized N-( $\beta$ -alkylthioethyl) succinimides and studied their inhibiting activity against hydrogen sulfide corrosion of steel oil-well equipment. They first synthesized the corresponding alkyl  $\beta$ -hydroxyethyl sulfides by the reactions of thiols with 2-chloroethanol in presence of alkali. Alkyl  $\beta$ -chloroethyl sulfides were then synthesized by the reactions of alkyl  $\beta$ -hydroxyethyl sulfides with thionyl chloride. N-( $\beta$ -alkylthioethyl)succinimides were synthesized by the reaction of sodium succinimide with alkyl  $\beta$ -chloroethyl sulfides in presence of isopropyl alcohol. The structures of the synthesized compounds were examined by IR spectroscopy while the purity was verified by elemental analysis and thin-layer and gas-liquid chromatography. The authors' investigation showed that they inhibit hydrogen sulfide corrosion of steel considerably, and that their inhibiting activity depends significantly on their structure. 9 refs.

**075236 LIQUID CHROMATOGRAPHIC OPTIMIZATION OF REACTION CONDITIONS FOR THE SYNTHESIS OF 2,2-DIMETHYL-N-BENZYL-MALONAMIDE, A NEW ANTICONVULSANT.** Reversed-phase liquid chromatographic (RP/LC) procedures are used to optimize the reaction conditions for the large scale preparation of 2,2-dimethyl-N-benzylmalonamide, 1. In acute studies using mice and rats, compound 1 is a very effective anticonvulsant agent. Large quantities of 1 (ca. 300 g) are needed for detailed studies of its chronic effects. LC monitoring of the synthesis of intermediate products and 1 result in the optimum use of reagents, increased product yields, and decreased reaction times. (Author abstract) 5 refs.

McMillian, Carl L. (Auburn Univ, Auburn, AL, USA); DeRuiter, Jack; Clark, C. Randall. *J Chromatogr Sci* v 25 n 11 Nov 1987 p 510-513.

**075237 MALEIC ANHYDRIDE CONVERSION BY V-P-O CATALYSTS.** The vapor phase conversion of maleic anhydride was studied using two model vanadium-phosphorus-oxygen (V-P-O) catalysts,  $\beta$ -VOPO<sub>4</sub> and (VO)<sub>2</sub>P<sub>2</sub>O<sub>7</sub>, and a series of industrial-type catalysts having P-to-V ratios of 0.9, 1.0, 1.1 and 1.2. Maleic anhydride was fed directly to an integral flow reactor using a molten maleic anhydride saturator system. Direct evidence for the combustion of maleic anhydride has been observed with the simultaneous production of maleic acid. The conversion of maleic anhydride increased with temperature, oxygen partial pressure, and residence time. The

incorporation of 'excess' phosphorus in industrial catalysts suppressed maleic anhydride combustion by stabilizing the  $(VO)_2P_2O_7$  phase. (Author abstract) 8 refs.

Moser, T.P. (US DOE, Ames, IA, USA); Wenig, R.W.; Schrader, G.L. *Appl Catal* v 34 n 1-2 Oct 15 1987 p 39-48.

**075238 SYNTHESIS OF HYDROXYAPATITE FROM RICE BRAN AS STARTING MATERIALS.** A hydroxyapatite (Hap) has been synthesized using as a P-source phytin contained in rice bran. Phytin was extracted from oilseed rice bran of 10g by a NaOH solution of 0.01N and 60°C. CaO of 2.0g was then added to the filtrate containing phytin to obtain precipitate. After rinsing and drying, the precipitate was finally fired in an electric furnace of 1000°C for 3 hours to obtain Hap powder of 0.8g. (Edited author abstract) 6 refs. In Japanese.

Matsumoto, Yoshitaka (Ritsumeikan Univ, Kyoto, Jpn); Yamagishi, Jun-ichi; Yamada, Fumiaki; Kaneko, Yasunari; Iwasaki, Hiromichi. *Chem Express* v 2 n 10 Oct 1987 p 655-658.

**075239 COMPLEXES WITH SUBSTITUTED 2,5-DIHYDROXY-P-BENZOQUINONES: THE INCLUSION COMPOUNDS  $[Y(H_2O)_3]_2(C_6Cl_2O_4)_3 \cdot 6H_2O$  AND  $[Y(H_2O)_3]_2(C_6Br_2O_4)_3 \cdot 6H_2O$ .** Single crystals of  $[Y(H_2O)_3]_2(C_6Br_2O_4)_3 \cdot 6H_2O$  and  $[Y(H_2O)_3]_2(C_6Cl_2O_4)_3 \cdot 6H_2O$  were grown in aqueous. The compounds are in principle isostructural. In Y chloranilate one additional water site is occupied as verified by X-ray single crystal structure analysis.  $Y^{3+}$  is nine-coordinated by three water molecules and six oxygen atoms of the bischelating  $(C_6X_2O_4)^{2-}$  ions ( $X=Cl, Br$ ). The coordination polyhedron is an only slightly distorted tri-capped trigonal prism. The connection of  $Y^{3+}$  with the dianions leads to infinite, corrugated layers. The layer stacking yields cage-like cavities in which water molecules are accommodated. Hydrogen bonds interlink adjacent layers. Further hydrogen bonds involve the entrapped water molecules. Differential scanning calorimetry measurements indicated a complicated dehydration process which caused destruction of the single crystals right from the start. (Edited author abstract) 17 refs.

Robl, Christian (Univ Muenchen, Munich, West Ger). *Mater Res Bull* v 22 n 11 Nov 1987 p 1483-1491.

**075240 SYNTHESIS OF ANISOLE BY LEWIS ACID CATALYZED DECARBOXYLATION OF METHYL PHENYL CARBONATE.** The authors report that methyl phenyl carbonate (MPC) can be decarboxylated to anisole using a Lewis acid catalyst. Dimethyl carbonate and diphenyl carbonate, resulting from disproportionation of MPC,  $CO_2$  and sometimes a small amount of phenol were also produced and characterised. The nature of the substituent on aluminum plays a vital role in both the conversion and selectivity of this reaction. The fact that diphenyl carbonate is formed with 45% selectivity when  $AlCl_3$  is used as a catalyst emphasizes the versatility of the new aluminum-based systems reported. 5 refs.

**075243 PREPARATION OF A CARBON-11 LABELLED NEUROHORMONE -  $[^{11}C]$ MELATONIN.** Melatonin, a hormone of the pineal gland, has been labelled with the positron-emitting radionuclide, carbon-11 ( $t_{1/2}=20.4$  min), for study in vivo by positron emission tomography. Thus a novel labelling agent,  $[^{11}C]$ acetyl chloride, was prepared by the carbonation of methylmagnesium bromide with cyclotron-produced  $[^{11}C]$ carbon dioxide followed by treatment with phthaloyl dichloride. Acylation of 5-methoxytryptamine then affords  $[^{11}C]$ melatonin, which is purified by HPLC and formulated for intravenous injection. The preparation requires 35 min from the end of radionuclide production. It provides  $[^{11}C]$ melatonin in 13% radiochemical yield (decay-corrected from  $^{11}CO_2$ ) and in high specific activity. Radiochemical and chemical purity were demonstrated by HPLC and TLC. The validity of the radiosynthesis was also confirmed by a parallel synthesis of  $[^{13}C]$ melatonin and examination of the product by  $^{13}C$ -NMR spectroscopy and mass spectrometry. (Author abstract) 20 refs.

Le Bars, D. (Hammersmith Hospital, London, Engl); Luthra, S.K.; Pike, V.W.; Luu Duc, C. *Appl Radiat Isot* v 38 n 12 1987 p 1073-1077.

**075244 CATALYTIC REARRANGEMENT OF TRIS-(2-SUBSTITUTED-2-PROPENYL) CYANURATES.** Allyl esters of cyanuric and isocyanuric acids are widely used as cross-linking additives in order to confer thermal stability and heat resistance on polymeric materials. This paper is concerned with the synthesis and rearrangement of tris-(2-methyl-2-propenyl) (I), tris-(2-fluoro-2-propenyl) (II) and tris-(2-chloro-2-propenyl) (III) cyanurates. Experiments show that introduction of a substituent in position 2 of the allyl group retards the rearrangement reaction in comparison with triallyl cyanurate. 10 refs.

**075245 CURRENT EFFICIENCY LOSSES IN INDIRECT ELECTROCHEMICAL PROCESSING.** There is considerable industrial interest in the indirect two-stage electrochemical process ('ex-cell' process) for the synthesis of organic compounds. One reason why this process has not become common is the loss in current efficiency observed in working processes due to organic matter present in the recycled electrolyte. In previous work it has been found that the loss in current efficiency using the  $Mn^{2+}/Mn^{3+}$  system in 88%  $H_2SO_4$  was due to the oxidation of the organic compounds (mainly to  $CO_2$ ) carried over with the electrolyte back to the electrochemical cell. In this work we extend the study in 50% w/w  $H_2SO_4$  and a simple relation is proposed which permits the calculation of the loss in current efficiency from the total organic carbon present in the recycled electrolyte. 6 refs.

Comninellis, Ch. (ETH, Lausanne, Switz); Plattner, E. *J Appl Electrochem* v 17 n 6 Nov 1987 p 1315-1318.

**075246 SYNTHESIS AND THERMAL CHARACTERISTICS OF NEW SULPHUR-CONTAINING BIS-MALEIMIDES.** New sulphur-containing aromatic bis-maleimides were synthesized, with various spacing between the reactive maleimide groups, and their thermal characteristics were determined in dependence on the length of the phenylsulphide fragment. By the methods of dynamic thermal analysis and of dynamic mechanical analysis it was found that the polymerization of the bis-maleimide double bonds occurs above  $T_m$  of the

crystalline and above  $T_g$  of the amorphous oligomeric bis-maleimides. In studies of the temperature dependences of  $E'$ ,  $E''$  and  $\tan \delta$  with bis-maleimides in a cardiac polyimide matrix, alignment of the bis-maleimides in a cardiac polyimide matrix, alignment of the bis-maleimide with the polymer matrix was revealed. (Edited author abstract) 20 refs.

**075247 SYNTHESIS AND REACTIONS OF SUBSTITUTED ACROLEINS.** In this work we examined methods for obtaining 2-alkylacroleins and their derivatives that would render these compounds as cheap and readily available products of organic synthesis. Using aldehydes we show that ethylene glycol, glycerin, and pentaerythritol in the presence of acid catalysts react primarily at the carbonyl group. Maximal yields (50-80%) were obtained when using the cation exchanger KU-2 as the acid catalyst, which also simplified the isolation of the desired products. The 2-alkyl-1,3-dioxacyclanes obtained are of particular interest as monomers, comonomers, and intermediate products of organic synthesis. 14 refs.

**075249 CONTINUOUS METHOD FOR PREPARATION OF  $C_{14}$ - $C_{18}$  AND  $C_{17}$ - $C_{20}$  SYNTHETIC FATTY ACID NITRILES.** The aim of this investigation was to develop a highly efficient catalytic process for the synthesis of synthetic fatty acid nitriles which would enable us to completely automate the engineering process and to obtain the desired end product in a high yield while avoiding the vacuum distillation stage. Experiments indicate that nitriles obtained from  $C_{14}$ - $C_{18}$  and  $C_{17}$ - $C_{20}$  fractions of synthetic fatty acids do not require vacuum distillation. The rate of nitrilation reaction is determined by the rate of desorption of the reaction water from active centers on the catalyst. 6 refs.

Bizhanov, F.B.; Ayazbaev, E.Kh.; Shubin, V.P.; Prnazarov, Zh. *J Appl Chem USSR* v 60 n 5 pt 2 May 1987 p 1110-1112.

**075250 PREPARATION OF NEW INTERCALATION COMPLEXES OF n-ALKYLAMINES WITH  $FeMoO_4Cl$  AND ELECTROCHEMICAL LITHIATION OF  $FeMoO_4Cl$ .** Organic derivatives of  $FeMoO_4Cl$  have been synthesized by reaction of n-alkylmonoamines on  $FeMoO_4Cl$ . The n-alkylmonoamine molecules form bilayers at room temperature with average chemical composition  $FeMoO_4Cl \cdot 1.7C_nH_{2n+1}NH_2$  ( $4 \leq n \leq 18$ ). The basal spacing depends upon the alkyl chain length and can be represented by a linear regression. From electrochemical lithium intercalation in  $FeMoO_4Cl$ ,  $LiFeMoO_4Cl$  has been obtained, it is consistent with the  $FeMoO_4Cl$  structure. Correlation between reduction rate,

structural phase transformation (tetragonal  $\rightarrow$  monoclinic) and variation of Fe-site symmetry ( $C_{4v} \rightarrow D_{4h}$ ) is discussed. (Edited author abstract) 23 refs.

**075251 SYNTHESIS OF ETHYLAMINE WITH A cw TUNABLE CO<sub>2</sub> LASER.** The successful synthesis of ethylamine with a cw tunable CO<sub>2</sub> laser is reported. This action occurs at normal pressure ( $\approx 5.32 \times 10^4$  Pa) and temperature ( $< 100^\circ\text{C}$ ). No catalyst is used. The experiment shows a high directionality of this reaction. No other product except ethylamine is yielded. A possible mechanism for this reaction is discussed. (Author abstract) 9 refs.

**075252 KINETICS OF THE SYNTHESIS OF BISPHENOL A.** The kinetics of the synthesis of bisphenol A from acetone and phenol on an ion-exchange catalyst promoted by partial neutralization of acid groups with 2-mercaptoethyl amine was investigated in the temperature range 50-85°C. A Langmuir-Hisheewood type rate equation was used for treatment of the experimental data. The rate constant and the adsorption coefficient of water as the reaction product are temperature dependent, while the adsorption coefficient of phenol and acetone can be regarded as constants within the given range of temperatures. The effect of adsorption of bisphenol A need not be included in the kinetic equation. The effect of the reverse reaction is apparent at temperatures higher than 70°C. The equation thus obtained may be used in a description of integral data up to high conversions. (Author abstract) 7 refs.

**075253 STUDY OF THE SYNTHESIS OF FLUORESCAMINE.** A shortened and improved route to the synthesis of fluorescamine is presented in this paper. Starting with diethylphthalate as raw material, the authors have prepared fluorescamine and its derivative, p-chlorofluorescamine, through condensation, epoxidation, ring cleavage, and spirocyclization in six steps instead of seven. The yield of the former has been raised to 15.8%, thus bringing about a two-fold increase over that reported in the literature and a considerable reduction in its production cost. (Edited author abstract) In Chinese. 9 refs.

**075254 CYCLOBUTANEDIYLS: A NEW CLASS OF LOCALIZED BIRADICALS. SYNTHESIS AND EPR SPECTROSCOPY.** Nine triplet cyclobutanediyls (I) have been synthesized and observed by matrix isolation EPR spectroscopy. The zero-field splitting (zfs) parameters provide detailed information on the spin densities in these structures. The observed zfs values can be quantitatively modeled by using a straightforward semiempirical scheme, as long as one explicitly incorporates the spin polarization effects known to be important in radicals such as allyl and benzyl. In addition, interpretable hyperfine coupling (hfc) has been observed in many cyclobutanediyls. Spectral simulation produces the hfc constants, which provide further information on spin distribution and indicate that the four-membered ring in I is planar. (Edited author abstract) 56 refs.

**075255 PREPARATION AND DETERMINATION OF THE COMPLEXING ABILITY OF N-BENZYL**

**DERIVATIVES OF METHIONINE.** To study the possibility of their use as passivators of metals in polyolefins, we synthesized a series of N-benzyl derivatives of methionine (I) and studied their complexing ability in the presence of Cu<sub>2</sub>Cl<sub>2</sub>. The data show that the synthesized compounds can react with copper ions with complexation, and, therefore, these compounds can be used as passivators of copper in a polymer. In a test in polypropylene films in the presence of 10% copper filings the synthesized compounds behaved as passivators. Thus, the time to onset of brittleness during aging at 150° in a thermal hood was 8-10 h for the film without the passivator additive and 29, 37, 31, and 46 h for films with 0.5% additions of products Ia-Ic, respectively. 2 refs.

**075256 INSPECTION OF CORROSION IN EQUIPMENT FOR THE SYNTHESIS OF HYDROXYLAMINE SULFATE.** In connection with the need to build domestic plants for the synthesis of hydroxylamine sulfate and to choose corrosion-resistant construction materials perfected by production for their manufacture, a series of research studies was carried out, including repeated inspections of operating equipment. After eighteen months of operation of the reactors, the condition of the body metal and internally installed systems was satisfactory. The corrosion rate of control samples made of 03Kh21N21M4GB sheet steel of different casts installed in the first reactors was not more than 0.001 mm/year. The change in thickness of the walls of the coil was not recorded. The results of the inspection confirm the correctness in choosing steel as the main construction material for the bodies of reactors for the synthesis of hydroxylamine sulfate and the feasibility of using 10Kh17 N13M2T steel for the internal systems of the reactors. 9 refs.

**075257 NEAR-INFRARED ELECTROPHOTOGRAPHIC PHOTORECEPTOR INCORPORATING A HYDROXY SQUARINE.** The synthesis and xerographic evaluation of bis(4-dimethylamino-2-hydroxy-6-methylphenyl) squaraine (HMS) is described. Significant photosensitivity enhancement is observed upon addition of certain phenols during the synthesis of the squaraine. Negatively charged dual layer photoreceptor devices incorporating doped HMS are characterized by excellent xerographic properties such as low dark decay ( $< 50$  V/sec), high white light and IR sensitivity ( $E_{70} \approx 5$  ergs/cm<sup>2</sup> at 830 nm) and good short-term cycling stability. The effect of charge generator layer thickness, pigment loading and nature of the polymer binder are discussed. (Author abstract) 14 refs.

**075258 NOVEL SYNTHESIS OF ISOTHIOCYANATES FROM AMINES USING TRIPHENYLPHOSPHINE/CARBON TETRACHLORIDE.** The authors describe an efficient and simple method for conversion of amines into isothiocyanates via dithiocarbamates, which are readily available from carbon disulfide and amines under mild condition. Two procedures, a one-pot method and a two-step method including the isolation of the dithiocarbamates, were examined to convert amines into isothiocyanates. Triethylammonium dithiocarbamate (RNHC(S)/S-HNEt<sub>3</sub>), which we prepared from aliphatic and/or aromatic amines, carbon disulfide and triethylamine, were treated with triphenylphosphine/carbon tetrachloride reagent in acetonitrile at room temperature to give the corresponding isothiocyanates in good yields. (Edited author abstract) 8 refs.

Noboru; Hashimoto, Shizunobu. *Chem Express* v 3 n 4 Apr 1988 p 215-218.

**075259 KINETIC STUDY OF THE SUBSTITUTION REACTION OF BENZYL CHLORIDE WITH TRIPHENYLPHOSPHINE TO SYNTHESIZE BENZYLTRIPHENYLPHOSPHONIUM CHLORIDE. SOLVENT EFFECTS.** Triphenylphosphine (TP) and benzyl chloride (BC) undergo S<sub>N</sub>2 substitution reaction to produce benzyltriphenylphosphonium chloride (BTTPC). The effects of solvent, reactant concentration, agitation rate, and temperature on the conversion rate are investigated in order to find the optimum operating conditions for this reaction. It is found that no agitation effect is observed when the agitation rate exceeds 700 rpm. The order of relative activities of solvents is methanol > acetic acid > dichloromethane > acetone > ether > benzene > toluene. In methanol, the conversion can be as high as 100% with respect to TP when BC is in great excess. The second-order rate constant at 30°C for the BC-TP reaction in methanol is 0.135 M<sup>-1</sup> h<sup>-1</sup>. (Edited author abstract) 14 refs.

Wang, Maw-Ling (Natl Tsing Hua Univ, Hsinchu, Taiwan); Liu, An-Hong; Jwo, Jing-Jer. *Ind Eng Chem Res* v 27 n 4 Apr 1988 p 555-559.

**075260 STRATEGY AND ALGORITHMS IN THE THERMODYNAMIC ANALYSIS OF THE EQUILIBRIUM IN THE INDUSTRIAL SYNTHESIS OF CARBAMIDE.** The authors present a strategy for calculating the equilibrium constants in the synthesis if the melt is considered as a nonideal solution. Wilson's equation has been used in an algorithm for calculating the phase-equilibrium constants for free ammonia and water over the liquid. The new relationships for these quantities as functions of temperature agree much better with experiment than those derived previously on the assumption that the molten mixture is ideal. The relationship for the phase-equilibrium constants can be used in calculating the optimum pressure and temperature, as well as for determining the composition of the vapor-gas mixture in the synthesis. 10 refs.

Stateva, R.P.; Kafarov, V.V.; Meshalkin, V.P. *J Appl Chem USSR* v 59 n 6 1 Jun 1986 p 1171-1176.

**075261 SYNTHESIS OF DITHIO(THIO)CARBAMATES OF ACYCLIC DI- AND POLYAMINES.** Alkali and heavy metal dithio(thio)carbamates of polyethylene polyamines were obtained and studied. These carbamates are of interest as complex forming agents, fungicides and stabilizers for polymeric materials. It was found that alkali metal dithio(thio)carbamates of acyclic polyethylenepolyamines form polymeric metal complexes with heavy metal salts. 4 refs.

**075262 RUTHENIUM-CATALYZED SYNTHESIS OF PIPERAZINES.** An alternate approach to the synthesis of the piperazine ring would be to consider the simple condensation of a 1,2-diol with a 1,2-diamine. In view of the potential pharmaceutical interest of piperazines, we decided to study this reaction in more detail. In a first stage, the catalyst effect on the synthesis of piperazine ( $R_1 = R_2 = R_3 = R_4 = H$ ) from the condensation of ethylene glycol and ethylenediamine was established. It is clear that ruthenium catalysis is essential to the reaction. The best catalyst is Ru<sub>3</sub>(CO)<sub>12</sub>. The presence of a suitable phosphine helps the reaction, the basic uncrowded tri-n-butylphosphine being the most efficient. 8 refs.

**075263 ACETYLENIC TELLURIDES: SYNTHESIS AND REACTIVITY.** Acetylenic tellurides were prepared by the reaction of lithium phenylacetylide with (p-methoxyphenyl)tellurium bromide or with elemental

tellurium, followed by alkylation of the intermediate lithium phenylacetylenetellurolate with primary or secondary alkyl halides. The acetylenic tellurides can function as either nucleophilic or electrophilic tellurium centers. Reaction of these intermediates with reducing agents, followed by air oxidation, gives dialkyl ditellurides in high yields, along with the tellurium-free phenylacetylene. Reaction of these intermediates with reducing agents under nitrogen, followed by reaction with alkyl halides, furnishes symmetrical and unsymmetrical dialkyl tellurides in high yields. The reaction of acetylenic tellurides with alkyl Grignard or alkyllithium reagents led to the formation of symmetrical or unsymmetrical dialkyl tellurides in good yields. (Author abstract) 24 refs.

**075268 INDIRECT ELECTROCHEMICAL EPOXIDATION OF HEXENE IN A LIQUID-LIQUID ELECTROLYTE.** Preliminary experiments have been carried out on the mediated electrolytic synthesis of 1,2-epoxy-hexane from 1-hexene. The electrochemical cell was an undivided parallel-plate reactor under galvanostatic operation at  $25^\circ\text{C}$  and 1 atm. The electro-active  $\text{Br}_2/\text{Br}^-$  couple acted as the mediating species. A dispersion of 1-hexene droplets in aqueous sodium bromide solution was generated by use of a static mixer. Current efficiency for organic species and chemical yield of epoxide were determined in order to investigate qualitatively the dependence of the overall electrolyzer performance upon flow rate, organic volume fraction, dispersed droplet size, and current density. (Edited author abstract) 17 refs.

**075270 MATHEMATICAL MODELING OF THE PAIRED ELECTRO-ORGANIC SYNTHESIS IN PACKED BED FLOW REACTORS.** A mathematical model for paired syntheses of 2-butanone from 2,3-butanediol in a packed bed flow reactor has been constructed. Model equations have been solved with a modified Shooting-Runge Kutta numerical technique. Model calculations of current efficiencies and species concentrations are in good agreement with the experimental results. Calculations show that anodic reactions occur mainly in the front end of the anode. Bromine and bromate formation at the anode and acetoin reduction and hydrogen evolution at the cathode are charge-transfer controlled. Rates of bromine and bromate reduction at the cathode are mass-transfer controlled. (Author abstract) 21 refs.

Yu, Jimmy C. (Univ of California, Los Angeles, CA, USA); Baizer, M.M.; Nobe, Ken. *J Electrochem Soc* v 135 n 6 Jun 1988 p 1392-1400.

**075271 MATHEMATICAL MODELING OF THE PAIRED ELECTRO-ORGANIC SYNTHESIS IN PACKED BED FLOW REACTORS.** The mathematical model has been applied to the paired synthesis of gluconic acid and sorbitol from glucose in a packed bed flow reactor. Good agreement between experimental results obtained previously and model predictions has been obtained. Model calculations show anode current efficiency is not a function of current density, whereas sorbitol current efficiency is strongly dependent on current density. Surface coverages of hydrogen on the Raney nickel powder cathode range from 0.7 to 0.8 at 1.75 mA/cm $^2$ ; glucose electrohydrogenation at  $60^\circ\text{C}$  is charge-transfer controlled. For a fixed quantity of Raney nickel, an increase in the cathode diameter results in increased sorbitol current efficiencies. (Author abstract) 12 refs.

**075278 SYNTHESIS AND CHARACTERIZATION OF 1,2-CYCLOBUTENEDICARBOXAMIDES: THERMALLY GENERATED POLYMERS AND DI-ELS-ALDER ADDUCTS.** A series of model diamides were synthesized from mono- and disubstituted amines with the diacid chloride of cyclobutene-1,2-dicarboxylic acid. Yields ranged from 30 to 70 percent. Melting points of the purified diamides ranged from less than 23°C for N-alkyl and N,N-dialkyl species to 204°C for the N-phenyl model. Relative rates of thermolysis (by DSC) with maxima from 208-224°C at 10°C/min were dependent on the number and type of substituents and on intramolecular hydrogen bonding. Thermolysis products were Diels-Alder dimers for N-monosubstituted materials and for bulky tetrasubstituted models and spontaneously formed polymers for two tetrasubstituted models with at least one methyl group on each nitrogen. (Edited author abstract). 15 Refs.

**075281 SYNTHESIS, STRUCTURE, AND EXCIMER FORMATION OF CHOLESTERIC LIQUID CRYSTALS CONTAINING CARBAZOLYL GROUPS COVALENTLY LINKED TO A CHOLESTEROL GROUP.** Cholesteryl 3-(9-carbazolyl)propanoate (9Cz-2) and cholesteryl 3-[3-(9-ethylcarbazolyl)]propanoate (3Cz-2) were synthesized. They did not show a cholesteric

mesophase by themselves, but their 1:1 mixture with other cholesteryl arylpropanoates showed cholesteric mesophases near room temperature. The average orientation of the two types of carbazoyl groups in the quasinematic layer were determined by circular dichroism and circularly polarized fluorescence spectroscopy. Their fluorescence spectra showed a monomer fluorescence with a small contribution of excimer. The intensity ratio of the excimer to monomer fluorescence of 3Cz-2 was larger than that of 9Cz-2 and reached the minimum value at the cholesteric-isotropic transition temperature. (Edited author abstract). 22 Refs.

**075282 METAL CATALYZED DEMETHYLATION OF N,N-DIMETHYLANILINE.** The demethylation of N,N-dimethylaniline (DMA) was examined over activated charcoal supported metal catalysts such as palladium, ruthenium, rhodium, and platinum. The palladium catalyst was the most effective for the formation of aniline (AN). The demethylation occurred to form aniline via N-methylaniline (MAN) by the stepwise degradation. A possible mechanism involving an iminium cation was proposed. TT Metal Catalyzed Demethylation of N,N-Dimethylaniline. (Author abstract). 10 refs. In Japanese.

**075283 REDUCTION AND HYDROGENATION WITH THE SYSTEM HYDROCARBON/CARBON.** Hydrocarbon/carbon systems can be readily used instead of molecular hydrogen and expensive metal catalysts for the hydrogenation of compounds containing, for example, CC-, CO-, or NO-double bonds. Furthermore, these systems can be used for carrying out reductions which hitherto required strong reducing agents such as zinc, tin, alkali metals and hydrides. Especially suitable as economic sources of hydrogen are refinery products such as vacuum gas oil, fuel oil S or vacuum residue oil. Hydrocarbons are dehydrogenated to unsaturated systems and finally to carbon. (Edited author abstract). 6 Refs.

**075284 NOVEL CATALYTIC REACTIONS USING RUTHENIUM AND PLATINUM COMPLEXES.** The following novel organic synthesis catalyzed by ruthenium or platinum complexes are reviewed: (1) activation of alcohols which provides novel synthetic methods for alkylamines and N-heterocycles such as piperidines, pyrrolidines, quinolines and indoles, (2) hydroamidation of olefins, (3) addition of carboxylic amides to olefins, (4) addition of aldehydes to olefins to give unsymmetric ketones. Reactions 3 and 4 involve the activation of carbon-hydrogen bond of formyl groups, (5) [2+2] cross cycloaddition of norbornenes with acetylene which provides the synthetic tool for linear polycyclic compounds, (6) linear codimerization of acetylenes with 1,3-dienes, (7) addition of carboxylic acids to acetylenes to give enol esters, (8) reductive carbonylation of nitroarenes to amides, urethanes and ureas, and (9) thermal and photo-chemical carbonylation of alkyl iodides to esters or aldehydes. (Edited author abstract). 55 Refs. In Japanese.

**075285 ORGANIC ELECTROCHEMISTRY IN THE SOLID STATE-OVEROXIDATION OF POLYPYRROLE.** Anodic overoxidation of polypyrrole in the presence of nucleophiles such as H<sub>2</sub>O, OH<sup>-</sup>, CH<sub>3</sub>OH, CH<sub>3</sub>O<sup>-</sup>, Br<sup>-</sup> and CN<sup>-</sup> has been studied in detail. At potentials up to 2.1 V (vs. SCE), irreversible anodic peaks

are observed with 200 nm layers on Pt. In most of the cases, a total of z=4-6 f/mol monomer unit initially oxidized in the reversible potential region to the radical cation has been evaluated. Only every third ring is involved in this way. Characteristic products in aqueous systems are pyrrolinones (with a keto group in 3-position), z=4, and product of further hydroxylation in 4-position (z=6). (Edited author abstract) 50 refs.

**075287 RECENT DEVELOPMENTS IN THE CHEMISTRY OF  $\alpha$ -ALKOXY AND  $\alpha$ -AMINOSUBSTITUTED ORGANOTINS DIRECTED TOWARDS ORGANIC SYNTHESIS.**  $\alpha$ -Heterosubstituted organotins are potentially interesting synthetic tools. New efficient and versatile routes to these reagents are presented. The syntheses involve the stannylation of organic substrates (orthoformates, aldehydes, aminoacetals or immonium salts) as well as the modification of doubly functionalized organotin compounds (e.g. diethoxymethyltributyltin or  $\alpha$ -chloro- $\alpha$ -ethoxymethyltributyltin) with organoaluminum reagents or Grignard reagents. The new organotins are shown to be efficient tools for organic synthesis after transmetalation with butyllithium or after direct (or catalyzed) reactions with various organic substrates. (Edited author abstract) 72 refs.

**075288 SIMULATION OF THE OPERATIONAL CHARACTERISTICS OF THE LARGE-SCALE MULTITUBULAR REACTOR FOR MALEIC ANHYDRIDE PRODUCTION.** The paper presents an analysis of the operational behavior of the industrial reactor for maleic anhydride synthesis. The kinetic model of the process carried at the elevated benzene concentrations (within the explosivity range) is proposed. The analysis is carried out on the base of the mathematical model of multitubular reactor taking account of thermal interaction between heat carrier flowing through the intertubular space and the reactants inside variously positioned catalytic tubes. The influence of process parameters as well as the effect of co-current and counter-current flow configurations on the operational characteristics of the industrial reactor is examined by means of numerical simulation. (Author abstract) 9 refs.

**075290 TEMPERATURE DEPENDENCE OF THE LEAKAGE OF CARBOXY FLUORESCIN FROM AN INNER AQUEOUS PHASE OF LIPOSOMES OR MIXED LIPOSOMES.** Small unilamellar liposomes with an average diameter of about 500 Å containing carboxy fluorescein in an inner aqueous phase were prepared by 20 min sonication (60 W) of the aqueous dispersions of dimyristoyl-, dipalmitoyl-, or distearoyl phosphatidylcholine. The excess carboxy fluorescein in an outer aqueous phase was expelled by a Sepharose CL4B column. The leaked carboxy fluorescein was analyzed successively by fluorescence spectroscopy at different temperatures. A rapid leakage was observed at the main phase transition temperature. On the other hand, little leakage was recorded below and above the phase transition temperature. (Edited author abstract) 21 refs.

**075291 THERMALLY INDUCED REARRANGEMENT OF  $\alpha$ -ZIRCONOCENYL THIOETHERS: CARBON-CARBON BOND FORMATION VIA A TRANSITION-METAL HYDROXYMETHYL OR METALLOXIRANE ANALOGUE.** The authors examined the thermolysis of  $\alpha$ -zirconocenyl thioethers to gain insight into the basic reactivity patterns of  $\alpha$ -heteroatom-substituted alkyl groups in highly oxophilic transition-metal complexes. In recent preliminary reports, we have shown that  $\alpha$ -zirconocenyl thioethers undergo carbon-carbon bond-forming reactions 1 and 2, which are potentially good models for carbon-carbon bond formation via a hydroxymethyl metal or metalloxirane complex. In this work the authors report on studies of one particular bond-forming reaction. Based on experimental data, the authors conclude that the rearrangement proceeds by intramolecular nucleophilic attack (migration) of the aryl group to the methylene carbon with commensurate breaking of the C-S bond. (Edited author abstract) 20 refs.

## Thermal Properties

**075292 ESTIMATION OF THE BOILING TEMPERATURE AT NORMAL PRESSURE FOR ORGANIC COMPOUNDS FROM THEIR CHEMICAL FORMULA AND A KNOWN BOILING TEMPERATURE AT LOW PRESSURE.** A simple and accurate method to predict the normal boiling temperature  $T_b$  of organic compounds from their chemical formula and a known boiling temperature at low pressure is proposed. The bases of the method are Clausius-Clapeyron's equation, Lydersen's group contribution correlations and a statistical decrement  $\Delta T_b$ . From a known boiling temperature under a known low pressure (which is a common case), a predictive method is thus provided to estimate the unknown normal boiling temperature of such compounds, which cannot be experimentally measured. The observed standard error for compounds with known normal boiling temperature is  $\pm 3$  K. (Author abstract) 15 refs.

**075293 THERMAL PROPERTIES OF TETRAKIS (ALKYLTHIO)TETRATHIAFULVALENES.** Thermal properties have been investigated for a series of tetrakis (alkylthio)tetrathiafulvalenes which consist of a TTF  $\pi$  system and four alkylthio substitutional groups with n carbon atoms (abbreviated TTC<sub>n</sub>-TTFs (n=1-18), by means of differential scanning calorimetry. The linear dependence of the enthalpy and entropy changes at the melting point,  $\Delta H_m$  and  $\Delta S_m$ , is observed, which is consistent with the behavior of flexible molecules reflecting the contribution from the configurational change in alkyl chains of TTC<sub>n</sub>-TTFs to the entropy change at the melting point. The n dependence of the melting point, in addition to that of  $\Delta H_m$  and  $\Delta S_m$ , suggests that the series of TTC<sub>n</sub>-TTFs are divided into two subgroups depending on n. (Edited author abstract). 16 Refs.

## Thermoanalysis

**075294 COMMON THERMOANALYTICAL CHARACTERISTICS OF DURABLE PRESS REACTANTS BASED ON CYCLIC UREAS.** Thermal analyses, including differential scanning calorimetry (DSC), thermogravimetry (TG), and differential thermogravimetry (DTG), were performed on a series of derivatives of cyclic ureas under nitrogen. Such compounds are used extensively for durable press finishing of cotton textiles. Three common features were discovered in 15 compounds analyzed. The amount of residue produced in TG analyses was related to structure and indicated that thermally induced polycondensations were occurring. (Edited author abstract) 15 refs.

**075297 MODIFIED UNIFAC GROUP-CONTRIBUTION MODEL FOR PREDICTION OF PHASE EQUILIBRIA AND HEATS OF MIXING.** The Modified UNIFAC model for predicting activity coefficients presented in this work is based on the well-known UNIFAC model. Two changes are introduced in Modified UNIFAC: (1) the group-interaction parameters have been made temperature-dependent and (2) the combinatorial term is slightly modified. Group-interaction parameters have been determined for 21 different main groups. It is shown that Modified UNIFAC gives somewhat better predictions of vapor-liquid equilibria than does UNIFAC, while the predictions of excess enthalpies are much improved. (Edited author abstract) 32 refs.

**075298 ALDEHYDE-BISULFITE ADDUCTS: PREDICTION OF SOME OF THEIR THERMODYNAMIC AND KINETIC PROPERTIES.** Stability constant ( $K_1$ ) for the reaction of acetaldehyde and hydroxyacetaldehyde with NaHSO<sub>3</sub>, determined spectrophotometrically in aqueous solution, were found to be  $(6.90 \pm 0.54) \times 10^5$  M<sup>-1</sup> and  $(2.0 \pm 0.5) \times 10^6$  M<sup>-1</sup>, respectively, where  $K_1$  (corrected for aldehyde hydration) =  $[RCH(OH)SO_3^-]/[RCHO][HSO_3^-]$  ( $\mu=0.2$  M; 25°C). Acid dissociation constants ( $pK_{a3}$ ) of a series of  $\alpha$ -hydroxyalkanesulfonate salts,  $RCH(OH)SO_3^-$ , were found to be 11.46 (CH<sub>3</sub>-), 11.28 (H-), 10.30 (HOCH<sub>2</sub>-), 10.33 (C<sub>6</sub>H<sub>5</sub>-), 10.31 (CH<sub>3</sub>CO-), and 7.21 (Cl<sub>3</sub>C-) ( $\mu=0$  M; 25°C). Simple straight-line relationships were found to exist between Taft's  $\sigma^*$  parameter and a number of thermodynamic and kinetic properties of some aldehydes. Additional aspects of the subject are discussed. (Edited author abstract) 47 refs.

**075300 SIMULTANEOUS OPTIMIZATION OF BINARY PHASE EQUILIBRIUM AND THERMODYNAMIC DATA FOR ORGANIC SYSTEMS.** A technique is proposed which permits the simultaneous optimization of all available VLE, LLE, excess enthalpy, and other liquid excess property data for binary systems. The method permits the analysis of the complete range of experimental temperatures, pressures, and compositions. The result is a single set of self-consistent parameters for a power-series expression for the excess Gibbs energy which will reproduce experimental data with precision and can be used for extrapolations with confidence. The method is illustrated by examples including the following systems: hexane + acetone; 2,3-dimethylbutane + acetone; ethylbenzene + 2-ethoxyethanol; ethanol + ethyl acetate; hexane + hexadecane; water + 1,4-dioxane; benzene + toluene; and water + 2-butanone. (Author abstract) 68 refs.

**075301 THERMODYNAMIC PROPERTIES OF 1-CHLORO-1,2,2,2-TETRAFLUOROETHANE (R124).** The critical temperature and pressure, vapor pressure, and PVT relations for gaseous and liquid 1-chloro-1,2,2,2-tetrafluoroethane (R124) were determined experimentally. The vapor pressure was measured in the temperature range from 278.15 K to the critical temperature. The PVT measurements were carried out using two types of volumeters in the temperature range from 278.15 to 423.15 K, at pressure up to 100 MPa. The numerical PVT data of gaseous state are fitted as a function of density to a modified Benedict-Webb-Rubin equation. The pressure-volume relations of the liquid at each temperature are correlated satisfactorily as a function of pressure by the Tait equation. The critical density and saturated vapor and liquid densities are also determined and some of the thermodynamic properties are derived from the experimental results. (Author abstract) 5 refs.

**075302 DIRECT PATTERNING AND ELECTRICAL PROPERTIES OF PHTHALOCYANINES THIN FILMS PREPARED BY LANGMUIR-BLODGETT AND SPIN CAST TECHNIQUES.** The patterning and electrical properties of thin films based on two new highly soluble nickelphthalocyanines involving four long alkyl amides (AmPc1 and AmPc2) have been examined. The films were prepared using the Langmuir-Blodgett and spin cast techniques. The film conductivities increased by 2-4 orders of magnitude upon iodine vapor exposure and reached ca.  $10^{-6}$  S  $\text{cm}^{-1}$ . Both the AmPc1 and AmPc2 thin films showed negative patterning features to electron beam (EB) dose, and excellent resistance to plasma-assisted dry etching. The AmPc2 possesses high contrast in a LB film ( $\gamma=3.8$ ) and high reactivity ( $D_0=3.5$   $\mu\text{C cm}^{-2}$ ) in a spin cast film. The fine patterns in the AmPc2 spin cast film have been fabricated down to lines with widths of 0.8  $\mu\text{m}$  (with a 0.8  $\mu\text{m}$  spacing) using EB irradiation and wet etching, while (probably) maintaining the semiconducting properties of the Pc ring moieties without decomposition. (Author abstract) 38 refs.

**075304 OPTICAL PROBES OF ORGANIC THIN FILMS: PHOTONS-IN AND PHOTONS-OUT.** This monograph attempts to present a comprehensive review of the current applications and characteristics of photon-in, photon-out optical techniques used to characterize organic thin solid films and their interfaces. The optical probes are grouped according to their common origins within the point dipole approximation and both theoretical aspects and experimental capabilities and limitations are discussed. Emphasis is given to describing how information about the surface and interface characteristics, the thin film microscopic physical structure and the macroscopic optical properties derives from nine basic optical approaches used in some two dozen different

experimental configurations. The level of presentation is directed at nonexperts in the multidisciplinary research and technology fields which utilize organic thin films in the submonolayer to micron thickness range. (Edited author abstract) 638 refs.

**075305 ABSORBING ORGANIC LIGHT FILTERS FOR THE VISIBLE PART OF THE SPECTRUM.** Absorbing light filters on the basis of organic film-forming compounds and chromophors are promising for mass production. Such filters are characterized by high reproducibility of the spectral characteristics, they are subtractive and therefore are free of secondary interference phenomena which cause uncontrollable changes in chromaticity, and they can be manufactured at low cost. We have developed absorbing light filters of the cut-off type with  $\lambda_{\text{lim}} = 490 \pm 10$  and  $600 \pm 20$  nm transmitting the long-wave part of the spectrum, and band filters with  $\Delta\lambda_{1/2}$  approximately 80 nm for the green ( $\lambda_{\text{max}} = 530 \pm 10$  nm) and blue ( $\lambda_{\text{max}} = 450 \pm 10$  nm) parts of the spectrum on the basis of thin (up to 2  $\mu\text{m}$ ) gelatine layers having good color contrast. 6 refs.

Zyat'kov, I.P.; Zubareva, M.M.; Matveitseva, M.S.; Sagaidak, D.I.; Semenova, V.A. *J Appl Spectrosc* v 46 n 5 May 1987 p 477-479.

**075306 PHOTOCURRENT SPECTRA OF PHTHALOCYANINE FILMS IN RELATION TO EXCITED STATE PROPERTIES.** Photocurrent spectra of thin-film sandwich cells for vacuum-deposited phthalocyanines (Pc's) have been investigated and compared with their optical absorption spectra. A close resemblance was found between the two spectra for H<sub>2</sub>Pc and ZnPc, but peaks in the photocurrent spectra of CuPc and NiPc have been found to be considerably shifted compared with those in the absorption spectra. These photocurrent peaks in CuPc and NiPc correspond well to structures in the recently reported electroabsorption spectra of phthalocyanines. Direct charge-transfer excitation is suggested to play a role in the photocurrent generation in phthalocyanine films. The absorption spectrum of VOPc is considerably dependent on the deposition conditions of thin films, unlike other planar phthalocyanines. (Author abstract) 14 refs.

Minami, Nobutsugu (Research Inst for Polymers & Textiles, Tsukuba, Jpn); Asai, Michihiko. *Jpn J Appl Phys Part 1* v 26 n 10 Oct 1987 p 1754-1758.

**075307 INFRARED SPECTROSCOPY OF THIN ORGANIC FILMS ON METAL SURFACES.** The principles of external reflection infrared spectroscopy for obtaining spectra of thin films on surfaces by reflecting infrared radiation from the surface at large, almost grazing angles, are reviewed and new applications are described. Infrared spectra of monomolecular films formed by myristic acid adsorbed from dilute solutions in nitrobenzene onto aluminum and chromium were obtained. Adsorption onto both substrates involved dissociation of the acid groups to form carboxylate species, but undissociated monomer was retained in the films formed on aluminum. Myristic acid was adsorbed onto aluminum with a vertical conformation in which the twofold symmetry axes of the carboxylate groups were nearly perpendicular to the surface of the substrate. The twofold axes of the carboxylate groups were more inclined with respect to the normal to the surface for the chromium substrates. Terephthalic acid and terephthalic acid-*d*<sub>4</sub> were adsorbed onto aluminum from dilute solutions in ethanol with a vertical conformation in which one acid group was dissociated to form a salt with a metal ion in the substrate, while the other acid group may have formed hydrogen bonds with neighboring molecules. (Edited author abstract) 16 refs.

Boerio, F.J. (Univ of Cincinnati, Cincinnati, OH, USA); Boerio, J.P.; Bozian, R.C. *Appl Surf Sci* (1985) v 31 n 1 Jan 1988 p 42-58.

**075308 IR STUDIES OF PYROELECTRIC LANGMUIR-BLODGETT FILMS.** Alternate-layer

Langmuir-Blodgett (LB) assemblies, consisting of 22-tricosenoic acid with three different amine derivatives, have been fabricated. The pyroelectric activity in the films has been assessed and correlated with their structures determined using Fourier transform IR (FTIR) spectroscopy. Two of the acid/amine systems are pyroelectric but differ in that one exhibits proton transfer from the acid to the amine whilst the other retains discrete acid and amine units. For one of these systems, a pyroelectric coefficient of  $1.9$  nC  $\text{cm}^{-2}\text{K}^{-1}$  has been attained, representing the largest reported value, to date, for an LB film. The third type of film is not pyroelectric, and FTIR spectroscopy studies have revealed that this is due to a rearrangement of the molecules to produce a centrosymmetric structure in which pyroelectricity is precluded. (Author abstract) 13 refs.

Jones, C.A. (Univ of Durham, Durham, Engl); Petty, M.C.; Roberts, G.G.; Davies, G.; Yarwood, J.; Ratcliffe, N.M.; Barton, J.W. *Thin Solid Films* v 155 n 2 Dec 30 1987 p 187-195.

**075309 X-RAY DIFFRACTION AND OPTICAL STUDIES OF LANGMUIR-BLODGETT FILMS FORMED FROM AZOBENZENE DERIVATIVES.** X-ray diffraction data were used to construct the electron density profiles of Langmuir-Blodgett films formed from two azobenzene derivatives, before and after annealing at moderate temperatures. The annealing process caused phase changes to occur that were apparent in the changes in optically observed textures and X-ray diffraction patterns. Considerations of these changes led us to conclude that, before annealing, the Langmuir-Blodgett films possessed smectic liquid crystal A phases and, after annealing, one compound had a tilted, layered crystal phase and the other a tilted liquid crystal phase. (Author abstract) 8 refs.

**075310 DRAWING FINE PATTERNS ON N-OCTADECYLACRYLAMIDE LANGMUIR-BLODGETT MULTILAYERS: A NEW CLASS OF ULTRATHIN RESISTS.** Recently the authors found that the N-octadecylacrylamide (ODA) monomer forms a stable condensed monolayer and that the multilayers deposited onto solid supports were polymerized completely by UV irradiation. The polymerized ODA LB film is a uniform thin film having a high stability against solvents. Fine negative resist patterns due to the polymerized LB film could be drawn. This letter describes preliminary results on the application of the LB film to a deep UV-sensitive negative resist. 8 refs.

**075311 CHARACTERIZATION OF ASYMMETRICAL MOLECULAR ORIENTATION IN LANGMUIR-BLODGETT FILMS BY THE STARK EFFECT.** Three types of Langmuir-Blodgett film of an azobenzene derivative were prepared by hetero Y-type, Y-type and Z-type deposition methods. The molecular orientations in the films were determined from the analysis of the linear Stark effect (electroabsorption) spectra. Molecules in the hetero Y-type film were proved to align asymmetrically. However, molecular orientations in the Z-type films showed very small asymmetry. Investigation of the long spacing determined from x-ray diffraction supported the conclusion from the Stark effect. (Author abstract) 6 refs.

**075312 NEW EVALUATION METHOD OF EVAPORATED ORGANIC THIN FILMS BY ENERGY DISPERSIVE X-RAY DIFFRACTOMETER.** A new method was developed to obtain clear diffraction patterns of organic thin films evaporated on substrates such as Au. In this method, total reflection on substrates was utilized to most efficiently collect the diffracted x-rays from organic thin films. The x-rays were detected with a pure Ge solid-state detector set at a constant scattering angle and analyzed with a multichannel analyzer. Excellent performance of this system was demonstrated for a thin stearic acid film evaporated on Au and Cu-phthalocyanine on glass. (Author abstract) 4 refs.

**075313 NEW LANGMUIR-BLODGETT FILMS BUILT UP FROM A COPPER HALOGENIDE SEMI-AMPHIPHILIC SALT.** The aim of the present work is to show the feasibility of true LB films built up from a semi-amphiphilic salt in which the anion is a paramagnetic transition metal halogenide. For this purpose, we have chosen bis(octadecylammonium)/tetrachlorocuprate,  $(C_{18}H_{37}NH_3)_2CuCl_4$ . This salt was prepared by mixing a hot solution of copper chloride in ethanol with a boiling solution of the corresponding ammonium chloride also in ethanol. Perovskite-type yellow crystals were obtained by cooling the solution to room temperature. 15 refs.

**075314 CHEMICAL DEGRADATION OF GAS-SENSING MESO-TETRA-ARYLPORPHIN THIN FILMS BY HIGH LEVELS OF DINITROGEN TETROXIDE.** Thin solid films of free base meso-tetra-arylporphins and their zinc, copper, platinum and palladium complexes have been exposed to high levels of dinitrogen tetroxide (NOX). The optical spectra (300-850 nm) were recorded in transmission before and after exposure to NOX. On the basis of the foregoing spectroscopic evidence, films resistant to permanent chemical damage by high levels of NOX (>10,000 ppm) are identified. Reaction schemes are presented for those molecules that can be regenerated after chemical attack by NOX. The relevance of these observations to the selection of solid organic films suitable as industrial gas sensors is highlighted. (Author abstract) 24 refs.

**075315 ORIENTATION-CONTROLLED IMMOBILIZATION OF PROTEIN MOLECULES ON THIN ORGANIC FILMS DEPOSITED BY THE PLASMA TECHNIQUE.** The technique for the fabrication of protein-immobilized organic films was studied. A thin organic film 100 nm thick was deposited on the surface of substrates by the plasma polymerization technique, then the surface of the film was treated with a glow discharge in  $NH_3$  gas. Surface characterization by x-ray photoelectron spectroscopy was performed. The results indicated that a thin organic film with amino groups on its surface was formed on the substrates. Rabbit anti-human serum albumin IgG was immobilized on the surface of the film. The Fab'-SH domains were separated from the protein molecules and purified. The sulfhydryl groups of the molecules and the amino groups on the surface of the film were cross-linked by a bifunctional reagent. Using this method, binding sites of the molecules with the supporting material can be uniquely specified. The density of the immobilized protein molecule was estimated from the enzyme immunoassay measurement, and the results suggested that a high immobilization density (approximation  $6 \times 10^{11} \text{ cm}^{-2}$ ) could be achieved by this method. (Author abstract) 15 refs.

**075316 SYNTHESIS OF ELECTRICALLY CONDUCTIVE ORGANIC THIN FILM BY PLASMA POLYMERIZATION OF 3,4,9,10-PERYLENETET-RACARBOXYLIC DIANHYDRIDE.** The first synthesis of electrically conductive organic thin film by plasma polymerization (glow-discharge chemical vapor deposition) is reported. The monomer specifically employed is 3,4,9,10-perylenetetracarboxylic dianhydride consisting of five-condensed aromatic rings attached by carboxylic groups outside the rings. The film is air-stable and hard enough not to be scratched out. Electrical conductivity of the samples measured is more than  $1.0 \times 10^5 \text{ cm}^{-1}$  with n-type carriers at room temperature. Preliminary spectroscopic data are also to be shown. (Author abstract). 7 Refs.

**075317 HALL EFFECT IN CONDUCTING LANGMUIR-BLODGETT FILMS OF A TERNARY TETRACYANOQUINO-DIMETHANE SALT.** In the present work, the first successful Hall effect measurements in these conducting LB films are reported. These measurements appear as a strong argument in favor of a semiconductor band model rather than a hopping model. The key point in measuring the Hall effect is to design a suitable sample shape and to use an operating procedure, which makes it possible to keep the two Hall probes at the same potential before applying a magnetic field. The substrates are optically polished glass slides. In order to improve the transfer rate, substrates are systematically precoated with a few LB layers of the classical dipping-withdrawing method and the films are exposed to iodine vapor. This iodination process results in stable, homogeneous, conducting films. 20 Refs.

**075318 EXPERIMENTAL CRITERIA FOR MONOLAYER STUDIES IN RELATION TO THE FORMATION OF LANGMUIR-BLODGETT MULTILAYERS.** Langmuir-Blodgett (LB) multilayers are formed by the dynamic transfer of molecules to a solid support from a preformed monolayer, usually at the air-water interface. Control of this process depends in part on knowing the properties of the air-water monolayer. These properties are discussed in terms of the variables defining equilibrium reference states and of the several rate processes which govern the transport and transfer of the monolayer substance to the solid support. The need for agreed reference states and new rheological studies to support further advances in LB technology is evident. (Author abstract) 17 refs.

**075319 EXPERIMENTAL CONSIDERATIONS IN INSOLUBLE SPREAD MONOLAYERS.** When lipid multilayers are prepared by the Langmuir-Blodgett method their quality depends on the deposition process and the condition of an insoluble monolayer spread at the air-water interface. It is shown how trace impurities can drastically alter the properties of this monolayer. Several sources of impurities are identified and methods of reducing their level are reviewed. Attention is focused on water purification and the preparation of surface chemically pure, virtually ion-free water is described. Methods for the elimination of particles and at the same time maintaining this standard do not seem to be established. A major error in surface pressure vs. area isotherms arises from monolayer losses on spreading which can be substantial and the checks described for quantitative spreading are advocated. The two main methods of measuring surface pressure are assessed and possible sources of error are explored. (Author abstract) 34 refs.

Mingins, J. (Norwich Lab, Norwich, Engl); Owens, N.F. *Thin Solid Films* v 152 n 1-2 Sep 14 1987, Workshop on the Mol Eng of Ultrathin Polym, Davis, CA, USA, Feb 18-20 1987 p 9-28.

**075320 PRE-LANGMUIR-BLODGETT MONOLAYERS.** We focus on simulation techniques that use brownian dynamic algorithms. It is possible to define molecular interactions well enough to yield detailed pictures of monolayer states along the entire isotherm. While providing difficulties for the simulation, phase transitions can be observed. Useful thermodynamic quantities can be estimated including the surface pressure tensor, elastic moduli and various distribution functions. We show the evolution of a simulation from the initial state (perfect crystal) to the equilibrium state for  $\pi = 37.5 \text{ mN m}^{-1}$ . A systematic tilt is observed for the molecules in the equilibrium state. Aggregation is observed in simulations of more expanded films. New X-ray diffraction methods for determining monolayer structure are summarized. Experimental methods for determining viscoelastic moduli using capillary waves are summarized. We discuss the integration of these methodologies in developing an understanding of Langmuir-Blodgett deposition. (Edited author abstract) 30 refs.

**075321 PHYSICAL PROPERTIES OF ORDERED ULTRATHIN ORGANIC FILMS.** This review is a presentation of the state of the art and research needs required for the study of the physical properties of ordered ultrathin organic films. For many properties of ultrathin films the topic of electronic transport is central. Drawing on the conclusion of a previous review of non-linear transport in organic materials, the present review is placed within the context of attempting to understand the physical mechanisms underlying ultrathin organic films, and a physical model is provided with this view in mind. The topics addressed are (a) general aspects of electrical conductivity, (b) the optical properties of organic thin films, (c) the physics of macroscopic or collective phenomena, (d) the physics of critical phenomena, (e) band gap engineering, and (f) capillarity and wetting. (Edited author abstract) 171 refs.

**075322 STRUCTURE OF LANGMUIR-BLODGETT FILMS.** In a series of experiments involving IR spectroscopy, Raman spectroscopy, scanning tunneling microscopy and measurements of the near-edge X-ray fine structure, many new details of the structure of Langmuir-Blodgett films have been obtained. The methods and the results giving orientation of the chains, their packing and the head group attachment are described, as well as other properties such as phase transitions. (Author abstract) 31 refs.

**075323 DEFECT CHARACTERIZATION AND DETECTION IN LANGMUIR-BLODGETT FILMS.** The Langmuir-Blodgett technique enables the production of ultrathin organic films. These layers are known for their high quality and well-organized structure. However, defects are present in them. In the present paper a review is given of the different types of defects together with their electrical characterization and their visualization by optical or electron microscopy. Several examples of decoration

techniques and the importance of the defects for various applications are also presented. (Author abstract) 37 refs.

**075324 CHARACTERIZATION OF THE STRUCTURE OF LANGMUIR-BLODGETT FILMS BY SHORT-WAVELENGTH RADIATIONS.** A review is given of the methods of determining the structure of organic thin films using short-wavelength radiations. These include X-rays, electrons and neutrons. Most of the methods involve diffraction and interference effects, of either traveling or standing waves. In addition, direct imaging techniques are also mentioned. Particular emphasis is given to the structure of Langmuir-Blodgett films but the applicability extends to thin polymer films as well. Some trends of the research in this field are identified. (Author abstract) 54 refs.

**075325 ORGANIC FILMS IN NON-LINEAR INTEGRATED OPTICS STRUCTURES.** Organic films with specifically engineered optical properties hold considerable promise for applications in integrated optics. Light can be propagated for up to centimeter distances in waveguides to interact with organic films of thicknesses 1-5000 nm which are either deposited onto the waveguide or form the guiding medium, depending on the application. The potential advantage of using organic materials is that the molecules can be optimized for their optical response, e.g. second- and/or third-order optical non-linearities for efficient modulation, harmonic generation, all-optical signal processing etc. The basic concepts of integrated optics, non-linear guided wave interactions, material requirements for various applications and progress to date are reviewed. (Author abstract) 106 refs.

**075326 LANGMUIR-BLODGETT FILMS AND NON-LINEAR OPTICS.** Recent work on the non-linear optical and electro-optical properties of Langmuir-Blodgett monolayers and multilayers is reviewed. The fundamental theory of non-linear optical susceptibilities and interactions is discussed, as well as their relationship to molecular hyperpolarizabilities. Among the non-linear optical experiments discussed are second and third harmonic generation, d.c. electric field induced second harmonic generation and the Pockels linear electro-optic effect. It is shown that surface second harmonic generation is a powerful tool for studying the orientation of molecules and their hyperpolarizabilities. The interactions between monolayers and metallic surfaces are also studied by surface-plasmon-enhanced second harmonic generation. Finally, third harmonic generation is used to study the electronic spectra and resonances (two- and three-photon absorption) on very thin multilayers of polydiacetylenes. It is concluded that non-linear optics is a powerful and useful tool for the study of Langmuir-Blodgett films, and that there is a good understanding of fundamental theoretical and experimental problems. (Edited author abstract) 44 refs.

**075327 NON-LINEAR OPTICAL EFFECTS IN THIN ORGANIC POLYMERIC FILMS.** In this paper a comprehensive account is presented of research work carried out in the author's laboratory in the areas of design of polymeric thin films, investigation of their ultrastruc-

ture and studies of non-linear optical effects. Thin film design and fabrication involve two approaches: electrochemical polymerization and the Langmuir-Blodgett technique. Application of laser Raman optical wave-guides, inelastic electron tunneling, picosecond transient gratings and surface plasmon coupling techniques for the study of ultrastructure is discussed. Results are presented from picosecond and subpicosecond degenerate four-wave mixing, time-resolved coherent Raman spectroscopy, surface plasmon non-linear optics and optical bistability behavior at a non-linear interface to elucidate the nature of third-order non-linear optical effects in thin films of  $\pi$  electron conjugated polymeric systems. (Author abstract) 29 refs.

**075328 THIN ORGANIC FILMS OF PROTEINS.** Biological applications of protein films, machines and devices are briefly reviewed. A brief discussion of protein structure and properties is given. Needs and opportunities in the field include the following: (a) better potential functions to model and predict protein structure, denaturation and adsorption and the assembly of protein films and devices; (b) better methods to characterize protein films, particularly two-dimensional structures and ordering; (c) better means to assemble and stabilize protein machines, such as in lipid or polymer films; (d) means to modify protein stability, binding and enzymatic properties. About 5000 different proteins exist, each 'designed' for a specific function: they can serve to stimulate and aid scientists and engineers in the design and development of new generations of molecular machines and devices. **075329 EFFECTS OF SODIUM PENTACHLOROPHENATE ON THE ECOLOGY OF A FRESHWATER MODEL ECOSYSTEM.** An outdoor model ecosystem was designed for the ecotoxicological evaluation of xenobiotics. Two years were necessary before the artificial pond reached a steady state. During this time the composition of the community and its functions were investigated. A short time before the application of sodium pentachlorophenate (Na-PCP) the ecosystem was divided into three identical subunits. One of these was used as an internal control, the others were contaminated with two different concentrations of Na-PCP (0.1 and 0.3 mg litre<sup>-1</sup>). One year after application of the chemical, the remineralization of nutrients was disturbed. This resulted in a diminution of the phytoplankton and the aquatic fauna. (Edited author abstract) 28 refs.

**075331 POLYCHLORINATED BIPHENYLS AND POLYCHLORINATED DIBENZOFURANS IN THE TISSUES OF PATIENTS WITH YUSHO OR YU-CHEN; TOTAL TOXICITY.** The most serious incident of polychlorinated biphenyls (PCBs) and polychlorinated dibenzofurans (PCDFs) poisoning in humans, referred to as Yusho, occurred in Western Japan in 1968 and involved the ingestion of rice oil contaminated with these compounds. A second similar mass food poisoning, Yu-Chen, took place in central Taiwan in 1979. It is presently impossible to assess, directly from high resolution capillary gas chromatographic (GC) data, the total toxicity resulting from a mixture of these toxic substances in a particular tissue. It is the objective of this study to provide a method for determining the relative toxicity of each of these congeners and isomers in terms of an equivalent toxic concentration of TCDD so that the overall toxicity of the mixture may be evaluated. The applicability of this approach is then demonstrated by the direct conversion of available Yusho and Yu-Chen GC data to total equivalent toxicities of TCDD. 21 refs.

**075333 DERIVATIZATION AS AN APPROACH TO TRACE ANALYSIS BY GAS CHROMATOGRAPHY WITH ELECTRON-CAPTURE DETECTION.** The unsurpassed sensitivity and selectivity of the electron-capture detector to compounds of environmental and biomedical importance has maintained widespread interest in its application to all aspects of organic trace analysis. In this review, the characteristics of the reagents used for trace analysis are discussed. The subject is treated in general terms to provide an overview of the techniques involved, present some considerations for reagent selection, and discuss those aspects of the detector's response that influence the quality of quantitative data measured at trace levels. (Edited author abstract) 83 refs.

Poole, Colin F. (Wayne State Univ, Detroit, MI, USA); Poole, Salwa K. *J Chromatogr Sci* v 25 n 10 Oct 1987 p 434-443.

**075334 TRACE ANALYSIS OF VOLATILE POLAR ORGANICS: PROBLEMS AND PROSPECTS.** Existing approaches to the trace analysis of volatile polar organics by gas chromatography are reviewed. Problems are noted, and the prospects for solving these problems and developing protocols that are suitable for routine use are discussed. It is shown that one of the more promising techniques for the further development of trace analysis of volatile polar organics employs an uncoated capillary column to concentrate analytes from water. The organics are removed from aqueous solution merely by passing the

sample through an uncoated capillary. They are subsequently desorbed thermally or by the use of an appropriate solvent. 38 refs.

**075335 SAMPLING AND ANALYSIS TECHNIQUES FOR TRACE VOLATILE ORGANIC EMISSIONS FROM CONSUMER PRODUCTS.** Comparisons are made of two techniques for the trace analysis of volatile organic compound (VOC) emissions from consumer products: direct on-line sampling and analysis and on-line solid sorbent collection followed by off-line analysis. Two types of direct analyses are examined. The first consists of direct injection of emissions from a sample loaded environmental chamber into a gas chromatograph equipped with a flame ionization detector (FID) for compound identification. Direct injection of headspace collected emissions into a gas chromatograph equipped with a mass selective detector is the second direct method scrutinized. The more traditional technique of solid sorbent collection of the volatile organic emissions followed by thermal desorption (TD)/gas chromatographic (GC)/mass spectrometric desorption analysis is compared to both direct on-line methods. (Author abstract) 14 refs.

## Viscoelasticity

**075336 INFLUENCE OF ADDED SALT ON DYNAMIC VISCOELASTICITY OF CARBOXYMETHYLCELLULOSE AQUEOUS SYSTEMS.** Using three series of sodium carboxymethylcellulose (NaCMC) in the range of the degree of substitution (the average number of carboxymethyl groups/glucose unit) from 0.5 to 1.3, weight-average molecular weight  $M_w$  was determined by light scattering in solution of triethylenediamine cadmium hydroxide (cadoxene). It was found that the relation between  $M_w$  and the limiting viscosity number  $[\eta]$  in 0.1 N sodium chloride (NaCl) aqueous solution can be represented by Staudinger's equation. Dynamic viscoelasticity of aqueous disperse systems of NaCMC with various added salts was measured by means of a cone-and-plate rheometer. If the concentration of added salt is less than the concentration at which polymer begins to salt out, frequency dependence curves of the dynamic modulus, which is measured at various salt concentrations, can be superposed into a master curve by horizontal shift only. (Edited author abstract) 12 refs.

**Viscosity** See Also OIL WELL PRODUCTION—Tertiary; POLYSACCHARIDES—Viscosity.

**075337 DENSITIES AND VISCOSITIES OF THE BINARY MIXTURES METHANOL-ETHYLBENZENE AND CUMENE-1-BUTANOL.** Densities and viscosities of two binaries, viz., methanol-ethylbenzene, and cumene-1-butanol, were measured at 25 and 35°C. The excess values of molar volume, viscosity and Gibbs free energy for the activation of flow were evaluated. The Grunberg-Nissan parameter was calculated. The viscosity data were fitted to the semitheoretical equations of R.L. McAllister, E.L. Heric and a polynomial. The results indicate the presence of molecular interactions between unlike molecules in both the binaries with the strength of interaction being greater in methanol-ethylbenzene. (Author abstract) 16 refs.

Rattan, V.K. (Panjab Univ, Chandigarh, India); Singh, Sukhmehar; Sethi, B.P.S.; Raju, K.S.N. *Indian J Technol* v 25 n 6 Jun 1987 p 253-258.

**075338 VISCOSITIES OF BINARY MIXTURES OF CYCLOPENTANE AND n-ALKANES AT 298.15 K.** Viscosities of binary mixtures of cyclopentane +

n-hexane, + n-octane, + n-decane, + n-dodecane, + n-tetradecane and + n-hexadecane have been measured at 298.15 K. The excess viscosity and the excess Gibbs energy of activation of viscous flow have been calculated from the experimental data. The predicted excess viscosity from the absolute rate and free volume theories of viscosities is in poor agreement with the experimental. The differences may be attributed to the orientational order effect in the long chain n-alkanes. (Author abstract) 17 refs.

Awad, Alk M. (Council of Scientific Research, Baghdad, Iraq); Salman, Muna A. *J Pet Res* v 6 n 2 Dec 1987 p 117-129.

**075339 ISOBARIC VAPOUR-LIQUID EQUILIBRIA AND VISCOSITIES OF (1, 2-DICHLOROETHANE + METHYLCYCLOHEXANE).** Isobaric vapor liquid equilibria for the mixtures of 1,2-dichloroethylene and methylcyclohexane measured using a vapor recirculating equilibrium still at 100.5 kPa are reported. The system is found to form a minimum boiling azeotrope. Wilson equation gave the best fit of the experimental activity coefficients, whose thermodynamic consistency have been tested by the methods of E.F.G. Herrington, C. Black, R. Norrish and G.H. Twigg, and B.C.-Y. Lu. Viscosities at 308.15 K have been measured using a modified Ubbelohde viscometer. The excess viscosity, excess molar Gibbs free energy for the activation of flow, and Grunberg and Nissan parameter derived from the mixture viscosity data are also presented. The study indicates dipole-induced dipole type interactions in the system. This data is essential for the design of equipment for separation processes. (Edited author abstract). 35 Refs.

**075340 TRANSFORMATION OF OXO RHENIUM COMPLEXES USED AS CATALYSTS IN METATHESIS REACTION.** For a better understanding of the role of oxo complexes in olefin metathesis reaction, we examined the following Re(III) compounds:  $\text{ReCl}_3(\text{PMePh}_2)_3$ ,  $\text{ReCl}_3[\text{P}(\text{OEt})_3]_3$ ,  $\text{ReCl}_3\text{py}_3$  and related Re(V) oxo complexes:  $\text{ReOCl}_3(\text{PPh}_3)_2$ ,  $\text{ReOCl}_3[\text{P}(\text{OEt})_3]_2$  and  $\text{ReOCl}_3\text{py}_2$  as precatalysts in metathesis reaction. It was found that the formation of ethane was shown by means of  $^1\text{H}$  NMR for solution and by mass spectroscopy for vapour phase samples taken from over a solution. One of the most significant changes in the  $^1\text{H}$  NMR spectrum was the appearance of a broadened quartet at  $\delta$  6.70 ppm most likely due to alkylidene  $\alpha$ -proton. Moreover, complicated changes in the methylene and methyl group resonating regions were observed. 16 refs.

**075341 ZUR CHEMISCHEN BINDUNG IN DER ERSTEN ORGANOMETALLCLUSTERVERBINDUNG MIT EINEM INTERSTITIELLEN SI-ATOM**

**IM CLUSTERANION  $[\mu_8\text{-SiCo}_9(\text{CO})_{21}]^{2-}$ .** [Chemical Bonding in the First Organometallic Cluster Compound with an Interstitial Si-Atom in the Cluster Anion  $[\mu_8\text{-SiCo}_9(\text{CO})_{21}]^{2-}$ ]. The aim of this work is to calculate the electronic structure of the cluster anion  $[\mu_8\text{-SiCo}_9(\text{CO})_{21}]^{2-}$  using a combination of EHMO and SW-X $\alpha$ -methods. Energies and correlation diagrams (including geometry optimization), as well as charge distribution (population analysis) and bonding properties, are discussed in detail. (Edited author abstract) In German. 23 refs.

Mueller, H. (Friedrich-Schiller-Univ, Jena, East Ger); Fuehr, U.; Opitz, Ch.; Fritsche, H.-G. *J Less Common Met* v 137 Feb 1 1988 p 195-210.

**075342 CHIRAL SYNTHESIS VIA ORGANOBORANES. 13. A HIGHLY DIASTERESELECTIVE AND ENANTIOSELECTIVE ADDITION OF  $[(Z)\text{-}\gamma\text{-ALKOXYALLYL}]\text{DIISOPINOCAMPHEYLBORANES TO ALDEHYDES}$ .** Isomerically pure  $[(Z)\text{-}\gamma\text{-methoxyallyl}]\text{diisopinocampheylboranes}$  have been prepared from 8-methoxydiisopinocampheylborane and lithiated allyl methyl ether. These enantiomeric  $[(Z)\text{-}\gamma\text{-methoxyallyl}]\text{diisopinocampheylboranes}$ , the first such derivatives to be synthesized, retain their stereochemical identity under the reaction conditions. They have been successfully condensed with various aldehydes, such as acetaldehyde, propionaldehyde, 2-methylpropionaldehyde, and benzaldehyde in a regioselective and stereoselective manner to yield the corresponding three- $\beta$ -methoxyhomoallyl alcohols in  $\geq 99\%$  diastereoselectivities and  $\geq 95\%$  enantioselectivities. This work is of interest to the synthesis of carbohydrates and antibiotics. (Edited author abstract) 22 refs.

Brown, Herbert C. (Purdue Univ, West Lafayette, IN, USA); Jadhav, Prabhakar K.; Bhat, Krishna S. *J Am Chem Soc* v 110 n 5 Mar 1988 p 1535-1538.

**075343 EFFECT OF CAVITY SIZE ON THE CHARGE DISTRIBUTION IN CARBIDO-METAL CARBONYL CLUSTERS AND ITS POSSIBLE CATALYTIC IMPLICATIONS.** Molecular orbital calculations on carbido-transition-metal carbonyl cluster compounds where the carbon atom lies in a large cavity indicate a substantial buildup of negative charge on the carbon atom. Besides making the carbon more susceptible to protonic attack the large cavity assists the stabilization of interstitial C-H fragments. Experimental evidence suggests that a carbon atom within a large cavity bears a substantial negative charge and should be very susceptible to electrophilic reagents. The results of the molecular orbital calculations on model carbido clusters with 4-12 metal atoms are summarized. (Edited author abstract) 18 refs.

Halet, Jean-Francois (Univ of Oxford, Oxford, Engl); Evans, David G.; Michael, D.; Mingos, P. *J Am Chem Soc* v 110 n 1 Jan 6 1988 p 87-90.

**075344 CARBON-METAL HYDROGEN INTERCHANGE IN ORGANOMETAL CLUSTERS ON RUTHENIUM AND OSMIUM.** Facile carbon-metal hydrogen exchange is demonstrated by the scrambling of deuterium into the hydrocarbon ligand at 110°C in a sample initially 80% enriched in deuterium at the hydride position by  $^1\text{H}$ -NMR techniques. Deuterium was incorporated into the allenic hydrogen position and the methylene hydrogens but not into the methyl groups. These studies demonstrate that reversible carbon-metal hydrogen interchange at  $\alpha\text{-C-H}$  bonds can be a facile process in trinuclear organometallic complexes of ruthenium and osmium containing  $\eta^3\text{-hydrocarbon}$  ligands. (Edited author abstract) 12 refs.

Skinner, David M. (California State Univ, Northridge, CA, USA); Rosenberg, Edward; Bracker-Novak, Julia; Aime, Silvio; Osella, Domenico; Gobetto, Roberto. *Organometallics* v 7 n 4 Apr 1988 p 856-858.

**075345 ORGANOMETALLIC COMPLEXES OF OSMIUM WITH SULFUR-CONTAINING LIGANDS: SYNTHESIS OF**  $\text{cis}[\text{Os}(\text{N}(\text{CH}_2\text{SiMe}_3)_2)(\text{SCH}_2\text{CH}_2\text{S})^-]$  **AND**  $\text{cis}[\text{Os}(\text{N}(\text{CH}_2\text{SiMe}_3)_2)(\text{SCN})_2]^-$  **AND THE SYNTHESIS AND X-RAY CRYSTAL STRUCTURE OF**  $\text{cis}[\text{Os}(\text{N}(\text{CH}_2\text{SiMe}_3)_2)(2\text{-S-NC}_5\text{H}_4)_2]$ . Osmium (VI) complexes with 1,2-ethanedithiolato, pyridine-2-thiolato, and thiocyanato ligands can be prepared in good yield by substitution of halide in the dihalide complex  $[\text{N-n-Bu}_4][\text{Os}(\text{N}(\text{CH}_2\text{SiMe}_3)_2)_2]$ . These complexes are thermally stable and stable to air and water. Analysis of IR spectra shows that in the major isomer of  $[\text{N-n-Bu}_4][\text{Os}(\text{N}(\text{CH}_2\text{SiMe}_3)_2)(\text{SCN})_2]$  both thiocyanate groups are bonded to osmium through nitrogen, while the minor isomer contains both S-bonded and N-bonded thiocyanate groups. The 1,2-ethanedithiolato and pyridine-2-thiolato ligands are strongly electron-donating to the osmium center. 24 refs.

**075346 NEW FERROCENYL SULFIDES AND SELENIDES: PREPARATION AND APPLICATION AS EFFICIENT SELECTIVE HYDROGENATION CATALYSTS.** In this work we report the preparation of new ferrocenyl sulfide and selenide complexes such as  $\text{C}_5\text{H}_5\text{Fe}(\text{C}_5\text{H}_4\text{-1-CH}_2\text{NMe}_2\text{-ER})\text{PdCl}_2$  ( $\text{E}=\text{S}, \text{Se}; \text{R}=\text{Pr}, \text{n-Bu}, \text{s-Bu}, \text{t-Bu}, \text{Bz}, 4\text{-tolyl}, 4\text{-ClPh}$ ). These chiral complexes have been used in selective hydrogenation of conjugated dienes to monoenes at ambient temperatures.  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectra were obtained, and IR, MS, melting point, and elemental analysis data of these bimetallic complexes are presented. The palladium(II) ferrocenyl sulfide complexes are good selective homogeneous and heterogeneous hydrogenation catalysts for the reduction of conjugated dienes to monoenes at room temperature. (Edited author abstract) 59 refs.

**075348 THEORY OF JAHN-TELLER INTERACTION IN METALLOCEENES: I. COBALTOCENE AND FERRICENIUM CATION.** A canonical transformation and variational approach is used to treat the Jahn-Teller problem in an effective one-electron or hole case in  $D_{5h}$  symmetry. The Jahn-Teller spin-orbit and orthorhombic field interactions are treated on equal footing. The variational wavefunctions are used to calculate the magnetic and EPR behavior of cobaltocene and ferricenium cation. In cobaltocene the orthorhombic interaction is found to be small and whether it is treated on equal footing with the other two interactions or as a perturbation the values of the variational parameters remain nearly the same. In ferricenium cation the covalency effects are found to be negligible. Along with the linear (JT) term the third order term in the vibrational potential also plays an important role in this case. (Author abstract) 10 refs.

Rai, R. (Natl Physical Lab, New Delhi, India). *Physica B & C* v 150 n 3 Jun 1988 p 414-418.

**075349 THEORY OF JAHN-TELLER INTERACTION IN METALLOCEENES: II. CHROMOCENE.** The  $^3E_g(e^3_2g^1_1g)$  ground state of chromocene is treated

as a system consisting of two holes, one in the  $e_{2g}$  and the other in the  $a_{1g}$  orbital. By a suitable choice of the basis vectors the vibronic eigenvalue equations of this case are transformed into isomorphic forms to the corresponding equation for the one electron case. The method of canonical transformation and variational approach developed in part I therefore is applied to chromocene also. The variational wavefunctions and energies are used to explain the EPR and Raman spectroscopy results on the complex. (Author abstract) 7 refs.

Rai, R. (Natl Physics Lab, New Delhi, India). *Physica B & C* v 150 n 3 Jun 1988 p 419-422.

**075350 FIFTH INTERNATIONAL CONFERENCE ON THE ORGANOMETALLIC AND COORDINATION CHEMISTRY OF GERMANIUM, TIN AND LEAD.** This issue contains 12 conference papers, of which 2 are given in abstract form only. All of the papers are abstracted and indexed separately. Topics covered include: organotin compounds; organic synthesis; amorphous semiconducting germanium; coordination compounds; electronic stabilized stannyls; stereoselective synthesis; hydrogen bonding; and organogermanium compounds. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 10224 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

**075351 STUDIES OF REACTIONS BETWEEN GASEOUS ORGANO-SILICON COMPOUNDS AND METAL SURFACES.** A procedure for modifying the surface composition of catalytically active metals with silicon-containing gaseous reactants has been developed. This new gas-solid reaction method is unique in that it can be used for the in situ synthesis of catalytically interesting materials, which cannot be done by conventional solid-solid reaction techniques. This treatment can readily be accomplished in situ in the catalytic reactor. The above reactions may well result in a new class of metallic catalysts, with one of the components being silicon. Furthermore, gas-phase compounds containing the elements aluminum, boron, and germanium are known to react with metals in an analogous manner, which further extends the range of possibilities for the synthesis of new catalytic materials. **075352 SILICON COMPOUNDS WITH STRONG INTRAMOLECULAR STERIC INTERACTIONS: XXIII. FORMATION AND REACTIONS OF STERICALLY CONGESTED ACYCLIC TRISILANES AND OF A TETRASILOXANE.** Ring opening reactions of hexa-tert-butylcyclotrisilane with halogens ( $\text{Cl}_2$ ,  $\text{Br}_2$ ,  $\text{I}_2$ ) or with halides lead to sterically crowded 1,3-dihalo-hexa-tert-butyltrisilanes which are easily converted into the corresponding 1,3-dihydrotrisilane. Reaction of the dihalotrisilanes with methylolithium regenerates the cyclotrisilane in moderate yield. Irradiation of the three-membered cycle and dimethylsulfide in the presence of water affords 1,7-dihydro-1,1,3,3,5,5,7,7-octa-tert-butyl-tetrasiloxane. (Author abstract) 11 refs.

**075354 LASER DECOMPOSITION OF PLATINUM METALLO-ORGANIC FILMS FOR ELECTROLESS COPPER PLATING.** Micron-size platinum features are patterned by focusing the output of a CW argon ion laser (514.5 nm) onto a scanning quartz substrate coated with a spun-on platinum metallo-organic film. The platinum is used as a seed layer for electroless copper plating. The role of laser power, scan speed, and film thickness on the thermal decomposition of the film is discussed. In addition, the electrochemical activity and composition of the platinum features, as well as their use as seed layer for electroless copper plating, is reported. (Author abstract) 11 refs.

Sausa, Rosario C. (IBM, Yorktown Heights, NY, USA); Gupta, Arunava. *J Electrochem Soc* v 134 n 11 Nov 1987 p 2707-2713.

**075355 DECOMPOSITION OF  $\text{CH}_3\text{TiCl}_3$  COMPLEXES WITH PYRIDINE-BASED LIGANDS.** The kinetics and mechanisms of the reactions of  $\text{CH}_3\text{TiCl}_3$  with pyridine,  $\gamma$ -picoline, and 4-vinylpyridine were investigated. It was found that a homolytic break of the Ti-C bond takes place in  $\text{CH}_3\text{TiCl}_3$  complexes with pyridine. It was established that, as a consequence of the decomposition of the Ti-C bond in  $\text{CH}_3\text{TiCl}_3$  complexes with 4-vinylpyridine and with  $\gamma$ -picoline the pyridine ring is metallized. The rate constants of this process were determined. (Author abstract) 9 refs.

Doping

**075356 ELECTROCHEMICAL DOPING OF ( $\mu$ -PYRAZINE)-PHTHALO-CYANINATOIRON(II). G. alvanostatic doping of  $[\text{PcFe}(\text{pyz})_2]_n$  ( $\text{Pc}$ =phthalocyaninato,  $\text{pyz}$ =pyrazine) using several anions leads to well characterized compounds with the stoichiometry  $[\text{PcFe}(\text{pyz})_2X]_n$  ( $X=\text{BF}_4^-$ ,  $\text{PF}_6^-$ ,  $\text{ClO}_4^-$ ,  $\text{HSO}_4^-$ ,  $\text{SCN}^-$  and  $\text{BPh}_4^-$ ). The stoichiometry of the doped samples was established by elemental analyses, thermogravimetric analyses (TG/DTA) and charge quantity measurements. Magnetic measurements and  $^{57}\text{Fe}$  Mossbauer data show that the oxidation is mainly ligand centered. Four-probe conductivity measurements reveal**

increases in conductivity of up to four orders of magnitude. The increase in conductivity was accompanied with a broad electronic absorption in the infrared spectra.  $^{13}\text{C}$  CP-MAS solid-state n.m.r. spectra and X-ray powder diffraction data are also recorded. (Author abstract) 14 refs.

Hanack, Michael (Univ Tuebingen, Tuebingen, West Ger); Leverenz, Andreas. *Synth Met* v 22 n 1 Nov 1987 p 9-14.

## Electric Conductivity

**075357 STRUCTURAL AND ELECTRICAL PROPERTIES OF (BEDT-TTF) $_2\text{Hg}_3\text{Br}_{11}$ .** New organic conductors (BEDT-TTF) $_2\text{Hg}_3\text{Br}_{11}$  and (BEDT-TTF) $\text{HgBr}_3$  (BEDT-TTF: bis(ethylenedithio)tetrathiafulvalene) are prepared, and their crystal structures, transport properties, and ESR are investigated. In the former complex, 3/10 of the BEDT-TTF molecules are incorporated in the anion sheet as BEDT-TTF $^{2+}$ . This complex shows, in spite of its complicated 7-fold periodicity, metallic conductivity down to 120 K. (Author abstract) 10 refs.

Mori, T. (Inst for Molecular Science, Okazaki, Jpn); Wang, P.; Imaeda, K.; Enoki, T.; Inokuchi, H. *Solid State Commun* v 64 n 5 Nov 1987 p 733-737.

**075358 SUPERCONDUCTIVITY AT 10 K AND AMBIENT PRESSURE IN THE ORGANIC METAL (BEDT-TTF) $_2\text{Cu}(\text{SCN})_2$ .** The authors confirm the observation of superconductivity at ambient pressure above 10 K in the metal (BEDT-TTF) $_2\text{Cu}(\text{SCN})_2$  as reported recently by Urayama et al. The authors have measured ESR, ac-susceptibility and thermopower in crystals of (BEDT-TTF) $_2\text{Cu}(\text{SCN})_2$  and have shown that in contrast to other organic superconductors a relatively sharp superconducting transition even in the ac-susceptibility can be observed which saturates already around 8 K. The thermopower measurements indicate a clear metal-metal phase transition at 100 K and a possible second phase transition at around 50 K, while from the temperature dependence of the and susceptibility (ESR) these phase transitions cannot be observed. (Edited author abstract) 17 refs.

Gaertner, S. (Max Planck-Inst fuer Medizinische Forschung, Heidelberg, West Ger); Gogu, E.; Heinen, I.; Keller, H.J.; Klutz, T.; Schweitzer, D. *Solid State Commun* v 65 n 12 Mar 1988 p 1531-1534.

**075359 TEMPERATURE AND PRESSURE DEPENDENCE OF THE RESISTIVITY OF  $\beta(\text{BEDT-TTF})_2\text{X}(\text{X}=\text{I}_3, \text{I}_2, \text{Au})$  AND  $\alpha\text{T}(\text{BEDT-TTF})_2\text{I}_3$ .** The temperature dependence of the resistivity of the organic metals and superconductors  $\beta(\text{BEDT-TTF})_2\text{I}_3$ ,  $\beta(\text{BEDT-TTF})_2\text{I}_2$  and  $\alpha\text{T}(\text{BEDT-TTF})_2\text{I}_3$  was measured at ambient and at several isotropic pressures (up to 2.5 kbar). By the application of a relatively low pressure, it is possible to measure the term in the resistivity that is linear in temperature. This term is masked by the larger  $T^2$  term at ambient pressure. It is shown that in the temperature range below 120 K, the external modes are mainly responsible for the resistivity, while above this temperature the flipping of the  $\text{CH}_2$  groups becomes important. (Edited author abstract). 18 Refs.

Weger, M. (Hebrew Univ, Jerusalem, Isr); Bender, K.; Klutz, T.; Schweitzer, D.; Gross, F.; Heidmann, C.P.; Probst, CH.; Andres, K. *Synth Met* v 25 n 1 Jul 1988 p 49-58.

## Electric Properties

**075360 ELECTRICAL CONDUCTIVITY AND THERMOPOWER STUDIES ON  $\text{Fe}_x[\text{Pt}(\text{C}_2\text{O}_4)_2] \cdot 6\text{H}_2\text{O}$  (WHERE  $x=0.8$ ).** The electrical conductivity (dc and 35 GHz) and thermopower of  $\text{Fe}_x[\text{Pt}(\text{C}_2\text{O}_4)_2] \cdot 6\text{H}_2\text{O}$ , Fe-OP, are presented and compared with those of other partially oxidized bis(oxalato)platinate salts of divalent cations. At room temperature Fe-OP is metallic with a conductivity of  $6\text{ S cm}^{-1}$  and a thermopower of  $15\text{ } \mu\text{V/K}$ . Below room temperature there is a structural transition, which has little influence on transport proper-

ties. Below 160 K Fe-OP is a semiconductor with an activation energy of 55 meV. (Author abstract) 11 refs.

Kaye, B. (Univ Coll of North Wales, Gwynedd, Wales); Underhill, A.E.; Mortensen, K.; Carneiro, K.; Yuequiang, Shen; Jacobsen, C.S.; Bertinotti, A. *Synth Met* v 22 n 1 Nov 1987 p 35-40.

**075361 ELECTRIC AND MAGNETIC PROPERTIES OF ORGANOMETALLIC TCNQ SALTS.** Three salts  $[(\eta^5\text{-C}_5\text{H}_5)\text{FeAr}]^+[(\text{TCNQ})_2]^-$  ( $\text{Ar}=\text{2, 4, 6-C}_6\text{H}_3\text{Me}_3$ ,  $\text{C}_6\text{Me}_6$ ,  $\text{C}_6\text{Et}_6$ ) have been characterized by dc conductivity, thermoelectric power and esr measurements. Quasi-semiconducting properties of electric transport have been found, with a temperature-dependent energy gap in the case of the first two salts and a constant gap for the third salt. The magnetic properties have been shown to be determined by the non-paired electrons of TCNQ. The angular dependences of the g factor and the esr linewidth have been analyzed with regard to the crystal structure. The spin interactions and localization of electrons have been found to be dependent on the ligand size in the aromatic ring of the cation. (Author abstract) 9 refs.

Pukacki, W. (Polish Acad of Sciences, Poznan, Pol); Graja, A. *Synth Met* v 24 n 1-2 Apr 1988, Proc of the Second Fr-Pol Colloq on Low Dimens Org Conduct and Electroactive Polym, Nancy, Fr, May 12-15 1987 p 137-143.

**075362 SPECTRAL PROPERTIES OF THE NEW SERIES OF ORGANOMETALLIC TCNQ SALTS WITH METALLOCENE STACKS.** Infrared measurements of a new series of organometallic TCNQ salts with metallocene donors were performed in the out-of-plane vibrational region ( $880\text{-}800\text{ cm}^{-1}$ ) of a TCNQ molecule. Thermal evolution of the spectra has been used as an indicator of the electron localization in the TCNQ chains. (Author abstract) 6 refs.

Pawlak, M. (Polish Acad of Sciences, Poznan, Pol); Graja, A. *Synth Met* v 24 n 1-2 Apr 1988, Proc of the Second Fr-Pol Colloq on Low Dimens Org Conduct and Electroactive Polym, Nancy, Fr, May 12-15 1987 p 145-149.

**075363 E.S.R. AND ELECTRICAL PROPERTIES OF THE ORGANIC METAL (BEDT-TTF) $_4\text{Hg}_3\text{Cl}_8$ .** (BEDT-TTF) $_4\text{Hg}_3\text{Cl}_8$  is a new ion-radical salt in which superconductivity has been observed at 1.7 K under a pressure of 12 kbar. The angular dependences of the g factor and the linewidth,  $\Delta H$ , at room temperature, for three perpendicular crystal orientations have been studied. The angular study of g and  $\Delta H$  indicated strong two dimensionality of the spin ordering of the crystals. The temperature dependences of the spin susceptibility  $\chi$  of monocrystals of (BEDT-TTF) $_4\text{Hg}_3\text{Cl}_8$  were analyzed. Above 220 K, a temperature-independent spin susceptibility seems to characterize the Pauli spin susceptibility;  $\chi$  of (BEDT-TTF) $_4\text{Hg}_3\text{Cl}_8$  was about  $2.1 \times 10^{-4}\text{ emu/mole}$ . The e.s.r. study has been complemented by thermopower, S, measurements along the a and b axes. (Edited author abstract) 7 refs.

## Electronic Properties

**075364 ELECTRONIC STATE OF METALLOPORPHYRINS.** The electronic states of the oxidized and reduced metalloporphyrins were studied to provide a basis for electronic device applications of the molecules. The effective energy level of the d electron in the metal ion has been found to be approximately 1 eV higher than the HOMO level of the  $\pi$  electron in the porphyrin ring. Fe ions in the Fe porphyrin were found to be irreducible when the temperature was much higher than approximately 280 K. (Author abstract) 23 refs.

## Forming

**075365 KINETIC FEATURES OF THE PROCESS OF OLIGOMERIZATION OF DIENE HYDROCARBONS UNDER THE ACTION OF METALLIC SODIUM IN PRESENCE OF TRI-ISOBUTYL ALUMINIUM.** General rules have been determined for the formation of homogeneous organosodium aluminum compounds, capable of initiating anionic polymerization of diene hydrocarbons. It was shown to be possible to regulate the oligomer chain length and the active sodium content in the product by changing the triisobutyl aluminum concentration. In addition, an analysis of the kinetic data showed that the nature of the oligomerization process in presence of TIBA (Tri-Isobutyl Aluminum) differs significantly from the formation of organosodium compounds, without TIBA. (Edited author abstract) 12 refs.

## Ionization

**075366 INVESTIGATION OF FRAGMENTATION PROCESSES FOLLOWING CORE PHOTOIONIZATION OF ORGANOMETALLIC MOLECULES IN THE VAPOR PHASE.** Ionic fragmentation processes following  $(n-1)d$  core level photoionization of organometallic molecules have been studied in the vapor phase using synchrotron radiation. Results on tetramethyllead, tetramethyltin and tetramethylgermanium are reported. The threshold electron spectra and the photoionization efficiency curves of these molecules are presented and discussed. It is concluded that the  $(n-1)d^9$  core-hole state of  $\text{M}(\text{CH}_3)_4$  ( $\text{M} = \text{Pb, Sn or Ge}$ ) is split into five sublevels owing to both the spin-orbit coupling and the electrostatic perturbations by the methyl groups, and that the  $\text{M}^+$  ions are predominantly produced following  $(n-1)d$  photoionization. (Author abstract) 15 refs.

## Isomerization

**075367 SILENE STEREOCHEMISTRY: 5. AN EXPERIMENTAL DETERMINATION OF THE ACTIVATION ENERGY FOR A SILENE TRANS-CIS ISOMERIZATION.** The E- and Z-isomers of 1-methyl-1-phenyl-2-neopentylsilene, generated by the sealed tube thermolyses of their anthracene adducts are stereospecifically trapped by methoxytrimethylsilane to give diastereomeric adducts. Under isomerizing conditions the ratio of the two diastereomers obtained when the silene formed from the pure E-anthracene adduct is trapped is a linear function of the concentration of the trapping reagent. The temperature dependence of permitted the first experimental determination of the activation energy for a silene E- to Z-isomerization of  $43 \pm 6\text{ kcal/mole}$ . (Author abstract) 6 refs.

Jones, Paul Ronald (North Texas State Univ, Denton, TX, USA); Lee, Myong Euy. *Silicon Germanium Tin Lead Compd* v 9 n 2-3 1986, Fifth Int Conf on the Organometal and Coord Chem of Germanium, Tin and Lead, Padua, Italy, Sep 7-11 1986 p 11-18.

**075368 METHANOL-INDUCED ISOMERISATION OF SOME 5-ALKYLCYCLOHEX-2-ENYLSTANNANES.** Predominantly cis-5-methylcyclohex-2-enyltrimethylstannane experiences clean methanol induced isomerization to predominantly (65%) the trans isomer. Approach to equilibrium is first order in stannane and  $^2\text{H}$  labelling indicates a symmetric intermediate is involved. The trans isomer is calculated to be ca 0.4 kcal/mole more stable than the cis such energy difference reflecting a stabilizing  $\sigma-\pi$  interaction (C-Sn bond with  $\pi$  system) in the trans isomer, as well as relief of allylic strain (between  $\text{Sn}(\text{CH}_3)_3$  and  $\text{H}_2$ ) in the cis. The trans-5-*t*-butyl analogue also predominates at equilibrium (c. 79%). (Author abstract) 9 refs.

## Magnetic Properties

**075369 STATIC MAGNETIC SUSCEPTIBILITIES OF POLY(PHENYLETHYNYLCOPPER) DOPED WITH IODINE.** Static magnetic susceptibilities of poly(phenylethynylcopper), doped with iodine, are reported and analysed in view of a simple 'dilute' system of paramagnetic centres in a diamagnetic matrix, the unpaired electron concentration being generated by a thermal activation process. The resulting diamagnetism,  $-3.3 \times 10^{-9} \text{ m}^3 \text{ kg}^{-1}$ , is low suggesting the presence of a temperature independent paramagnetism of  $\geq 0.6 \times 10^{-9} \text{ m}^3 \text{ kg}^{-1}$ . The maximum concentration of unpaired electrons accounted for by the data, taken above 160 K, is  $3.1 \times 10^{-2}$  per mole. The 4.2 K concentration is  $1.8 \times 10^{-3}$  unpaired electrons per mole. The field dependence of the low temperature susceptibility indicates the occurrence of ferromagnetic coupling between unpaired electrons, showing that the 'dilute' model does not hold in the low temperature region. (Author abstract) 6 refs.

## Optical Properties

**075370 OPTICALLY ACTIVE ORGANOIRON COMPLEXES. PREPARATION AND CHEMISTRY.** The achiral and optically active  $\text{Fp}(\text{dioxene})\text{BF}_4$  complexes 2a and 2b ( $\text{Fp}$  = dicarbonylcyclopentadienyliron) are readily prepared from  $\text{Fp}(1,2\text{-dimethoxyethylene})\text{BF}_4$  by glycol exchange reactions. The barrier to ring inversion in these compounds is estimated to be 7.6 kcal/mol from low-temperature  $^{13}\text{C}$  NMR spectral measurements. A crystal structure determination of 2a shows significant distortions due to transannular steric interactions between the  $\text{Fp}$  carbonyl groups and an axial ring proton. Lateral displacement of the  $\text{Fp}$  group along the C-C double-bond axis is also suggested by the X-ray data and is supported by  $^{13}\text{C}$  and  $^1\text{H}$  NMR spectral analyses. (Edited author abstract) 28 refs.

**075371 RUTHENIUM(II)-POLYPYRIDINE CAGE COMPLEXES: LUMINESCENCE AND PHOTO-CHEMICAL PROPERTIES.** The first noncryptand type, spacered tris-bpy-ligand and the first closed cage ruthenium(II)-polypyridine complex have been synthesized. Data are reported concerning the photophysical and photochemical behavior of that cage complex and some related species. The most interesting result is the extraordinary stability of the cage complex toward photodecomposition, about  $10^4$  times higher than that of  $\text{Ru}(\text{bpy})_3^{2+}$ . It is generally agreed that for  $\text{Ru}(\text{bpy})_3^{2+}$  the ligand photosubstitution reaction proceeds via a thermally activated radiationless transition from the luminescent metal-to-ligand charge-transfer ( $^3\text{CT}$ ) level to a distorted metal-centered ( $^3\text{MC}$ ) level, with subsequent cleavage of one Ru-N bond and formation of an intermediate contain-

ing a monodentate bpy ligand. 14 Refs.

## Oxidation See Also IRON OXIDES—Manufacture.

**075372 ELECTROCHEMICAL OXIDATION OF CYCLOPOLYSILANES USING CYCLIC VOLTAMMETRY.** A series of 28 cyclopolysilanes were studied by cyclic voltammetry in dichloromethane and shown to undergo irreversible oxidation at potentials from 0.54 to 1.6 v. Oxidation potentials increase with ring size from  $\text{Si}_3$  to  $\text{Si}_6$ , with the lowest value, 0.54 v, found for the highly strained compound  $[(t\text{-Bu})_2\text{Si}]_3$ . For the dimethyl compounds, potentials decrease again above  $\text{Si}_9$ ; the differences parallel those for the electronic excitation energies of the same compounds. (Author abstract) 28 refs.

## Phase Transitions See Also SOAP—Metallic.

**075373 GROUP-THEORETICAL ANALYSIS OF THE SYMMETRY CHANGES IN  $\text{R}_2\text{MX}_4$  COMPOUNDS.** Commensurate subgroups of  $\text{Pnma}$  are obtained by a group-theoretical method started from the Landau theory of continuous phase transitions. The investigated high symmetry points are  $\Gamma$ , X, Y, Z, R, T, S, U,  $\Sigma$ ,  $\Delta$ , and A. These points belonging to the first Brillouin zone, are the most involved ones according to literature experimental data. The selected order parameter is defined in the basis associated with the corresponding irreducible representation of  $\text{Pnma}$ , so it may represent any physical property. The results are given in table form together with some useful information concerning the low symmetry structure. A particular interest is devoted to  $\text{R}_2\text{MX}_4$  compounds ( $\text{R}$ =organic cation;  $\text{M}=\text{Cu}$ ,  $\text{Cd}$ ,  $\text{Hg}$ ,  $\text{Zn}$ , ...;  $\text{X}=\text{Cl}$ ,  $\text{Br}$ ) where the parent structure has  $\text{Pnma}$  symmetry. (Author abstract) 18 refs.

**075374 CALORIMETRIC STUDY OF THE PHASE TRANSITION IN DEUTERATED METHYLAMMONIUM HEXACHLOROSTANNATE.** The heat capacity of methylammonium- $\text{d}_6$  hexachlorostannate has been measured between 13 and 300 K. A peak due to the phase transition occurred at  $(154.96 \pm 0.06)$  K. Critical properties of the transition were characterized by detailed measurement around  $T_c$ . Models of disorder that carry large enough entropy to explain the experimental transition entropy  $21.8 \text{ J K}^{-1} \text{ mol}^{-1}$  are proposed, with particular attention paid to the symmetry of the two phases. (Author abstract) 18 refs.

## Physical Properties See Also GOLD COMPOUNDS—Physical Properties; SEMICONDUCTOR MATERIALS—Growth.

**075375 INITIAL STUDIES ON A NEW TELLURIUM CONTAINING ORGANIC METAL: TETRATELLURAFULVALENE-TETRACYANOQUINODIMETHANE (TTef-TCNQ).** Experimental conditions for the growth of acicular crystals of the new organic conductor tetratellurafulvalene-tetracyanoquinodimethane (TTef-TCNQ) are reported. The room temperature conductivity along the needle axis was found to be  $1800 \pm 300 (\Omega\text{-cm})^{-1}$ . dc conductivity studies down to 77

K displayed metallic behavior and microwave conductivity studies showed the compound to still be highly conducting at 5 K. EPR studies down to 8 K were performed but no measurable resonances were recorded. Preliminary x-ray scattering studies indicate a segregated stack structure with a stacking distance of  $3.95 \pm 0.01 \text{ \AA}$ . The charge transfer was found to be  $0.71 \pm 0.03 e^-$  from infrared spectroscopy data. In most respects the physical properties of TTef-TCNQ are similar to those of HMTSF-TCNQ. (Author abstract) 10 refs.

## Polarographic Analysis

**075376 POLAROGRAPHIC STUDY OF MIXED COMPLEXES OF  $\text{Mn(II)}$  WITH PYRIDINE AND FORMATE.** The polarographic behavior of manganese(II)-pyridine-formate system has been reported. Rather starting results are obtained upon comparison of the equilibrium constants for the addition of formate anion or pyridine molecule to the various bis ligand complexes. Addition of either a pyridine molecule or a formate anion to  $\text{Mn}(\text{py})_2^{2+}$  would be hindered, despite the opposite charges of the latter two species, while addition of either ligand to  $\text{Mn}(\text{formate})_2$  would proceed more readily. It is possible to explain the observed trends on the assumption that the negatively charged formate anions, each with two oxygen atoms, repel and loosen the coordinated water molecule to a greater extent than do pyridine molecule. 5 refs.

Sharma, Jyoti (Delhi Univ, Delhi, India); Kumar, Arvind; Rao, A.L.J.; Puri, B.K. *J Electrochem Soc India* v 36 n 3 Jul 1987 p 191-192.

**075377 POLAROGRAPHIC STUDY OF COPPER WITH  $\delta$ -VALEROLACTAM AND ITS ANALYTICAL APPLICATIONS.** This work deals with the determination of the thermodynamic parameters and the stability constants of the complexes formed by copper with  $\delta$ -valerolactam at different temperatures i.e. 303, 313 and 323 K. It is found that in most of these cases mixed electrolytes have been used and in certain cases a maximum suppressor is also required. Thus, the sensitivity and accuracy in the measurement of the diffusion-current tend to decrease. 4 refs.

## Processing

**075381 CARBON SORPTION METHOD FOR REMOVAL OF ORGANOTIN-COMPOUND VAPORS FROM WASTE GASES.** Investigations on the adsorption of organotin-compound vapors were carried out on AR-3-type activated carbon at 25°C under dynamic conditions with synthetic vapor-air mixtures at a flow rate of 0.2 m/sec (adsorber diameter of 20 mm) with TET and TBT as the adsorbate. Experimental results show that for concentrations of 7.5 mg/m<sup>3</sup> organotin compounds, 21.5 g/m<sup>3</sup> benzene, and 41.5 g/m<sup>3</sup> ether in the gas before cleaning, the degree of their removal from the gas was 99.1, 99.2, and 91.0%, respectively. After regeneration of the activated carbon by water vapor (at 300°C for 2 h with a vapor consumption of 5-7 kg/kg of the mixture of collected organic substances), the degree of gas cleaning did not decrease, at least in the first two or three adsorption-regeneration cycles. 12 refs.

## Radiation Effects

**075382 RADIOLYTIC REDUCTION OF FERRICETHYLENEDIAMINETETRAACETATE IN AQUEOUS SOLUTION.** Aqueous solution of ferricethylenediaminetetraacetate (F) was radiolyzed in deaerated medium and in the presence of HCOO<sup>-</sup>, 2-propanol, t-butanol, N<sub>2</sub>O and O<sub>2</sub>. The G[Fe(II)] was found to be equal to G(-F). Apart from e<sup>-</sup>(aq) and H atom, CO<sub>2</sub><sup>-</sup>, (CH<sub>3</sub>)<sub>2</sub>C-OH, O<sub>2</sub><sup>-</sup> and HO<sub>2</sub> radicals directly reduced Fe(III) of the chelate; the OH radical did so indirectly through hydrogen abstraction from ligand and reacted more readily with Fe(II) than with F. (Author abstract) 14 refs.

## Reviews

**075386 ORGANO-GERMANIUM, -TIN AND -LEAD CHEMISTRY WITH SULPHUR LIGANDS.** The author presents a brief review of the chemistry of organo-germanium, -tin and -lead derivatives with a few selected sulfur ligands like thiols, dithiols, dialkyldithiophosphates, alkylenedithiophosphates, monothio-β-diketones, β-aminothionates, benzothiozoles and xanthates. A convenient route for synthesis of tin tetracarboxylates from the reaction of tin tetrathiolates with acid anhydrides is highlighted. Tin tetracetate, thus obtained, has been used for the synthesis of a variety of sulfur ligand derivatives of tin. Work has been initiated on some other sulfur ligands like thiocarboxylates and thiocarbamates, including monothiocarbamates are also covered. (Edited author abstract) 125 refs.

**075387 SPECIATION OF METHYL- AND BUTYL-TIN COMPOUNDS AND INORGANIC TIN IN OYSTERS BY HYDRIDE GENERATION ATOMIC ABSORPTION SPECTROMETRY.** This paper describes speciation of inorganic tin, methyltin compounds, and butyltin compounds from oyster samples. We validated the hydride generation atomic absorption spectrophotometric technique by demonstrating ca. 100% recovery from spiked samples and by the absence of any organotin decomposition products. Absolute detection limits (3 σ) are 1.1-2.5 ng for 0.1-g oyster samples (wet weight). This method is superior to published techniques because of careful validation, low limits of detection, and minimal sample manipulation. (Edited author abstract) 19 refs.

**075388 VARIABLE TEMPERATURE FTIR SPECTROSCOPY OF ORGANOTIN THIOCYANATES.** The position of the C-N stretch band center and the temperature dependence of this frequency have been determined for a number of organotin (IV) thiocyanates, including compounds in which the metal atom shows four-, five-, six-, and seven-coordination. A detailed comparison is made between structures involving both bridging and terminal thiocyanate groups of related molecular systems. In compounds in which the SCN group acts as a terminal ligand by bonding through the N atom, the band center is observed in the range 2050 to 2066 cm<sup>-1</sup> and has a temperature dependence of ca. (2.5+1) × 10<sup>-2</sup> cm<sup>-1</sup> K<sup>-1</sup>. In contrast, organotin (IV) compounds in which the ligand acts as a bridging moiety, the band center is observed in the range 2096 to 2116 cm<sup>-1</sup> and shows a wide range of band center temperature dependencies which are related to the molecular level architecture of the metal atom environment. (Edited author abstract) 35 refs.

**075392 NONCLASSICAL UREA OLIGOMERS. IX. PHOTO-REDUCING NATURE OF BINUCLEAR COPPER COMPLEXES OF NONCYCLIC PENDANT-TYPE UREA OLIGOMERS.** The octametric oligomers of 1-(N-substituted-carbamoyl)-aziridine, i.e., N-ureanized-oligo-ethylenimines, form  $Cu(II)$  complexes. When the N-substituents are phenyl(1, 3), methyl(2), and p-tolyl(4) groups, the main portions of the  $Cu(II)$  complexes are binuclear. The binuclear oligomer- $Cu(II)$  complexes showed characteristic properties of photo-reduction of  $Cu(II)$  species, giving rise to stable yellow  $Cu(I)$  species. The ease of photo reduction strongly depends on the oligomer structures, especially on the nature of the pendant-urea groups, i.e.,  $4 > 1,3 > 2$ . In the series of aromatic type urea-oligomers, highly stable photo-radicals were observed in ESR. By using an optically active oligomer (3) the molecular requirements for these characteristic properties were investigated with circular dichroism and cyclic voltammetry. And one of the plausible structures was deduced as the model of binuclear  $Cu(II)$  sites surrounded by oligomeric environments. (Author abstract) 19 refs.

**075393 STRUCTURE - ACTIVITY RELATIONSHIP AND MOLECULAR BONDING PARAMETERS FROM ROOM-TEMPERATURE MULTIFREQUENCY ESR SPECTRA OF ANITUMOR COPPER(II) COMPLEXES.** A rigorous unambiguous way to extract all the necessary magnetic parameters for copper complexes in the fluid phase, by a combination of multifrequency ESR spectroscopy and computer simulation, is presented. By this method, which has the obvious advantage of not changing the physical state of the system, homologue copper complexes with very different cytotoxic and pharmacological activities ( $CuKTS$  and  $CuKTSm_2$ ) were examined. Having extracted the spin Hamiltonian parameters and the rotational correlation time from the room-temperature ESR spectra of the two complexes at multiple frequencies, small differences were found in the isotropic nitrogen coupling constants. This was never appreciated before because of the aggregation occurring in the samples at low temperature. (Edited author abstract) 45 refs.

**075394 CLUSTER SYNTHESIS. 17. SYNTHESIS AND STRUCTURAL CHARACTERIZATIONS OF  $Ru_5(CO)_{15}(\mu_4-S)$ ,  $Ru_6(CO)_{18}(\mu_4-S)$ , AND  $Ru_7(CO)_{21}(\mu_4-S)$ .** The authors have investigated the preparation and structural character of a new series of higher nuclearity ruthenium carbonyl clusters that contain only one sulfido ligand. As with the previous series similarities and differences to the osmium system were observed again. Three new compounds with the formulas  $Ru_5(CO)_{15}(\mu_4-S)$  (2),  $Ru_6(CO)_{18}(\mu_4-S)$  (3), and  $Ru_7(CO)_{21}(\mu_4-S)$  (4) were obtained in yields which varied depending on the amount of  $Ru(CO)_5$  that was initially present, the temperature, and the duration of the reaction period. When heated to  $68^\circ C$  for 10 min in the presence of a 3/1  $Ru(CO)_5/1$  molar ratio, the yields of 2, 3, and 4 were 62%, 9%, and 0%, respectively, but when heated to  $98^\circ C$  for 15 min in a 10/1  $Ru(CO)_5/1$  molar ratio, the yields were 8%, 55%, and 23%, respectively. 16 refs.

**075396 IMPORTANCE OF HYDROGEN BONDING OF ORGANOTIN IN WATER.** We have been studying organotin in situations in which hydrogen bonding is possible, and we conclude that information from non-aqueous phases is largely irrelevant to the situation in water. We review results on the solid-state structures of a number of organotins. We find that in all situations in which hydrogen bonding is possible, it is this feature that predominates in determining the structure, with the organotin moiety accommodating as best it can, relinquishing favored for less-favored bonding partners, adopting lower than maximum possible coordination numbers, forming lattices of ions delocalized by hydrogen bonding rather than expected covalent condensation products and adjusting crystal habits to those determined by the propagation of hydrogen bonds rather than by tin bonds. (Edited author abstract)

**075397  $(\eta^3\text{-PHOSPHAALLYL})\text{IRON COMPLEXES: SYNTHESIS AND PRELIMINARY CHEMICAL STUDY.}$**  Vinylchlorophosphine  $P-W(CO)_5$  complexes react in boiling toluene with  $[CpFe(CO)_2]_2$  to give  $\mu_2$ -vinylphosphido complexes whose phosphorus atom bridges a  $W(CO)_5$  and a  $Fe(CO)_2Cp$  unit. Upon short irradiation, these  $\mu_2$ -complexes yield  $(\eta^3\text{-1-phosphaallyl})Fe(CO)Cp$  complexes as mixtures of two isomers. These two series of isomers undergo a slow equilibration in solution. This equilibration takes place via the decoordination and the upside-down rotation of the vinyl unit followed by a recomplexation of this unit by the iron atom. These two series of isomers differ mainly in the magnitude of the  $^2J(P-C-H)$  coupling constants within the phosphoallyl unit. The constant is high (ca. 30 Hz) when the  $W-P-C-H$  dihedral angle is close to  $0^\circ$  and low (ca. 0 Hz) when this angle is close to  $180^\circ$ . (Edited author abstract) 28 refs.

seau, Fr); Hugel-Le Goff, Catherine; Mathey, Francois. *Organometallics* v 7 n 4 Apr 1988 p 955-963.

**075398 SYNTHESIS AND CHARACTERIZATION OF NEOPENTYL GALLIUM COMPOUNDS.** The authors report the synthesis and characterization of a series of organogallium compounds that incorporate the neopentyl ( $CH_2CMe_3 = Np$ ) group including  $GaNp_3$ ,  $GaNp_2Cl$ ,  $GaNp_2Br$ ,  $GaNpCl_2$ , and  $GaNpI_2$ . These neopentylgallium derivatives are of chemical interest because the bulky neopentyl substituent with no  $\beta$ -hydrogen atoms might introduce unusual chemical properties. A comparison of the properties of the neopentyl- and (trimethylsilyl)methylgallium derivatives suggest that the neopentyl group has larger steric effects and stronger electron-withdrawing properties than the corresponding (trimethylsilyl)methyl substituents. 13 refs.

## Testing

**075401 INTERACTION OF TRIALKYLALUMINUM REAGENTS WITH METAL-BOUND ETHYLENE AND CARBON MONOXIDE. THE MOLECULAR STRUCTURE OF  $(\eta^5-C_5Me_5)_2Ta(H)(C_2H_4 \cdot AlEt_3)$ .** The compounds  $(\eta^5-C_5Me_5)_2M(H)(C_2H_4)$  and  $(\eta^5-C_5Me_5)_2M(H)(CO)$  ( $M = Nb, Ta$ ) reversibly bind trialkylaluminum reagents to give 1:1 adducts in which the aluminum is bonded to the metal-bound ethylene or carbonyl oxygen in preference to the hydride ligand. The mixed-ring compound  $(\eta^5-C_5Me_5)(\eta^5-C_5H_5)Ta(H)(CO)$ , in contrast, binds aluminum at the hydride ligand. This structure displays an unusual ethylene bridge between the aluminum and tantalum centers. The significance of these adducts in the context of Ziegler-Natta catalysis and migratory insertion is discussed. (Edited author abstract) 34 refs.

## Thermodynamic Properties

**075402 KINETICS, MECHANISM, AND THERMODYNAMIC ASPECTS OF THE INTERCONVERSION OF COMPLEXES OF PLANAR AND NON-PLANAR METALLO-AMIDO-N GROUPS.** In this report we discuss the first mechanistic study of facile isomerizations of diastereomeric complexes in which planar and nonplanar amido-N ligands are interconverted. The accumulated evidence consistently suggests that the T mechanism most reasonably describes the isomerizations of the systems studied. While the focus here has been upon processes occurring at a transition-metal center, the isomerization reactions interconvert cis- $\alpha$  and trans diastereomers where the enthalpy difference is primarily a result of the presence of nonplanar amido-N ligands in the former and planar amido-N ligands in the latter. 15 refs.

## Transport Properties

**075403 TRANSPORT OF COPPER AMINES THROUGH A CATION-EXCHANGE MEMBRANE DURING ELECTRODIALYSIS.** Extraction of copper amine complexes from wastewaters in electroplating technology and in production of cuprammonium fibers is an important problem, and electrodialysis with ion-exchange membranes is the most promising method of solving it. Our aim was to study transport of copper(II) amines through a commercial cation-exchange membrane of the MK-40 type. These experiments lead to the conclusion that electrodialysis of copper(II) amine complexes is possible only at current densities below the limiting values and that the transport is accompanied by decrease of the formation function of the complexes both in the membrane and in the solution of the concentrate receiving compartment. 5 refs.

## Vapor Pressure

**075404 DETERMINATION OF VAPOUR PRESSURES AND DIFFUSION COEFFICIENTS OF BIS- $\mu$ -(DIISOPROPYLLAMIDO) TETRAMETHYL DI-ALUMINIUM (III) AND BIS- $\mu$ -(DITERTIARYBUTYLPHOSPHIDO) TETRAMETHYL DI-INDIUM (III).** Vapor pressures of the two title compounds were measured using Knudsen mass loss effusion and the modified entrainment method. From this data the enthalpies and entropies of sublimation were calculated, in addition to the binary diffusion coefficient in nitrogen. Plots of  $\log P$  vs.  $1/T$  were linear: i.e.  $\log P(\text{Torr}) = -A/T + B$ ; where for bis- $\mu$ -(diisopropylamido) tetramethyl di-aluminum (III),  $A=5180$  and  $B=13.2$ , and for bis- $\mu$ -(ditertiarybutylphosphido) tetramethyl di-indium (III),  $A=6790$  and  $B=14.2$ . The binary diffusion coefficients in nitrogen at 373 K were calculated to be  $6.4 \times 10^{-6} \text{ m}^2 \text{ s}^{-1}$  and  $4.7 \times 10^{-6} \text{ m}^2 \text{ s}^{-1}$  respectively. (Author abstract) 12 refs.

**075408 ROBUST CLOSED-LOOP CONTROL OF ISOMETRIC MUSCLE FORCE USING PULSE-WIDTH MODULATION.** The design of feedback controllers to accurately and robustly regulate the properties of electrically stimulated muscle is considered. Reliable, precise control is necessary for the development of neuroprosthetic devices to improve gradation and repeatability of force. A digital closed-loop controller has been developed which regulates muscle force by modulating the pulsewidth of a constant-amplitude electrical stimulation pulse train. This controller has been evaluated in slow- and fast-twitch muscles (cat soleus and plantaris) in acute experiments. In isometric tests, it was found to regulate muscle force with low sensitivity to modeling errors and disturbances while satisfying stability, repeatability, linearity, and step/ramp response criteria over a wide range of commands. 18 refs.

**075409 PRACTICAL LOW COST STAND/SIT SYSTEM FOR MID-THORACIC PARAPLEGICS.** The use of functional electrical stimulation (FES) to enable paraplegics to stand is not new or indeed difficult to undertake under laboratory conditions. However, there are substantial problems to overcome before such systems can be used routinely by patients without professional supervision. The overriding consideration has to be one of safety, i.e. the system must be 'fail safe'. Second, the system must be quick and easy to use in a wide variety of locations, otherwise it will not provide any increase in function. Finally, it must be inexpensive enough to be available to a large number of paraplegics. The primary aim of our work was to provide such a system to enable mid-thoracic lesion paraplegics to stand wherever they wish. This involved the development of a microprocessor-based simulator to enable the stimulating envelope to be individually tailored to a given patient's requirements and the provision of closed loop control to minimize fatigue. A folding standing frame was also designed which replaces the arm rests on a standard wheelchair. Using this system, the user is able to stand within 30 s of stopping

and can remain standing up to 10 min. Cosmic calipers (knee-ankle-foot orthoses) are also being used for paraplegics who require to stand for longer periods. (Edited author abstract) 11 refs.

**075410 HYBRID FES ORTHOSIS INCORPORATING CLOSED LOOP CONTROL AND SENSORY FEEDBACK.** A hybrid functional electrical stimulation (FES) orthosis is described, comprising a rigid ankle-foot brace, a multi-channel FES stimulator with surface electrodes, body mounted sensors, a 'rule-based' controller and an electro-cutaneous display for supplementary sensory feedback. The mechanical brace provides stability, without FES activation of muscles, for standing postures normally adopted by patients. This avoids incurring muscle fatigue during prolonged upright activity. However, stability is conditional upon the position of the ground reaction vector (GRV) relative to the knee joint. The finite state FES controller reacts automatically to destabilizing shifts of the GRV by stimulating appropriate anti-gravity musculature to brace the leg. The FES system also features a control mode to initiate and terminate flexion of the leg during forward progression. A simple mode of supplementary sensory feedback was used during the laboratory standing tests to assist the patient in maintaining a set posture. Preliminary results of laboratory tests for two spinal cord injured subjects are presented. (Author abstract) 7 refs.

Andrews, B.J. (Univ of Strathclyde, Scotl); Baxendale, R.H.; Barnett, R.; Phillips, G.F.; Yamazaki, T.; Paul, J.P.; Freeman, P.A. *J Biomed Eng* v 10 n 2 Apr 1988, Pap Presented at the 27th Annu Sci Meet of the Biol Eng Soc, Oxford, Engl, Sep 2-4 1987 p 189-195.

**075411 REDUCTION OF MUSCLE FATIGUE IN MAN BY CYCLICAL STIMULATION.** In order to develop a control system for electrical stimulation of paralyzed muscle and improve muscle resistance to fatigue, it is useful to investigate the possibility of stimulating the control systems of the normal body. One way is the periodic shifting of stimulation from one muscle to another. This technique is called sequential stimulation and allows sufficient rest time for each muscle to reduce fatigue and consequently prolong muscle strength. It can also be seen to improve the muscle recovery time. In the following study, the muscles rectus femoris, vastus lateralis, and vastus medialis were used to keep the knee locked and extended during stimulation. Several experiments were carried out using a three-channel computer controlled stimulator. The results for three-phase sequential stimulation (33% duty cycle per muscle) were most effective and significantly improved the muscle fatigue characteristics. (Author abstract) 6 refs.

Pournezam, M. (Univ of Strathclyde, Glasgow, Scotl); Andrews, B.J.; Baxendale, R.H.; Phillips, G.F.; Paul, J.P. *J Biomed Eng* v 10 n 2 Apr 1988, Pap Presented at the 27th Annu Sci Meet of the Biol Eng Soc, Oxford, Engl, Sep 2-4 1987 p 196-200.

**075412 BASIC MODULE FOR AN ADAPTIVE CONTROL SYSTEM BASED ON NEURONE INFORMATION PROCESSING.** The design of such devices as robotic aids for handicapped people, powered prostheses and manipulative aids such as page turners would benefit from the use of an adaptive system. Much recent work on adaptive networks has been based on simplified models of the information processing capabilities of neurons. Neurons are known to be capable of association learning and memory and this study incorporates these features in a neurone model. A single neuronal input system, the NMDA-type glutamate receptor, is modeled by deriving finite difference equations from its reaction dynamics so that the concentration of several molecules in the receptor can be plotted as a function of time. The model shows association learning taking place

at the glutamate receptor. A whole neurone with ten glutamate receptor regions is also modeled and shows that a neurone should be capable of recognizing patterns of inputs. As the neurone model is complicated and slow to run, a much simplified form of the model is described which embodies the basic features of neurone information processing in a simple algorithm. (Author abstract) 9 refs.

Orpwood, R.D. (St. Martin's Hospital, Bath, Engl.) *J Biomed Eng* v 10 n 2 Apr 1988, Pap Presented at the 27th Annu Sci Meet of the Biol Eng Soc, Oxford, Engl, Sep 2-4 1987 p 201-205.

**Functional Neural Stimulation** See Also BIOMEDICAL ENGINEERING—Electromyography; ELECTROTHERAPEUTICS—Medical Applications.

**075413 CHARACTERIZATION AND CONTROL OF MUSCLE RESPONSE TO ELECTRICAL STIMULATION.** The maintenance of upright posture in neurologically intact human subjects is mediated by two major nervous pathways. The first, leading from the cerebral cortex through the spinal cord to motor neurons, activates muscles which produce postural movements. The second, leading from various sensory organs to higher centers, provides sensory feedback regarding the postural state. The path through the spinal cord is no longer intact in victims of spinal cord injury and loss of normal control of muscle activity results. Functional neuromuscular stimulation (FNS) has been shown as a feasible method for obtaining muscle contraction in paraplegics and has been proposed as a means for control of antero-posterior sway to make upright posture possible for these individuals. (Edited author abstract) 18 refs.

**075414 CLINICAL ELECTROEJACULATION.** Anejaculation is a disorder that occurs infrequently in the general population, but it occurs in some cases of spinal cord injury and dissection of retroperitoneal lymph nodes for testicular cancer. It is associated with multiple sclerosis, transverse myelitis, and diabetes mellitus. Electro-ejaculation, which involves electrodes in a probe placed in the rectum, electrically stimulates emission of seminal fluid. Semen thus obtained can be used for artificial insemination if a patient and his spouse wish to become natural parents. (Author abstract) 31 refs.

**075415 RF POWERING OF MILLIMETER- AND SUBMILLIMETER-SIZED NEURAL PROSTHETIC IMPLANTS.** The size of the transducers for neural stimulation has shrunk steadily with application of thin-film techniques to electrode design. The feasibility is examined of designing millimeter- and submillimeter-sized power sources based on RF coupling that could be integrated into these implants to provide power without a tethering power cable. The coupling between a transmitter coil and receiver coil when the coil diameters are markedly different is analyzed, and for these circumstances, a simple Thevenin equivalent model is developed to describe the power transmission between the transmitter and receiver. The equivalent circuit developed gives insight into the way that coil diameters, frequency, and turns affect coupling between large and small coils. Several examples demonstrate that milliwatt range power sources can be implemented with millimeter- and submillimeter-diameter receivers.

Heetderks, William J. (Nat'l Inst of Health, Bethesda, MD, USA). *IEEE Trans Biomed Eng* v 35 n 5 May 1988 p 323-327.

**075416 SPECTRAL ANALYSIS INTERPRETATION OF ELECTRO-SURGICAL GENERATOR NERVE AND MUSCLE STIMULATION.** The frequency spectra of two commercial electrosurgical generators were examined during stimulated tissue cutting and compared to radio-frequency animal nerve and muscle stimulation curves generated from high-frequency sinusoi-

dal current. During electrosurgical cutting, significant energy can exist at the fundamental frequency, as well as at frequencies lower and greater than the fundamental, which may be stimulatory to both nerve and muscle tissue. Different types of biological loads did not seem to significantly affect the spectra of each individual electrosurgical unit (ESU). However, the interaction of a specific ESU output with the biological load when compared to a pure resistive load accounts for varying impedances and resultant modulations of the fundamental frequency. Reducing electrosurgical side effects and hazards may depend, in part, on a better understanding of these underlying mechanisms. 13 refs.

**075418 TWO-MINIMUM-COMPONENT SINGLE CURRENT CONVEYOR RC OSCILLATORS.** Two minimum-component RC-sinusoidal oscillator circuits using current conveyors are presented. Each circuit uses a single current conveyor, two resistors and two capacitors. The two circuits enjoy low sensitivities. (Author abstract) 11 refs.

Abuelma'atti, Muhammad Taher (Univ of Bahrain, Isa Town, Bahrain). *Int J Electron* v 63 n 4 Oct 1987 p 509-512.

**075419 NONLINEAR OSCILLATOR LANCHES-TER DAMPER.** The method of multiple scales is used to investigate the effect of a nonlinear spring in the main system on the performance of Lanchester-type absorbers. A second-order uniform expansion is obtained for the response of the system to a harmonic excitation. Numerical results for steady-state solutions illustrating the influence of the nonlinearity and damping factors on the response are presented. A softening-type effective nonlinearity dominates the system and considerably improves its damping. (Author abstract) 10 refs.

Asfar, K.R. (Virginia Polytechnic Inst & State Univ, Blacksburg, VA, USA); Nayfeh, A.H.; Barrash, K.A. *J Vib Acoust Stress Reliab Des* v 109 n 4 Oct 1987 p 343-347.

**075420 IMPACT DAMPED HARMONIC OSCILLATOR IN FREE DECAY.** The impact-damped oscillator in free decay is studied by using time history solutions. A large range of oscillator amplitude is covered. The

amount of damping is correlated with the behavior of the impacting mass. There are three behavior regimes: a low-amplitude range with less than one impact per cycle and very low damping; a useful middle amplitude range with a finite number of impacts per cycle; and a high-amplitude range with an infinite number of impacts per cycle and progressively decreasing damping. The system exhibits jump phenomena and period doublings. An impactor with 2 percent of the oscillator's mass can produce a loss factor near 0.1. (Edited author abstract) 9 refs.

Brown, G.V. (NASA, Cleveland, OH, USA); North, C.M. *NASA Tech Memo* 89897 Sep 1987 22p.

**075421 MINIMAL REALIZATION OF RC OSCILLATORS - A SYNTHESIS APPROACH.** A systematic synthesis of sinusoidal minimal RC oscillators is presented. Basically, it is shown that the realization of a single (ideal) operational amplifier oscillator calls for the realization of a passive notch filter. Minimal RC realization of this notch filter is then obtained by various known synthesis procedures. Additional oscillators are obtained through horizontal and/or vertical rotatory transformations on this notch network. Thus, in all 16 minimal oscillators are derived out of which 3 are believed to be new. (Author abstract) 9 refs.

**075422 CLOCK OSCILLATOR AND CLOCK RECOVERY CIRCUIT FOR DIGITAL TRANSMISSION UP TO 200 Mbit/s.** A clock oscillator and clock recovery circuit have been developed for synchronous transmission at high data rates. The frequency of the oscillator determines the modulation rate of the transmit section of a transmission system while the clock recovery circuit extracts the clock from the received data and regenerates the data signal. The compact design of the clock recovery circuit and the high quality of its signal processing despite small dimensions are the chief attractions of this unit as a system module. (Author abstract) 2 refs.

Schroedinger, Karl (Siemens AG, Munich, West Ger). *Siemens Compon* v 22 n 6 Dec 1987 p 225-229.

**075423 ON THE METHOD OF CALCULATING FRANCK-CONDON FACTORS (I): THE CASE OF HARMONIC OSCILLATORS.** The authors derive a simple formula for Franck-Condon factors in the harmonic oscillator approximation using an addition theorem for Hermite polynomials. One of the most important characteristics of the formula is that the parameters do not take any imaginary values irrespective as to whether or not  $f$  (being the ratio of the frequency in the excited state to that in the ground state) is larger than unity. The formula is simpler than Forsch's in a case of absorption or emission where a thermally equilibrated vibrational state plays an important role at the initial level. In Japanese. 6 refs.

**075424 LOW NOISE mm-WAVE TRANSMITTER TUBE OSCILLATORS.** Recent developments in extended interaction oscillators (EIOs) have produced low noise mm-wave radar-transmitter-tube oscillators suitable for use in coherent radar systems. This article focuses on the methods of generating power in the frequency range from 30 to 300 GHz and at power levels from 1 kW to 1 W of CW power using a bi-periodic ladder slow-wave circuit in the EIO. It also discusses the measurement of the phase noise exhibited by these oscillators. 2 refs.

**075425 CURRENT-TUNABLE SINUSOIDAL OSCILLATOR.** A high-performance integrable current-tunable sinusoidal oscillator is proposed and experimentally investigated. A current-tunable bandpass filter is used as the frequency-determining network. Practical frequency-sweep ranges of approximately three orders of magnitude have been obtained. The maximum useful frequency of oscillation is in excess of 20 MHz, and the total harmonic distortions can be adjusted easily to be less than 0.5%. The measured temperature coefficient of the oscillation frequency is less than -30 ppm/°C. The circuit technique is simple enough for use in the construction of practical instrumental oscillators using only a few off-the-shelf integrated circuit packages. 15 refs.

**075426 LINEAR VOLTAGE CONTROLLED OSCILLATOR.** A description is given of a sinusoidal oscillator having a frequency of oscillation that can be controlled by a controlling voltage. The circuit gives ultralow distortion and stable output by virtue of an automatic gain control (AGC) loop. The oscillator is useful for the VLF (3-30 kHz) and LF (30 kHz-300 kHz) ranges of operation. The circuit uses all grounded capacitors, which are suitable for large-scale integration. 6 refs.

**075431 TAPERED WIGGLER ANALYSIS OF HIGH GAIN FREE ELECTRON LASER OSCILLATORS.** The development of lasers in which the active medium is a relativistic stream of free electrons has evoked much interest. The prospect of operating these continuously tunable, high gain devices at high efficiencies by appropriately tapering the wiggler field parameters has significantly increased the interest in these devices. Variable parameter wiggler free electron lasers have been previously considered for operation in the amplifier configuration and also in the micropulse, low gain operation in the oscillator configuration. The present analysis extends the range of application to the case of intense, long pulsed electron beams in which the self-consistently derived space charge potential (arising from the axial bunching of the particles in the beat wave) is not negligible. Also included in this analysis are arbitrarily relativistic beams (i.e. no ultrarelativistic beam approximation). We have obtained theoretical expressions for the nonlinear efficiency and present a comparison of these results with a fully nonlinear simulation. (Author abstract) 6 refs.

**075433 ACCURATE OSCILLATOR STRENGTHS.** Accurate multiconfiguration Hartree-Fock (MCHF) f-values are compared with the most reliable theoretical values obtained by other theories and recent laser beam experiments. For the  $2^3S-2^3P$  transition in Li II, MCHF results are in excellent agreement with those of Schiff et al. For the resonance transitions of Li I, Na I, and K I, particular attention is given to core effects. It is shown that in core-polarization calculation, the theoretical ionization energy of the valence electron is larger than the observed ionization, that the inclusion of radial correlation in the core decreases the theoretical ionization energy and brings length and velocity forms of the f-values into better agreement. The effect on the oscillator strength was to increase the length form and the discrepancy with the experimental values of Gaupp et al. (Author abstract) 18 refs.

**075434 EIGENPROPERTIES OF NONCLASSICALLY DAMPED PRIMARY STRUCTURE AND OSCILLATOR SYSTEMS.** The calculation of the combined eigenproperties of a nonclassically damped structure and a supported equipment is of practical interest. Herein an approach is developed whereby these properties

can be obtained, in terms of the eigenproperties of the structure and equipment, without a conventional eigenvalue analysis of the combined system. The eigenvalues are obtained as the solutions of a nonlinear characteristic equation, easily solvable by a simple Newton-Raphson scheme. Once the eigenvalues are known, the corresponding eigenvectors can be obtained from closed-form expressions. The approach can also be used effectively to obtain exact eigenproperties for very light as well as very heavy equipment supported on structures. (Author abstract)

**075436 MULTIMODE OSCILLATOR ANALYSIS VIA INTEGRAL MANIFOLDS. PART I: NON-RESONANT CASE.** This article represents Part I of a two-part paper which provides a rigorous mathematical foundation of the mode-analysis method for analyzing the periodic and quasi-periodic oscillations observed in various types of coupled oscillators. Although the results predicted by this method had been confirmed by experiments to some extent, the crucial assumptions used to derive the averaged equations are based on engineering intuition. This paper resolves the theoretical ambiguities of the mode analysis method by using the theory of integral manifolds. In particular, we recalculate the averaged equations in a rigorous way, and show that they coincide with those obtained before. Therefore, the theory of integral manifolds guarantees the existence of an integral manifold in the original system that corresponds to a steady-state periodic or quasi-periodic solution, provided the equilibrium point of the averaged equation has no eigenvalues with a zero real part (i.e., hyperbolic). This rigorous analysis proved that all our previous results obtained from the mode analysis method, i.e., averaged equations and stability analysis, were correct. (Edited author abstract) 20 refs.

**075437 MULTIMODE OSCILLATOR ANALYSIS VIA INTEGRAL MANIFOLDS. PART II: RESONANT CASE.** By using the theory of integral manifolds, we give a rigorous derivation of the average equations of multimode oscillators, which we previously derived by intuitive method. In this part II, two kinds of weakly-non-linear multimode oscillators in the resonant frequency case are rigorously investigated: namely, a ring array with a third-power non-linearity, and a square array with a third-power non-linearity. Moreover, we proved the existence of integral manifolds associated with non-resonant single modes, non-resonant double modes as well as resonant double modes of each array of oscillators. We also prove that there exist two kinds of resonant double modes: a phase-determinate type and a phase-indeterminate type. In coupled oscillator systems, there exist various equilibrium points in the averaged equations. They correspond physically to a variety of oscillations with different frequencies, including both periodic and quasi-periodic oscillations. From our rigorous stability analysis, we prove that all non-resonant single modes, all phase-determinant resonant double modes, and all phase-indeterminant resonant double modes are stable for the ring array. Moreover, we prove

that there exist two non-resonant single modes, three non-resonant double modes, and one resonant double mode for the ( $\# \times 4$ ) square array. 21 refs.

**075438 SYMMETRY, LOCAL SYMMETRY AND ASYMPTOTIC PAUSES OF THE STEADY-STATE CURRENT RESPONSE OF SOME OSCILLATORY CIRCUITS TO PERIODIC RECTANGULAR VOLTAGE WAVES.** Steady-state current response of some passive oscillatory circuits to a periodic rectangular (r.) voltage wave is analysed with the requirement that the set of the voltage jump points (j.p.) be included in the set of the current zero-points (z.p.). The latter states a correspondence between the circuit and the r. wave which is not associated directly with a resonance phenomenon. The analysis reveals some interesting properties of the current response; for instance, possible pauses (the intervals where the current is identically zero) and a strong sensitivity of the current function waveform to small changes in some positions of the j.p. of the r. wave. Conclusions are derived also for nonperiodic input voltage waves. The basic results are associated mainly with a symmetry of the r. wave and (or) with a symmetry of a circuit response function to a shock, which makes the analysis relevant for linear and nonlinear circuits. (Author abstract) 10 refs.

**075439 RESONANCE FREQUENCIES AND BEHAVIOUR OF THE IMPATT CAP OSCILLATOR.** The oscillation frequency of impatt cap oscillators is close to the frequency of the resonator formed by the cap and the diode capsule. In the design of the oscillator or interpretation of its behavior, knowledge of the cap resonance frequencies and of their dependence upon the geometry and characteristics of the diode is desirable. Assuming radial wave propagation beneath the cap with either shunt or 'cross' connection of the diode, good agreement between the measured and estimated resonance frequencies was obtained. Including the cap representative circuit in that for the oscillator, the tuning characteristics were derived assuming a capacitive reactance for the diode. (Edited author abstract) 8 refs.

**075448 4GHz SYNTHESIZED LOCAL OSCILLATOR DESIGN.** The radio-frequency spectrum analyzer, like its relative the communications receiver, has to meet ever more demanding requirements as communication technology advances. The signals to be analyzed can cover a very large range of amplitudes (dynamic range), and be closely-spaced in frequency, making it difficult to resolve the individual spectral components. Accuracy and resolution is essential to make high quality measurements. The analyzer's local oscillator system is crucial to obtaining good resolution, and forms the subject of this article. Some of the design considerations and building blocks are reviewed, with a high performance 100Hz-4.2GHz spectrum analyzer used as an example of a practical design.

## Electric Conductivity

**075455 STARTING PHENOMENON IN NEGATIVE RESISTANCE FET OSCILLATORS.** The letter provides a study and an explanation of the starting phenomenon in an FET oscillator. It has been shown that the behaviour of the negative resistance with the amplitude of the signal leads to a lag effect in the response of the oscillator. This effect is due to the nonlinearity of the transconductance of the active device. Simulations have been made using accurate large signal models included in a time domain analysis software package. (Author abstract). 1 Ref.

**075456 EFFICIENCY AND SIDEBAND OBSERVATIONS OF A RAMAN FEL OSCILLATOR WITH A TAPERED UNDULATOR.** Power and spectral measurements are reported from the Columbia Raman free-electron laser (FEL) oscillator experiment. High-power radiation pulses (approx. 12 MW, 100 ns) are generated at a wavelength of approx. 2.5 mm, using a 750-kV electron beam injected into a helical undulator. The undulator is made up of a 40-cm long constant-period (1.45 cm) section followed by an equal length of tapered undulator. The period is decreased by 7.6% in such a way that the on-axis field remains constant. It is reported that the taper allows an increase in total power efficiency from

approx. 4 to approx. 12%. Most noteworthy is that the tapered undulator reduces the sideband radiation compared with a constant-period undulator FEL which was studied in the same configuration. The power was measured calorimetrically and compared with the results of a 1-D Raman code. The reduction of sideband power observed in the experiment was consistent with computational results obtained with a 2-D sideband code. 14 refs.

## Mathematical Models

**075457 CHARACTERISTICS OF NUMERICAL SIMULATIONS OF CHAOTIC SYSTEMS.** A generalized form of Duffing's Equation is examined in order to gain insight into the characteristics and properties of chaotic motions. It is shown that variations in the forcing function parameters as well as variations in the system's initial conditions can lead to a chaotic response. The incidence of chaos is presented in the form of chaos maps and the structure of these maps is discussed. The influence of linear spring force on these maps is also examined. Finally, it is shown that an improper choice of time step can cause spurious results with regard to the existence of chaotic motion. (Author abstract) 19 refs.

Tongue, B.H. (Georgia Inst of Technology, Atlanta, GA, USA). *J Appl Mech Trans ASME* v 54 n 3 Sep 1987 p 695-699.

**075458 MATHEMATICAL MODEL OF A QUASI-PERIODIC OSCILLATOR.** A method for constructing mathematical models of quasi-periodic oscillators is developed. The signal is represented by the sum of an arbitrary number of harmonic components with specified amplitudes and frequencies. A computer model of a generator of the sum of two harmonic oscillations is constructed as an example. (Author abstract) 10 refs.

**075459 LOEB'S CRITERION AND 'LATCH-UP' EFFECT IN SECOND ORDER OSCILLATORS WITH SINGLE OA.** The aim of this paper is to show that Loeb's criterion in 2nd-order oscillators with a single operational amplifier enables a linear interpretation. The 'latch-up' effect in these systems can be also predicted by a linear theory. (Author abstract) 13 refs.

Martinez, P.A. (Univ de Zaragoza, Spain); Carlosena, A.; Barquillas, J. *Int J Electron* v 63 n 5 Nov 1987 p 655-660.

**075460 NONLINEAR NEGATRON MODEL OF ACTIVE THREE-ELECTRODE DEVICES WITH FEEDBACK.** Different three-electrode oscillators (triode, transistor circuits) may be considered from a common viewpoint due to the fact that their output characteristics are quite similar. Analysis of the behavior of such oscillators is ordinarily based on approximation of the characteristics by broken-line curves and on introduction of two or even three cutoff angles. The optimal regime is taken to be the critical regime for which the current impulse at the output is largest and there is no dip in the pulse. We attempt a simple determination of the parameters of a negatron model for a three-electrode self-excited oscillator with an active device (triode, transistor, field-effect transistor) operating in undervoltage and overvoltage modes. 5 refs.

Malyshev, I.V.; Obolenskii, A.S. *Radioelectron Commun Syst* v 30 n 3 1987 p 82-84.

**075461 CURRENT-CONVEYOR SINE-WAVE OSCILLATORS.** The current-conveyor has attracted the attention of many researchers in the field of active filters and oscillators. Over the past few years, a number of schemes have been developed for realizing single current-conveyor active-RC sinusoidal oscillators. But papers available on this subject are concerned only with one new circuit in each paper. Our objective in this article is therefore to provide a unified treatment for single cur-

rent-conveyor active-RC sinusoidal oscillator circuits. Apart from the obvious advantage of unifying the analysis of this class of oscillator, this treatment leads to the systematic discovery of numerous single current-conveyor active-RC sinusoidal oscillators. 10 refs.

**075462 RELATING THE ALLAN VARIANCE TO THE DIFFUSION COEFFICIENTS OF A LINEAR STOCHASTIC DIFFERENTIAL EQUATION MODEL FOR PRECISION OSCILLATORS.** Models of clock errors are of interest in understanding the NAVSTAR Global Position System Control Segment as well as in the design and simulation of user equipment. In these practical situations, the question of how the clock model's noise properties relate to the Allan variance is important. In particular, the relationship between the diffusion coefficients or so-called process noise parameters for the stochastic differential equation often used in Kalman filters to model the behavior of oscillators, and the Allan variance, must be understood. The relationship is stated and derived using integrals of stochastic processes as the natural tool.

## Medical Applications

**075463 SINE-QUADRATURE OSCILLATOR FOR CELLULAR SPIN RESONANCE UP TO 120 MHZ.** Living or dead cells influenced by a rotating electric field can be observed to spin. This phenomenon is called cellular spin resonance or CSR (Mischel et al., 1982; Arnold et al., 1982). This behavior depends on the electrical properties of the cell and of the surrounding medium and also on the amplitude and frequency of the rotating field. Around 100 kHz, living cells spin against the field's sense of rotation, whilst beyond 1 MHz they spin with the field. So far, experimental results exist only up to 10 MHz (Gimsa et al., 1985). Calculations (Fuhr et al., 1985) predict a spinning resonance somewhat below 100 MHz. The author describes a circuit which provides rotating fields up to 120 MHz at amplitudes of  $2 \mu\text{p-p}$  (at 50Ω). With this instrument it has been possible for the first time to prove that the predicted resonance is correct. The circuit diagram is provided. 5 refs.

**075465 MONOLITHIC MILLIMETRE-WAVE OSCILLATOR USING A TRANSMISSION LINE PERIODICALLY LOADED BY QWITT DIODES.** A small-signal analysis of a travelling-wave structure implemented by periodically loading a parallel-plate waveguide with either resonant tunnelling or QWITT diodes is presented. A small-signal equivalent circuit is used to determine the diode impedance as a function of frequency. The periodicity of the structure, i.e. the distance between adjacent diodes, determines the oscillation (resonant) frequency of the circuit. The analysis shows that change

in the oscillation frequency through variation in the design width and thickness of the waveguide is minimal. The physical dimensions of the waveguide facilitate monolithic fabrication of the oscillator circuit. (Author abstract) 8 refs.

**075471 MEASURING VCO TIME VARYING FREQUENCY CHARACTERISTICS.** Many time-dependent characteristics of high frequency VCOs, such as settling time and post-tuning drift, traditionally have been difficult to measure. This technique, using an EIP model 588 pulsed frequency counter and a delaying pulse generator, facilitates accurate measurements of time varying frequencies. This concept may be used for any application where the frequency varies with time, such as settling time and post-tuning drift. The technique can be automated using the GPIB (IEEE 488) bus.

Beers, Ray (EIP Microwave Inc, San Jose, CA, USA); Hughes, Andy. *Microwave J* v 30 n 11 Nov 1987 p 201-203.

**075472 VCO TECHNIQUES FOR EW SYSTEMS.** Improvements in technology and design have yielded VCO and LO components with reduced size and power consumption and improved overall electrical performance. Steadily increasing complexity of next-generation EW systems, resulting from a dynamic threat environment, has placed added burdens on the VCO and LO designer to provide more complex subsystems. Wider frequency coverage, faster tuning response, improved stability over frequency and temperature, and reduced volume and input power budgets have been necessary. Future trends include predictive jamming techniques, 'smart' control circuitry with real time adjustments, integration of battlefield ECM systems with other EW and command functions, and utilization of active decoys and expendables. (Author abstract) 6 refs.

Boyd, David A. (Litton Electron Devices, San Jose, CA, USA). *Microwave J* v 31 n 2 Feb 1988 6p between p 129 and 137.

**075473 LINEAR SINUSOIDAL VCO.** This paper presents a sinusoidal oscillator whose frequency of oscillation bears a linear relationship with the controlling voltage  $V_x$ . The basic configuration incorporates two four-quadrant analogue multipliers in conjunction with an RC network of which two capacitors are grounded. The circuit is found to show an ultra-low distortion output. The realization of the basic configuration uses two grounded capacitors which are suitable for LSI implementation of the oscillator circuit. (Author abstract) 5 refs.

## Quartz Applications

**075475 ACCELERATION SENSITIVITY OF QUARTZ CRYSTAL OSCILLATORS: A REVIEW.** A tutorial on navigation, radar, and identification systems is presented. The topics discussed are the consequences of acceleration sensitivity in crystal oscillators on the Allan variance, including the effects of sinusoidal and random vibration, phase noise and integrated phase jitter; the vector nature of quartz resonator sensitivity; the theoretical description of the cause of the acceleration sensitivity of quartz resonators; techniques for the measurement of acceleration sensitivity; and the effect of frequency multiplication on acceleration effect. Various techniques currently being used or developed for reducing the effective acceleration sensitivity are considered. The techniques fall into three general categories: reduction of the acceleration sensitivity of the resonator; passive techniques that use compensating elements in the oscillator feedback loop, e.g., a second resonator or an acceleration sensitivity capacitor; and active acceleration compensation schemes that sense the acceleration and feedback a compensating

signal to a tuning network. 60 refs.

## Research

**075476 STUDY OF DIFFRACTION RADIATION OSCILLATION.** The theoretical and experimental study of a Diffraction Radiation Oscillator (DRO) is reported. The sphere-cylindrical open cavity used in the DRO has been analyzed, the method for testing the field profile and the cold measurement of the open cavity have been worked out. The experimental device was manufactured in the authors' laboratory, and the theoretical analysis and experimental study of the device have been carried out. The main experimental results are: from 2000 V to 4000 V, the tube operates in the 60-87 GHz band, and the maximum output power is about 800 mW. (Edited author abstract) 12 refs.

## Spectrum Analysis

**075477 ELECTROSTATIC CALIBRATION OF MECHANICAL OSCILLATORS.** An accurate calibration method for mechanical oscillators is proposed that can measure small forces and moments yet does not require a measurement of geometrical parameters on the calibrating capacitor. The method depends on a mechanical oscillator with a sufficiently high quality factor and the fact that the charged calibrating capacitor introduces negative stiffness in the oscillatory system. 5 refs.

Maksimov, V.N. *Meas Tech* v 30 n 5 May 1987 p 497-500.

**075478 COMPARATIVE ANALYSIS OF NATURAL FLUCTUATIONS IN TWO CLASSES OF SELF-EXCITED OSCILLATORY SYSTEMS.** Using the spectral-time method a comparative analysis is made of the natural fluctuations in the amplitude and phase of self-excited oscillatory systems of the Thomson type and of self-excited oscillatory systems with delay. A system of stochastic differential equations describing the fluctuation motion of the spectral components of the stationary process is set up. Analytic expressions for determining the intensities of fluctuations in amplitude, and phase and their cross correlation are obtained. Results of an analysis of the fluctuations as of function of the relative delay time are presented. (Author abstract) 11 refs.

**075481 SYSTEM OF 2N SELF-EXCITED OSCILLATORS WITH TWO TYPES OF RESISTIVE COUPLING.** The conditions for local stability of synchronous oscillations in a system of two ensembles of self-excited oscillators, in which two types of resistive coupling that are opposite in their action exist between the self-excited oscillators, are examined. An approach, which represents the stability problem as an eigenvalue problem, is used in the analysis. (Author abstract). 6 Refs.

Novikov, S.S.; Maydanovskiy, A.S. *Sov J Commun Technol Electron* v 32 n 10 Oct 1987 p 158-162.

**075482 STABILITY AND DISTORTION IN TUNEABLE LOW FREQUENCY SINUSOIDAL OSCILLATORS.** The theoretical principles involved in the design of tuneable oscillators are presented in the context of a practical design which generates a sinusoidal output with a constant amplitude and low harmonic content over the range 7-2500 Hz in three overlapping bands, each with a continuous tuning range exceeding 20:1. We introduce a figure of merit  $\zeta$ , the product of the fractional amplitude variation on tuning and the fractional harmonic content, and show that  $\zeta = \lambda \delta L / L$  where  $L$  is the insertion loss at the resonant frequency  $\omega$ , (essentially  $L = Q^{-1}$ ) of the frequency selective element,  $\delta L / L$  its fractional variation on tuning and  $\lambda$  is a constant depending on the structure of the oscillator and of the amplitude control system. When a subsidiary low-pass control loop characterized by a time constant  $T$ , which influences the settling time, is used,  $\lambda$  is inversely proportional to  $\omega_0 T$ . (Author abstract). 5 Refs.

## Synchronization

**075483 OSCILLATOR SYNCHRONIZATION POWER AS A FUNCTION OF REGENERATION IN BIAS CIRCUITS.** Investigation of synchronization processes in self-excited oscillators with allowance for bias-circuit parameters is of scientific and practical interest. In the literature the energy characteristics of the synchronizing signal are considered with no allowance for this influence. In systems designed on the basis of devices having natural negative resistance (tunnel diodes (TD) or Gunn diodes (GD)), this influence may be substantial, however, owing to regeneration in the bias circuit. We examine the influence of regeneration qualitatively for the example of a TD oscillator. 3 Refs.

Grunenkov, A.A.; Zubov, P.T.; Khotuntsev, Yu.L. *Radiotekhnika i Elektronika* v 30 n 10 1987 p 76-79.

## Synthesis

**075484 SYNTHESIS OF ACTIVE-R OSCILLATORS WITH ADDITIONAL NOTES ON PARTIALLY ACTIVE-R APPLICATIONS.** General oscillation requirements for two operational amplifier active-R circuit implementations are stated. A procedure for minimizing oscillation frequency sensitivities is described. Many oscillator realizations are also derived. The steps for finding partially active-R oscillator circuits are shortly outlined. It has been shown that especially in IC-technology non-minimum sensitivity oscillator structures may be preferable. (Author abstract) 11 Refs.

Valtonen, Pekka (Tampere Univ of Technology, Tampere, Finl). *AEU Arch Elektron Uebertrag Electron Commun* v 41 n 6 Nov-Dec 1987 p 325-329.

## Testing

**075485 ANALYTICAL AND EXPERIMENTAL STUDY OF INJECTION-LOCKED TWO-PORT OSCILLATORS.** A Ku-band IMPATT oscillator with two distinct output power ports was injection-locked alternately at both ports. The transmission locking bandwidth was nearly the same for either port. The lower free running power port had a reflection locking bandwidth that was narrower than its transmission locking one. Just the opposite was found at the other port. A detailed analytical model for two-port injection-locked oscillators is presented, and its results agree quite well with the experiments. A detailed critique of the existing literature on this topic is included. It is concluded that two-port injection-locked oscillators may prove useful in certain communication systems. (Edited author abstract) 14 Refs.

## Transients

**075486 NUMERICAL METHOD FOR ANALYZING TRANSIENT AND STEADY STATES OF SINE WAVE OSCILLATOR CIRCUIT WITH STIFFNESS.** This paper proposes a method for analyzing the transient and steady states of a sine wave oscillator circuit with reactive elements which have large differences in their values. The circuit equation is represented by an autonomous nonlinear differential equation with the values of these elements. First, we describe the method for solving numerically the differential equation regardless of the stiffness by the asymptotic method developed by Krylov, Bogolyubov and Mitropolskiy. Second, we present the method for obtaining solutions of the differential equation with regard to the stiffness by combining the asymptotic method with numerical integration. (Edited author abstract) 9 Refs.

Okumura, Kohshi (Kyoto Univ, Kyoto, Jpn); Kishima, Akira; Yasuda, Hisashi. *Electron Commun Jpn Part 1* v 70 n 10 Oct 1987 p 1-11.

**075487 AMPLITUDE TRANSIENTS IN THE TWIN-T BRIDGE RC-OSCILLATOR WITH A MULTIPLIER AMPLITUDE CONTROL SYSTEM.** This paper considers the amplitude transients in the twin-T bridge RC-oscillator with an amplitude control system employing multipliers. The application of such a control system is feasible because this oscillator has two nodes where the sinusoidal steady-state voltages are shifted by 90°. The voltages at these nodes are squared and summed and the resulting dc voltage is compared with the reference voltage. The difference is amplified and is applied to the voltage control resistor (VCR) which is able to control the displacement of the poles on  $j\omega$  axis. Restricting ourselves to the case of step modulation of the reference voltage we obtain the solution for the amplitude transients in a closed form. This result is obtained without recurring to the linearization of the transfer function relating the oscillator output to the displacement of the above-mentioned  $j\omega$  axis poles. The effect of a loop filter for further reducing total harmonic distortions (THD) in a practical oscillator is analyzed. The nonlinearity of the VCR realized with a (FET) is taken into consideration by the piece-wise linearization of the FET control characteristic. All calculations were verified experimentally. (Author abstract) 19 Refs.

## Variable Frequency

**075488 ISOCHRONIZATION OF PENDULUM OSCILLATORS.** The problem of securing isochronism in pendulum-type oscillatory systems retains its interest when designing single-harmonic systems of measuring

technology. An outline is given of the design criteria for oscillatory devices that have multiple-fiber suspensions for checking angular accelerometers or moments of inertia of bodies. 4 Refs.

Smirnov, V.N. *Meas Tech* v 30 n 5 May 1987 p 438-441.

## Vibrations

**075489 PRESSURE DEPENDENT DYNAMIC CHARACTERISTICS OF MINIATURE SILICON OSCILLATOR.** The theoretical analysis of the dynamic behavior of a miniature silicon oscillator consisting of a cantilever beam and a rectangular paddle was presented. The calculated results are in good agreement with the experimental data. Within the range of  $10^{-1}$  to  $10^5$  Pa, the dynamic characteristics of the oscillator are seen to depend on the air pressure. The effects of the air damping force acting on the miniature oscillator can be explained by the kinetic theory of gases in the lower pressure region. In the lower pressure region, vibrational amplitude increases with decreasing air pressure, but saturates at a critical pressure. In the higher pressure region, the air damping force increases in proportion to the acceleration, as well as in proportion to the velocity of the paddle tip. 5 Refs.

## OSCILLATORS, CRYSTAL See Also RESONATORS, CRYSTAL.

**075490 PACKAGED FREQUENCY SOURCES USING SPECIALISED PRECISION CRYSTALS.** High precision frequency sources are readily accessible due to the availability of quartz crystals. Frequencies can be measured and generated to accuracies many order of magnitude better than 50 ppm. The available packages range from the SPXO through TCXO (temperature compensated crystal oscillator), OXCO (oven controlled crystal oscillator) to miniature atomic standards able to generate frequency reliably to a precision of  $1 \times 10^{-11}$  in a package only a few centimeters in each dimension. The paper discusses the undesirable crystal characteristics, such as aging and susceptibility to mechanical and thermal stresses, and the measures to be taken to overcome these properties.

Heaviside, John (HCD Research). *New Electron* v 20 n 19 Sep 29 1987 p 39-42.

**075491 QUARTZ CRYSTAL UNITS FOR TEMPERATURE COMPENSATED CRYSTAL OSCILLATORS.** Quartz crystal units in the frequency range of 2.48 MHz to 5.0 MHz were designed and fabricated for use in Temperature Compensated Crystal Oscillators (TCXOs). Their dynamic and state behavior of frequency and resistance with respect to temperature changes from  $-45^\circ\text{C}$  to  $+85^\circ\text{C}$  were studied. The geometry of the resonator namely, the resonator diameter, planoconvex contour, electrode thickness and size were properly selected to make them free from activity dips and frequency discontinuities in the desired temperature range. The resonator quality factor [Q] was estimated with different amount of etching in  $\text{NH}_4\text{HF}_2$  solution and an optimum level of etch was determined. (Edited author abstract) 8 Refs.

## Design

**075492 DESIGN OF CRYSTAL OSCILLATORS WITH FUNDAMENTAL FREQUENCIES IN THE UHF AND MICROWAVE REGIONS.** A negative resistance approach is used to design a crystal oscillator

whose fundamental resonance is at  $F_0 = 842.911$  MHz. The SSB phase noise measurements of the crystal oscillator show great potential for the development of stable frequency sources in the UHF and microwave regions. (Author abstract) 4 refs.

Gonzalez, G. (Univ of Miami, Coral Gables, FL, USA); Avanic, B. *Electron Lett* v 23 n 25 Dec 3 1987 p 1379-1381.

**075493 DESIGN METHOD YIELDS LOW-NOISE, WIDE-RANGE CRYSTAL OSCILLATORS.** A characterization technique allows you to design frequency-determining networks for tunable crystal oscillators. The method yields oscillators that provide a wide tuning range and exhibit low-noise performance. The design methodology accurately quantifies all effects relevant to oscillator performance. (Author abstract)

Hillstrom, Tim L. (Hewlett-Packard Co). *EDN* v 33 n 6 Mar 17 1988 p 141-144, 146.

**075494 RUBIDIUM-CRYSTAL OSCILLATOR (RBXO).** The rubidium-crystal oscillator (RBXO) is a voltage-controlled crystal oscillator (VCXO) that is periodically synchronized by a rubidium (Rb) reference. The RBXO uses a digital tuning memory to hold the VCXO frequency-control voltage while the Rb reference is off. The RBXO design and test results are described, including a 180-day design verification test, during which four RBXOs were cycled on and off 20 times/day while being subjected to a -62-to-+68°C temperature cycle. This test successfully verified that the design is capable of the desired 20-year life. Of particular interest is the low synchronization energy (2 Wh at +25°C) and low drift of the synchronized frequency ( $< 5 \times 10^{-13}$ /day) during many thousands of on-off cycles. The long-term stability of the RBXO is essentially identical to that of the rubidium frequency standard operating continuously. 5 refs.

## Electric Field Effects

**075495 EFFECTS OF AN APPLIED FIELD ON THE STEADY STATE CHARACTERISTICS OF A UNIDIRECTIONAL PHOTOREFRACTIVE RING OSCILLATOR.** Steady state oscillation in a unidirectional photorefractive ring oscillator is examined in the presence of a dc electric field. For small applied field strengths, there is a shift in the origin of the linear curve for the frequency difference between the oscillating field and the pump beam versus the cavity detuning. Consequently, the resonator field oscillates at a different frequency from the pump beam, even when the cavity is tuned to exact resonance. This frequency difference is determined by the dc electric field and the characteristic fields of the photorefractive medium. For large applied fields, the frequency difference becomes an asymmetric function of the cavity detuning due to the dominance of the drift motion of the liberated charge carriers in one preferred direction. The range of cavity detuning over which oscillation will occur for a given set of parameters is enhanced when large electric fields are applied to the photorefractive medium; this effect may best be observed in resonators with high finesse. (Edited author abstract) 17 refs.

## Quartz Applications

**075496 HIGH-PERFORMANCE CRYSTAL OSCILLATOR CIRCUITS: THEORY AND APPLICATION.** A general theory that allows the accurate linear and nonlinear analysis of any crystal oscillator circuit is presented. It is based on the high Q of the resonator and on a very few nonlimiting assumptions. The special case of the three-point oscillator, that includes Pierce and one-pin circuits, is analyzed in more detail. A clear insight into the linear behavior, including the effect of losses, is

obtained by means of the circular locus of the circuit impedance. A basic condition for oscillation and simple analytic expressions are derived in the lossless case for frequency pulling, critical transconductance, and start-up time constant. The effects of nonlinearities on amplitude and on frequency stability are analyzed. As an application, a 2-MHz CMOS oscillator which uses amplitude stabilization to minimize power consumption and to eliminate the effects of nonlinearities on frequency is described. The chip, implemented in a 3- $\mu$ m p-well low-voltage process, includes a three-stage frequency divider and consumes 0.9  $\mu$ A at 1.5 V. The measured frequency stability is 0.05 ppm/V in the range 1.1-5 V of supply voltage. Temperature effect on the circuit itself is less than 0.1 ppm from -10 to +60°C. 28 refs.

## Stability

**075497 FREQUENCY STABILITY OF EMITTER FOLLOWER TYPE CRYSTAL OSCILLATORS.** Adjustment-free crystal oscillators with only a few circuit elements are used widely since they are suited for ICs. The simplest emitter-follower-type crystal oscillator made of a transistor, a quartz crystal, a capacitor, and three resistors is studied in terms of its frequency stability. It is found that the oscillation frequency is more stable against the change of an external capacitance if larger values are chosen for the collector capacitance  $C_c$ , the grounded base current gain  $\alpha$ , and the cutoff frequency  $f_c$ . Against the change of the power supply voltage, the optimum value of  $f_c$  can be determined after  $C_c$  is selected from the forementioned condition. The oscillation frequency deviation is smaller for a larger equivalent inductance regardless of the Q value of the crystal. Based on these results, it is found that the improvement is more than sixfold against the variation of the power supply voltage, and more than elevenfold against that of the circuit capacitance. (Edited author abstract)

Nakamura, Kohei (Nihon Univ, Narashino, Jpn). *Electron Commun Jpn Part 2* v 71 n 1 Jan 1988 p 32-40.

## Thermal Effects

**075498 300-MHZ DIGITALLY COMPENSATED SAW OSCILLATOR.** A method for compensating for the inherent temperature sensitivity of surface-acoustic-wave (SAW) oscillators is described. Results for a 300-MHz digitally compensated SAW oscillator (DCSO) show a reduction of temperature-induced frequency variation from  $\pm 125$  parts per million to  $\pm 1.4$  parts per million over the temperature range of -23 to 75°C. This is accomplished using simple digital circuitry and microprocessor control. The temperature-sensing scheme, using a SAW structure with two delay paths of different temperature sensitivity on the same AT-cut quartz substrate, virtually eliminates thermal resistance and time-constant problems. Advantages over ovenized systems include fast warmup; reduced size, weight, and power dissipation; low cost potential; and the ability to compensate for other sources of frequency drift. 20 refs.

## OSCILLATORS, GUNN

**075500 AM-PM CONVERSION IN AN X-BAND INJECTION-LOCKED GUNN OSCILLATOR.** The paper presents a systematic analysis of the AM-to-PM conversion performance of an X-Band Gunn Oscillator injection-locked to an AM signal. The analysis shows that with a proper choice of the system parameters, it is possible to obtain a complete conversion of the amplitude modulation of a given carrier into the phase modulation of the same carrier with the least possible modulation-distortion. (Edited author abstract) 12 refs.

Chattopadhyay, Taraprasad (Burdwan Univ, Burdwan, India). *J Inst Electron Telecommun Eng* v 33 n 2 Mar-Apr 1987 p 52-57.

**075501 EFFICIENT FM-AM CONVERSION THROUGH INJECTION-LOCKING OF AN X-BAND GUNN OSCILLATOR.** This paper describes experimental observations on the amplitude modulation of a 9.347 GHz Gunn oscillator when it is injection-locked by an FM signal. The dependence of both the FM-AM conversion efficiency and the harmonic distortion of the detected signal on the system parameters is discussed in detail. Numerical analysis for the system is also presented. The investigations carried out indicate that an injection-synchronized microwave oscillator can be used as an efficient FM-AM converter so that together with an AM detector, it can serve the purpose of a faithful FM demodulator, especially for low-index FM signals. (Author abstract) 14 refs.

Chattopadhyay, T.P. (Burdwan Univ, Burdwan, India). *J Inst Electron Telecommun Eng* v 32 n 6 Nov-Dec 1986 p 428-434.

**075502 SECOND HARMONIC OPERATION OF X-BAND GUNN DEVICES.** GaAs Gunn devices are being increasingly used in the harmonic mode to deliver appreciable power in the mm-wave band. In this paper, the second harmonic response of indigenously developed X-band Gunn devices are treated. The circuit requirements and experimental results obtained in a conventional resonant disc type oscillator circuit are discussed in detail. (Author abstract) 10 refs.

**075503 PROPER BIAS CUTS NOISE, SELECTS FREQUENCY.** Part 1 of this article covered Gunn diode and oscillator fundamentals, and the basic design concepts and temperature-compensation methods of a cavity oscillator. This part advances the study by analyzing problems in starting the oscillations at low temperatures and maintaining power stability at all temperatures. It also covers noise performance and frequency tuning in the Gunn oscillator. 3 refs.

## Analysis

**075504 AUTODYNE DETECTION EFFECT IN GUNN-DIODE OSCILLATORS AND ITS UTILIZATION FOR MONITORING THE THICKNESS AND DIELECTRIC CONSTANT OF MATERIALS.** We use a numerical analysis as the basis for describing the autodyne detection effect in oscillators using Gunn diodes and to investigate the features of its utilization for checking the parameters of materials. The calculations, carried out for the actual parameters of the active element and load, make it possible to evaluate the magnitude of a detected signal, to determine the region of values of

monitored material parameters in which the sensitivity of the autodyne to variation is greatest, and to indicate ways of optimizing the oscillator design. 5 Refs.

Usanov, D.A.; Skripal, A.V. *Radioelectron Commun Syst* v 30 n 10 1987 p 80-82.

**075505 VARACTOR-TUNED GUNN-DIODE OSCILLATOR.** It is possible to tune Gunn-diode oscillators electrically by means of bias voltage, by utilization of p-i-n diodes, with utilization of a YIG sphere, and by means of a varactor. Oscillators controlled in accordance with the frequency of a resonator with yttrium iron garnet ferrite have good linearity (better than 1% in the centimeter band) but have a low rate of tuning; oscillators tuned by means of varactors, which have a high rate of tuning, most frequently are provided with good linearity by utilization of special measures. The required linearity of an oscillator modulation characteristic, the dependence of the oscillation frequency on the control voltage, is determined for generation of signals with linear frequency modulation (LFM). It is pointed out that such signals improve the information level of radio systems, for example, the range and velocity resolving power of a radar system. 4 Refs.

## Design

**075506 DESIGN AND FABRICATION OF A 35 GHz, 100 mW LOW PHASE NOISE GUNN DIODE OSCILLATOR.** A low phase noise of between  $-125$  and  $-132$  dBc/Hz is obtained for a 35 GHz, 100 mW Gunn diode oscillator using the van der Hyden approach. This low phase noise was accomplished by making the coupling between the terminated coaxial line Gunn diode oscillator and the stabilizing cavity resonator as large as possible, while making the coupling to the output as weak as practical for sufficient measurement of output power. The design data and test results for the oscillator are given. 13 Refs.

Strangeway, Robert A. (Marquette Univ, Milwaukee, WI, USA); Ishii, T. Koryu; Hyde, James S. *Microwave J* v 31 n 7 Jul 1988 p 107-112.

**075507 LOW-PHASE-NOISE GUNN DIODE OSCILLATOR DESIGN.** Low-phase-noise Gunn diode oscillators with an operating frequency of 35 GHz and an output power of 100 mW are designed, fabricated, and tested. The phase noise is  $-132$  dBc/Hz to  $-125$  dBc/Hz at 100-kHz offset from the center frequency. This low phase noise is obtained by closely coupling the stabilizing transmission cavity resonator and the Gunn-diode-oscillator coaxial line while loosely coupling the transmission cavity to the output waveguide following van der Heyden's approach. 13 Refs.

## Millimeter Waves

**075508 EFFECT OF A HIGH ENERGY INJECTION ON THE PERFORMANCE OF MM WAVE GUNN OSCILLATORS.** The 'dead zone' existing in conventional  $n^{+}nn^{+}$  GaAs Gunn diodes was eliminated by the addition of a cathode structure which launches electrons into the active region at nearly the energy required for interval transfer. The experimental efficiency and output power from devices made with the launcher were up to three times higher at 80-100 GHz than from conventional  $n^{+}nn^{+}$  devices designed for these frequencies. The launcher was realized by the energy discontinuity at the interface of a  $n$ -AlGaAs/ $n$ -GaAs heterojunction, where the transport is perpendicular to the interface. (Author abstract) 9 Refs.

## Stability

**075509 MODE STABILITY OF RADIATION-COUPLED INTERINJECTION-LOCKED OSCILLATORS FOR INTEGRATED PHASED ARRAYS.** An analysis is presented of a two-element, 10-GHz array consisting of two oscillators coupled solely by means of the free-space interaction between their respective antenna elements. The oscillators are modeled as energy-storing L-C tank circuits in parallel with voltage-dependent negative conductances. A simplified far-field slot antenna model is used to derive the mutual admittance of the two antennas. Even-odd mode analysis yields the normal modes of the system, and a theorem from averaged potential theory is used to determine which mode is stable. Two microstrip Gunn diode oscillators were built to verify the essential features of the model. Oscillator frequencies, relative phases, and radiation patterns were measured as functions of the interantenna distance, and the periodic alternation of modes with distance predicted by theory was confirmed quite well. 7 Refs.

Testing See SEMICONDUCTOR DIODES, GUNN—Testing.

**OSCILLATORS, MICROWAVE** See Also LASERS, FREE ELECTRON—Microwaves; MICROWAVE DEVICES, Military Applications; OSCILLATORS, CRYSTAL—Design; OSCILLATORS, GUNN; RESONATORS, CAVITY; TRANSISTORS, FIELD EFFECT—Efficiency.

**075510 MODE JUMPING AND PHASE LOCKING IN IMPATT OSCILLATORS.** The effect of package parasitics on the behavior of an IMPATT diode oscillator whether it is in a free-running or in injection-synchronized state is studied in detail. Appearance of mode jumping phenomenon in such oscillators, hitherto unknown, has been critically examined and how to get rid of this phenomenon has been predicted. Computer simulation results have been presented to corroborate the theoretical findings. (Author abstract) 3 Refs.

Biswas, B.N.; Chatterjee, S.; Sarkar, S.; Bhattacharya, A.K. *J Inst Electron Telecommun Eng* v 33 n 1 Jan-Feb 1987 p 16-22.

**075511 HIGH-POWER MICROWAVE EMISSION FROM A VIRTUAL CATHODE OSCILLATOR.** Pinched electron beams emit high power microwaves by formation of a virtual cathode. Radiation occurs simultaneously with pinching or slightly thereafter. Observations of strong electrostatic fields and the partitioning of current into reflexing and transmitting populations at the same time that microwaves are emitted indicate virtual cathode formation. Microwaves originate mainly from the virtual cathode side of the anode. A two-dimensional model for the electron flow in the presence of a virtual cathode is presented. The model allows for electron reflexing and velocity distribution spread. Solutions with strong radial flow agree closely with microwave measurements, and result in the microwave frequency scaling linearly with diode current. (Author abstract) Refs.

**075512 SELF-CONSISTENT FIELD THEORY AND CALCULATION FOR GYROMOTRON.** A self consistent field large signal theory of gyromotron is studied in this paper. The rf field profile function satisfies a wave equation. The field is determined by cavity geometry and ac electron beam current. The rf field not only satisfies the boundary conditions at the ends of the cavity but also obeys conservation of energy for steady state interaction between electron beam and field. The parameters of a particular gyrotron are calculated numerically using present theory. Effect of some factors on gyrotron characteristic is discussed. Comparison is made between the results of the self consistent field calculations

with and without conservation of energy. (Author abstract) 7 Refs.

**075513 TWO-SPHERE YIG MULTIPLIER/FILTER ENSURES PURITY.** Frequency multiplication is an economical and time-proven technique for generating microwave outputs from low-frequency inputs. However, inherent in this technique is the generation of both desired and unwanted harmonics. A new, two-sphere YIG-tuned multiplier/filter guarantees spectral purity of better than  $-50$  dBc in harmonics and subharmonics over a 2-to-20-GHz frequency range. (Author abstract) 4 Refs.

Rhymes, Lynn (Hewlett-Packard Co, Santa Rosa, CA, USA). *Microwaves RF* v 27 n 4 Apr 1988 5p between p 109 and 116.

**075514 SYNCHRONOUS AND STOCHASTIC SELF-EXCITED OSCILLATIONS IN A TRANSISTOR MICROWAVE OSCILLATOR WITH DELAYED FEEDBACK, SUBJECTED TO THE PARAMETRIC ACTION OF AN EXTERNAL FORCE.** Results of an experimental investigation of nonautonomous operating modes of a transistor microwave oscillator with delay are presented. It is shown that random oscillations can be stimulated parametrically by applying an external signal, and processes of derandomization are examined. Randomization and derandomization processes are studied in a mathematical model of a nonautonomous multimodal system. (Author abstract) 12 Refs.

Kal'yanov, E.V. *Sov J Commun Technol Electron* v 32 n 8 Aug 1987 p 131-137.

**075515 OPERATION OF CUSPTRON AT FUNDAMENTAL AND HARMONIC CYCLOTRON FREQUENCIES.** The authors report microwave radiation at the fundamental and harmonic electron cyclotron frequencies generated by a cusptron oscillator. A low-energy, axis-rotating beam of 28-30 kV, 0.8-3.5 A, 4  $\mu$ s, and 60 pps interacts with a single RF mode, both in a circular cavity and in a six-vane circuit by the negative mass instability. In fundamental and second-harmonic frequency generation with a circular circuit, the independently excited modes are  $TE_{11s}$  and  $TE_{21s}$  with radiation power of more than 1.8 kW and an electronic efficiency of approximately 7.5%. Employing a six-vane circuit, microwave radiation of 6.0 GHz (sixth harmonic) and 3.9 GHz (fourth harmonic) is also independently generated with more than 10.4 and 4.0 kW, respectively. Corresponding electronic efficiencies are approximately 10.0 and 9.5%. 12 Refs.

## Analysis

**075516 COUPLING COEFFICIENTS AND INJECTION-LOCKING CHARACTERISTICS OF MICROWAVE OSCILLATORS.** Injection-locking phenomena are often studied for the purpose of application to synchronous operation and parallel operation of multiple oscillators. With respect to the coupling of multiple oscillators, synchronization stability, mode control and long-time effects are problems. It is pointed out that the difference in the locking characteristics at low frequencies and at microwave frequencies is caused by treatment of the incident signal as the voltage and current or as the traveling wave. It is shown that use of the wave concept is more practical and rational in the microwave region. In such cases, the strength of the coupling between oscillators should be considered in two separate aspects: magnitude of the coupling ( $C \geq$  or  $\leq 1$ ) between the oscillator and the coupling transmission line, and coupling efficient  $r$  of the oscillator coupling circuit. As a result, it is found that a symmetric coupling with a rather weak coupling factor ( $r < 1$ ) or, if coupling is strong, an asymmetric

coupling is desirable for power combining of Van der Pol oscillators. (Edited author abstract) 10 refs.

**075518 CONDITIONS FOR THE APPEARANCE OF MULTIFREQUENCY GENERATION IN A DISTRIBUTED RESONANT SELF-EXCITED BACKWARD-WAVE SYSTEM.** The physics of processes leading, in a resonance backward-wave self-excited oscillator with an extended electron beam, to the appearance of multifrequency oscillations and concomitant hysteresis phenomena is studied. The analysis is limited to stationary states. It is shown that a number of stationary generation states can exist at frequencies close to the resonance frequencies of the electrodynamic system, a transition between the stationary states can occur, accompanied by hysteresis of the amplitude and frequency characteristics, and both single-frequency and multifrequency generation of oscillations can be realized. The results of the theory are confirmed by experiments. (Edited author abstract). 8 Refs.

**075519 THEORY OF HIGH-HARMONIC GYROTRON OSCILLATORS WITH SLOTTED CROSS-SECTION STRUCTURE.** A linear-theory analysis of gyrotron oscillators with slotted cross section is used to calculate the net change in beam energy. In this formalism, geometric factors are clearly distinguished from the geometry-independent harmonic resonance terms due to the fundamental electron cyclotron maser and peniotron interactions. This separation of the interaction terms from the geometric factors simplifies the physical analysis, and leads to a very compact form for the net change in beam energy. The theory is applied to slotted rectangular oscillators and to slotted cylindrical oscillators to show that a unified expression can be obtained for the start-oscillation condition. In sample applications of the theory, it is demonstrated that slots lower the start-oscillation condition in both cylindrical and rectangular geometries, and can lead to a decrease in this condition as harmonic number is increased in the rectangular geometry. It is also found that the peniotron interaction, which is easily identified in this formalism, may be very strong in slotted cavities. 25 refs.

**075520 CUBIC DISPERSION RELATION FOR A RELATIVISTIC BACKWARD-WAVE OSCILLATOR.** The cubic approximation to the dispersion relation for a relativistic backward-wave oscillator is obtained, and the utility and limits of the approximation are presented. The approximation is obtained by Taylor series expansion of the wave admittance in the dispersion relation for the transverse-magnetic and free-streaming modes of a relativistic, thin, hollow, cylindrical electron beam moving along the axis of a disc-loaded waveguide in a strong axial magnetic field. The resulting cubic dispersion relation yields instability growth rates and frequencies which fall off beyond their maximum more sharply with increasing wavenumber than for the complete dispersion relation. The approximation is found to be quite good near the operating points of contemporary high-power relativistic backward-wave oscillators, namely, for relatively long

wavelength and small ratio of Budker's parameter to the relativistic gamma factor of the beam. 4 refs.

**Applications** See Also SPECTRUM ANALYZERS—Components.

**075521 MAGNETICALLY TUNED MICROWAVE OSCILLATOR USING THE YIG FILM AND ITS APPLICATIONS.** Based on the fact that the magneto-static mode in a YIG thin film depends on the direction of a dc magnetic field, a frequency-controllable oscillator is proposed. First, the dispersion and delay characteristics are analyzed theoretically for the magnetostatic wave in a YIG thin film magnetized in an arbitrary angle. Next, on both sides of a YIG thin film with a thickness of 13.6  $\mu\text{m}$  and a size of  $5 \times 15 \text{ mm}^2$ , ten metal strips are evaporated at a pitch of 1 mm. The filtering characteristics of this Bragg reflection reflection filter are then evaluated. Subsequently, this filter and an FET amplifier are combined to form an oscillator for 2 to 4 GHz. Measured results for the oscillation characteristics, output power and spectrum for different magnetic field directions are compared with theoretical results. Finally, as an application of this oscillator, a correlator is proposed and its operation is explained. (Edited author abstract). 8 Refs.

**075522 PC PROGRAM CUTS OSCILLATOR DESIGN TIME.** Even at UHF frequencies, oscillator design is a trial-and-error process. Using a standard 'cookbook' model, the components are scaled to the desired values, and optimization is achieved by tuning the circuit. This requires hours of manual labor. The alternative method described in this article uses a negative-resistance model and a FORTRAN program for MS-DOS computers to accurately predict the performance of UHF oscillators. This program can dramatically reduce the time necessary to design and optimize these components. (Edited author abstract) 3 refs.

**Design** See Also INTEGRATED CIRCUITS, MONOLITHIC—Design.

**075523 DEVELOPMENT OF A COMPACT, HIGHLY RELIABLE Rb-3100 RUBIDIUM ATOMIC OSCILLATOR.** Rubidium atomic oscillator (Rb OSC), that is physically compact and exhibits excellent frequency stability, has become available for various applications as a secondary frequency standard. Compared to XL OSC, Rb OSC is more complex in construction and more expensive. Also, Rb OSC generally is dependent on the lifetime of the optical device, particularly Rb lamp. However, NEC has succeeded in developing a compact Rb OSC called the Rb-3100 oscillator. Along with the excellent frequency stability displayed by this oscillator, it is both reliable and durable enough to be used in various commercial applications. The MTBF of the Rb-3100 has been doubled, and the resistance to vibration and shock has been increased by 20 times as compared with NEC's conventional Rb OSC. Furthermore, the size of the Rb-3100 has been reduced to 1/8 and the cost has been reduced to 1/2 that of the conventional Rb OSC. (Edited author abstract) 3 refs.

**075524 PRINCIPLES OF THE DESIGN OF OPTIMIZED BIPOLAR TRANSISTOR MICROWAVE SELF-EXCITED OSCILLATORS.** A system of three nonlinear algebraic equations are obtained, which describe the stationary mode of operation of a microwave transis-

tor self-excited oscillator, taking into account the actual nonlinearities of the current-voltage and charge-voltage characteristics of the bipolar transistor, the effect of automatic bias, and the mutual nonlinear effect of the input and output circuits. Optimization is carried out by the local method of direct search (rotating coordinates). The theoretical and experimental data for self-excited oscillators based on the 2T634A-2 and 2T640A-2 transistors, designed at frequencies of 4 GHz and 6.5 GHz, are found to be in satisfactory agreement, and methods for optimizing the circuit and constructional parameters to obtain maximum power into the useful load are determined. (Author abstract) 10 refs.

**075525 OCTAVE BANDWIDTH VARACTOR-TUNED OSCILLATORS.** This paper describes the design of a new range of voltage-controlled oscillators covering octave bandwidths between 6 and 18 GHz. These oscillators are varactor-tuned and, as such, are inherently faster tuning and more efficient than YIG-tuned oscillators; the other advantages of the new VCOs are small size and low weight. These oscillators use a single control voltage for the tuning even though they use two varactors. 2 refs.

**075526 15.6 GHz HBT MICROSTRIP OSCILLATOR.** This letter describes the design and performance of a Ku-band HBT oscillator. The circuit was implemented in microstrip on an alumina substrate. The device used was a fully self-aligned AlGaAs/GaAs HBT using side wall technology. An output power of +6.5 dbm was achieved at 15.6 GHz with a collector efficiency of 11%. The phase noise was -60 dbc/Hz at 10 kHz offset, which is comparable to that of a silicon bipolar oscillator, and 20 dB less than that for a GaAs FET oscillator at the same frequency band. (Edited author abstract) 6 refs.

**075527 MICROWAVE SOURCES FOR DIGITAL RADIO.** Digital radio applications represent a rapidly growing area in communications technology. A key component in digital radio system design is the microwave local oscillator, which is used to up- and down-convert the digital signal. Important considerations in the design of these sources are performance criteria, frequency stabilization and mechanical requirements. Some test methods and two examples of digital radio local oscillators are discussed. (Author abstract) 3 refs.

**075528 GENERALIZED APPROACH TO THE DESIGN OF MICROWAVE OSCILLATORS.** A generalized two-port method for the design of microwave oscillators and the associated theory are proposed. The method overcomes the difficulties associated with one-port techniques, where the passive elements connected to the active device to obtain a negative-impedance one-port are often chosen empirically, constraining the design and sometimes making the prespecification of parameters impossible. Using the proposed method, both frequency and power output can be predicted. The main feature of this technique is that it allows the optimum performance to be obtained from the active device. This is achieved by means of a generalized substitution theorem, which is described and mathematically proven. A design example and experimental results are given for a 12-GHz MESFET oscillator. The experimental results were found

to be within 9% of the predicted values for both frequency and power, without any experimental adjustment. 24 refs.

## Efficiency

**075530 HIGH-PEAK POWER  $K_A$ -BAND GYROTRON OSCILLATOR EXPERIMENTS WITH SLOTTED AND UNSLOTTED CAVITIES.** A  $K_A$ -band gyrotron oscillator powered by a compact pulsed-line accelerator has been operated using oscillator cavities with and without axial slots. The oscillator was operated at high voltage (approx. 900 keV) and high current (approx. 500 A) in the approximate frequency range of 20-50 GHz. The use of axial slots has been shown to suppress low-starting-current whispering-gallery modes, in particular, modes of the  $TE_{m2}$  type, allowing stable operation in a linearly polarized  $TE_{13}$  mode. A peak power of 35 MW has been observed at 6% efficiency. 11 refs.

Gold, S.H. (US Naval Research Lab, Washington, DC, USA); Filiflet, A.W.; Manheimer, W.M.; McCowan, R.B.; Lee, R.C.; Granatstein, V.L.; Hardesty, D.L.; Kinkad, A.K.; Suci, M. *IEEE Trans Plasma Sci* v 16 n 2 Apr 1988 p 142-148.

## Fabrication

**075531 70 GHz INTEGRATED SILICON OSCILLATOR.** Planar oscillators on highly insulating silicon substrate with a disc resonator were fabricated. The active element was an IMPATT diode made from Si MBE material. A maximum cw output power of 200 mw with an efficiency of 4.5 percent at 73 GHz has been obtained. (Author abstract). 7 Refs.

## Millimeter Waves

**075532 OSCILLATOR PRIMING AND PREOSCILLATION NOISE IN A GYROTRON.** Phase control is achieved in a pulsed gyrotron oscillator both by applying an external priming signal directly to the oscillator and by applying the signal to a prebunching cavity. A pulse-to-pulse phase jitter of greater than  $2.5^\circ$  is achieved in the gyrotron at drive-to-oscillator power ratios of  $-36.6$  dB (drive signal-to-noise power ratio of 36 dB) in the direct injection case and  $-71$  dB (drive signal-to-noise power ratio of 22 dB) in the prebunched case. A lumped-element theory is compared to the experimental results. The theoretical description seems valid when the drive frequency is within about 5 MHz of that of the oscillator. Preoscillation noise in the gyrotron is about 10  $\mu$ W, larger than expected from either shot noise or thermal noise but in the vicinity of spontaneous cyclotron emission. Convective radio-frequency noise growth is investigated. No evidence of the electrostatic cyclotron

instability was seen. All growth observed is attributed to the gyrokystron amplification mechanism. However the noise growth per unit length is not as large as that of a narrow-band drive signal. 22 refs.

## Performance

**075534 DIELECTRIC RESONATORS FOR MICROWAVE INTEGRATED OSCILLATORS.** Dielectric resonators can be used to stabilize the frequency of the output signal of microwave integrated oscillators. Oscillators of this kind will be widely used in the near future in microwave receivers for satellite-television broadcasts. The required high Q-factor, low temperature-dependence and small dimensions of dielectric resonators only became feasible with the availability of mixed ceramics of  $Ba_2Ti_9O_{20}$  and  $BaTi_4O_9$  or  $TiO_2$ . These materials can be evaluated for their usefulness by generating microwave resonances in cylindrical samples and measuring the frequency spectra. In practice, dielectric resonators are disks. They are mounted in a metal case and can be mechanically tuned to the required frequency. The resonators have a small positive temperature coefficient to compensate for the negative temperature coefficients of other elements in the oscillator circuit. A locus for the impedance of coupling line, resonator and load of the active element in the oscillator circuit as a function of oscillation frequency can be drawn on the Smith chart. The intersection of this locus with the line for the input impedance of the active element gives the operating point. The position of the operating point may be stable or unstable. The oscillator circuits are designed for operation with reaction-type, transmission-type, reflection-type or feedback resonators. Stable oscillator circuits have been designed for transponders used in radiosondes. The use of dielectric resonators in oscillators for direct frequency synthesizers has also been investigated. (Author abstract) 15 refs.

**075535 BROAD TUNING RANGE VCOs FOR MICROWAVE SYSTEMS.** VCOs are important components in such microwave applications as local oscillators in frequency agile radars, instrumentation, missile seeker heads and other ESM/ECM systems where rugged units are required to operate in hostile environments. The widest tuning ranges are needed for EW in particular. The system engineer who requires a wideband electronically turned oscillator (ETO) will need to compare the relative advantages and disadvantages of the available oscillator types. The important parameters include linearity, modulation rate, noise and temperature stability, along with size, mass and total power consumption. Performance trade offs and some miniaturised oscillators are discussed. 2 refs.

Parkinson, Graham (Ferranti). *Electron Eng (London)* v 59 n 730 Oct 1987 p 85, 89-90, 93-94.

**075536 COMPARISON OF THE ENERGY EFFICIENCY OF MULTIDIODE MICROWAVE OSCILLATORS.** One way of increasing the output power of radioelectronic devices is to combine the powers of individual sources in a common load. This approach finds particularly extensive application at microwave frequencies where the development of high-power active elements (AE) encounters several difficulties (primarily ensuring reliable cooling). The design of combiner devices is based on utilization of equivalent circuits whose complexity and ramification rise sharply as the number of sources goes up. If we consider only the most desirable case from the practical viewpoint, where the active elements employed are identical, the design of the complete circuit of a device may be simplified to design of a reduced circuit with a single energy source. An appropriate analysis is presented. 2 Refs.

Bovsunovskii, A.Yu.; Tkachenko, L.A. *Radioelectron Commun Syst* v 30 n 10 1987 p 92-94.

**075537 HIGH-PERFORMANCE GAAS MMIC OSCILLATORS.** A number of monolithic single-ended and push-pull oscillator chips were developed for C-band through Ku-band applications. The chips were used to build both dielectric resonator oscillators and voltage-controlled oscillators in these frequency bands. These monolithic microwave ICs (MMICs) also have an integrated buffer amplifier at the oscillator output to provide better load isolation and power output stability. The oscillators demonstrated performance similar to conventional hybrid circuitry; however, the MMIC provided circuit simplicity with improved reliability, decreased size, and reduced manufacturing cost. 5 refs.

## Selection

**075538 LOCAL OSCILLATOR SELECTION FOR DIGITAL SATELLITE COMMUNICATIONS.** A microwave local oscillator (LO) subsystem is one of the most costly subsystems used in these stations. Dielectric resonator oscillator (DRO) technology, crystal oscillator-multiplier technology, and microwave device technology have made a number of different LO choices available to the system designer. A comparative study of different LO designs and their suitability for digital communications is presented. A step-by-step procedure is given for specifying the LO phase noise, which is the most important LO specification. 3 Refs.

Kumar, Surinder (Univ of Saskatchewan, Saskatoon, Sask, Can). *Microwave J* v 31 n 7 Jul 1988 p 129-135.

## Space Charge

**075539 ALLOWING FOR THE INFLUENCE OF SPACE CHARGE ON THE IMPEDANCE CHARACTERISTICS OF AN IMPATT DIODE IN DESIGNING MULTIDIODE MICROWAVE OSCILLATORS.** A promising way of combining the powers of individual solid-state microwave radiation sources is the method of combining power at the chip level. This involves the series connection into the resonant system of a multidiode oscillator of solid-state sources of microwave radiation in caseless configuration. This not only provides the possibility of 10% summation of the powers of the individual sources but also improves the noise characteristics of oscillators, all other conditions being equal. A comparison has been made of such an approach with a multidiode IMPATT oscillator using varicap tuning (and containing an arbitrary number of IMPATT diodes and varicaps in caseless configuration, connected in series into the resonant system of the oscillator). The IMPATT diode impedance characteristics obtained elsewhere were used without allowance for the influence of space charge; they

were reduced to a given equation. 5 Refs.

Kashtanov, S.F. *Radioelectron Commun Syst* v 30 n 10 1987 p 86-88.

## Stability

**075540 STABILIZING THE FREQUENCY OF DIODE MICROWAVE OSCILLATORS.** Relationships have been obtained permitting targeted selection of the structure of stabilized diode microwave oscillators and optimization of their parameters. A generalized optimal-adjustment algorithm is proposed. A method for oscillator synthesis is presented. (Author abstract). 5 Refs.

Machusskii, E.A. *Radioelectron Commun Syst* v 30 n 10 1987 p 25-31.

**075541 FREQUENCY STABILITY OF L-BAND, TWO-PORT DIELECTRIC RESONATOR OSCILLATORS.** Dielectric resonator oscillators operating at 1.5 GHz and 2.0 GHz were evaluated and show state-of-the-art, close-to-carrier phase noise performance. The oscillators are based on a two-port resonator design incorporated into a basic feedback-loop oscillator configuration. Typically, at 1-kHz carrier offset frequency the single-sideband phase noise levels were -130 dBc/Hz and -120 dBc/Hz for the 1.5-GHz and 2.0-GHz oscillators, respectively. Vibration sensitivity was also investigated and the resonators show fractional frequency changes per g in the range of  $10^{-7}$  to  $10^{-9}$  for the 1.5-GHz and 2.0-GHz designs. Measurements were also performed to characterize both the static and dynamic temperature sensitivities of the 2.0-GHz design. The static temperature coefficient was found to be approximately -1.40 ppm/°C, while the dynamic temperature coefficient was nominally -3000 ppm/°C/s, at 27.5°C. 12 refs.

## Theory

**075544 ANALYSIS OF LONG-TERM FREQUENCY DRIFT IN FET OSCILLATORS.** The authors analyze the long-term frequency drift observed in 11-GHz GaAs FET dielectric resonator oscillators. The analysis is based on device modeling. It is found that the dominant contributor to the long-term frequency drift is the gate-to-source channel capacitance of the GaAs FET. Results agree with the trends observed on dielectric

resonator oscillators, and good correlation between theory and measured data has been achieved. The observations are general and applicable to all oscillators with GaAs FETs as active devices. 5 refs.

**075547 SIMULATION OF TRANSIENT BEHAVIOR IN A PULSE-LINE-DRIVEN GYROTRON OSCILLATOR.** Results are reported for a set of slow-time-scale single-mode and fast-time-scale single-mode and multimode simulations of the transient-mode excitation phenomena in a short-pulse high-peak-power Ka-band gyrotron oscillator experiment. Both the slow- and fast-time-scale single-mode simulations are generally in good agreement with each other and, within experimental uncertainties, with the experimental observations of the time dependence and magnetic-field dependence of 35-GHz emission in the TE<sub>62</sub> mode. However, the multimode simulations suggest the presence of mode suppression, mode beating, and other nonlinear multimode phenomena that could not easily be observed in the experiment, and generally agree less well with the experimental measurements than the single-mode simulations. The multimode simulations also suggest that steady-state behavior may not be obtainable with the highly time-dependent voltage waveform employed in the experiment, and indicate the importance of carrying out future high-voltage gyrotron experiments with less highly transient voltage waveforms. 18 refs.

## OSCILLATORS, PARAMETRIC See Also ELECTRIC MOTORS, LINEAR.

## Modulation

**075549 INVESTIGATION OF RANDOM MODULATION OF THE OSCILLATIONS OF A GENERATOR WITH AN INERTIAL NONLINEARITY UNDER PARAMETRIC EXTERNAL ACTION.** Random oscillatory modes often appear in physically diverse dynamic systems. Such motions can be described quantitatively using the following characteristics: the spectra and the correlation functions associated with them, Lyapunov indicators, Kolmogorov's metrical entropy, and attractors of different dimension. Significant amounts of computer time are used to determine these characteristics from the experimental data. It is suggested that the threshold of synchronization, measured experimentally in real time, can be used as a quantitative characteristic and criterion of randomness for self-excited oscillatory systems. The relationship between the synchronization threshold and Kolmogorov's entropy was determined based on numerical experiments with a number of systems. This paper is devoted to an experimental study of the random modulation of oscillations in a generator with an inertial nonlinearity under parametric external action, leading to modulation of the gain of the active element. The synchronization threshold is used as one of the characteristics of the degree of randomness. 7 refs.

## Synchronization

**075550 SYNCHRONOUSLY PUMPED OPTICAL PARAMETRIC OSCILLATION IN BETA-BARIUM BORATE.** Optical parametric oscillation in beta-barium borate has been demonstrated using synchronous pumping by the frequency doubled output train from an actively mode-locked and Q-switched Nd:YAG laser. The parametric oscillator converts up to about 30% of the pump train to produce broadly tunable pulses (0.68 to 2.4 μm) of about 75 ps duration, with peak idler powers of up to about 1.6 Mw. The tuning range has been extended up to 0.53 μm by frequency doubling the idler output with up to about 3% efficiency. (Author abstract). 13 Refs.

## Analysis

**075551 SINGULAR PERTURBATION APPLIED TO THE RELAXATION OSCILLATIONS OF THE VAN DER POL OSCILLATOR.** Using a singular perturbation technique, the non-sinusoidal (relaxation) oscillations of the Van der Pol nonlinear oscillator are investigated. For high frequency and large transconductance and mutual inductance, a small parameter  $\epsilon$  is found to be the multiplication factor to the highest order term in the nonlinear equation. When  $\epsilon \rightarrow 0$  the equation and its solution become singular. The oscillation and its period can be calculated by proper matching at the voltage jump where the singularity occurs. The method is also applicable to relaxation problems of other nonlinear oscillators. (Author abstract) 4 refs.

## Analysis

**075554 INFLUENCE OF TRANSIT-TIME EFFECTS ON THE OPTIMUM DESIGN AND MAXIMUM OSCILLATION FREQUENCY OF QUANTUM WELL OSCILLATORS.** A small-signal analysis of quantum-well oscillators is presented. The analysis includes the transit-time effects associated with a depleted spacer layer outside the quantum well. These transit-time effects are found to dominate device characteristics and to lead to dramatic increases in achievable negative resistance. Closed-form expressions are derived for specific negative resistance and cutoff frequency, and a universal curve relating maximum transit-time negative resistance, quantum-well current-voltage characteristics, and frequency is found. Design considerations to maximize the oscillation frequency threshold are discussed. The analysis also shows that the effective limit on the maximum oscillation frequency of practical quantum-well oscillators is determined by a combination of impedance matching constraints and minimum-achievable contact resistance. 37 refs.

**Mathematical Models** See Also SIGNAL RECEIVERS—Mathematical Models.

**075557 DEVELOPMENT OF A NEW THREE-PHASE TRIANGULAR WAVE OSCILLATOR.** The present paper is another one in a series of papers on the development of models of precisely stabilized three-phase oscillators. A new model of a three-phase triangular wave oscillator is developed by considering its expected analogy to previously suggested models of sinusoidal and triangular wave oscillators in two and three phases. The development is validated by solving the nonlinear model equations on a digital computer. The expected advantages of the new model and its envisaged applications are considered in the conclusion section. The paper possesses a further value in serving as a tutorial review in the field of precisely stabilized oscillators. The review is carried out with the aid of a relatively new concept of 'invariants' associated with the damping stabilization forces in the oscillator systems. (Author abstract) 16 refs.

Kaplan, B.Z. (Ben Gurion Univ of the Negev, Beer Sheva, Isr); Yardeni, N.D. *Comput Methods Appl Mech Eng* v 63 n 3 Aug 1987 p 305-312.

**075558 INVESTIGATION OF THE CHAOTIC DYNAMICS OF A RING-TYPE SELF-EXCITED OSCILLATOR WITH AN ASYMMETRIC CHARACTERISTIC OF THE NONLINEAR ELEMENT.** The stochastic dynamics of a ring-type self-excited oscillator, consisting of RC and RLC filters and an inertialess nonlinear amplifier, is investigated. The characteristics of the appearance and evolution of strange attractors (SA) are studied experimentally. The special features of the mathematical model, related to the nonlinear element asymmetry, are analyzed. It is shown that a model with a symmetric characteristic is structurally unstable with respect to asymmetric perturbations. Experimental and calculated diagrams of the oscillatory modes of operation in the oscillator are given. (Author abstract) 12 refs.

Dmitriyev, A.S.; Starkov, S.O. *Sov J Commun Technol Electron* v 32 n 4 Apr 1987 p 60-69.

**075559 ANALYSIS OF MOS TRANSFORMER-COUPLED OSCILLATORS.** Techniques for estimating the steady-state voltage amplitudes of MOS transformer-coupled oscillators are presented. A noniterative procedure based on equations and graphical data is used and no simulations are required. By appropriate normalization of variables the graphical data can be applied to arbitrary transistor sizes and bias conditions. Both single-ended and source-coupled configurations are analyzed. A simple analysis is presented for the squegging phenomenon which exists in single-ended stages. This analysis is used to determine the condition for avoiding squegging. Comparisons are made with SPICE2 simulations and good agreement is achieved over a wide range of operation. 6 refs.

## Vibrations

**075562 MODE SELECTION IN A MULTIMODE SAW OSCILLATOR USING FM CHIRP MIXING SIGNAL INJECTION.** Mode-selection control of a multimode surface-acoustic-wave (SAW) oscillator has been obtained using SAW linear FM chirp signal injection. The prototype 60-100-MHz SAW oscillator design employed a single-phase unidirectional transducer (SPUDT) low-loss comb filter in the feedback loop, with minimum insertion loss of  $\approx 3.7$  dB. Mode selection was achieved using an injection signal derived from the mixed output of two 27.5-52.5-MHz up- and down-chirp SAW filters. Mode switching times of  $\leq 2$   $\mu$ s were obtained. The device could be useful as a local oscillator on frequency-agile radars, where hopping is required over a moderate number of frequencies. 11 refs.

## OSCILLOGRAPHS

**075564 DIGITAL STORAGE OSCILLOSCOPE WITH 100 MSAMPLES/S.** While digital storage oscilloscopes are increasingly being preferred, their high cost has compelled many engineers to manage with an analogue instrument. However, a new dual-channel oscilloscope eliminates this remaining disadvantage while still incorporating virtually all the features of the expensive models.

Burgess, G. *Electron Wireless World* v 94 n 1626 Apr 1988 p 366-369.

**Applications** See WAVEFORM ANALYSIS—Equipment.

**Errors** See MEASUREMENT ERRORS—Analysis.

**Medical Applications** See BIOMEDICAL EQUIPMENT—Testing.

**OSCILLOSCOPES, CATHODE RAY** See Also CAMERAS—Applications; ELECTRIC MEASUREMENTS—Voltage; OPTICAL INSTRUMENTS; PROBES—Microwaves.

**075565 DSOs CAN MAKE TESTING EASIER.** Digital storage oscilloscopes (DSOs) are becoming the best choice for some test and measurement applications. The types of waveforms being dealt with determine whether or not a particular application is better served by a DSO. Waveforms difficult to see on conventional scopes can be digitally saved with the DSO to produce clear, stable displays. The annoying display flicker common when viewing low-repetition index marks and strobing also is eliminated. Other important advantages like waveform digitizing and storage, peak detection sampling, and built-in-processing are described.

**075566 PRECISION DIGITAL OSCILLOSCOPES AND WAVEFORM RECORDERS.** The author discusses a precision instrument family consisting of five digitizing oscilloscopes based on three waveform recorders and an analysis, display, and I/O section. He focuses on the HP 5183A waveform recorder, the precision digital trigger, the time base system, and the memory system. 2 refs.

Sorden, James L. *Hewlett Packard J v 39 n 1 Feb 1988 p 6-11, 14.*

**075567 WAVEFORM RECONSTRUCTION TECHNIQUES FOR PRECISION DIGITIZING OSCILLOSCOPES.** The maximum sample rate, dynamic performance, and reconstruction strategy of a digitizing oscilloscope determine its bandwidth. The dynamic performance specification determines the sampling accuracy near the Nyquist rate. Waveform reconstruction allows signals sampled near the Nyquist limit to be displayed with accuracy approaching the sampler-imposed limits. The reconstruction algorithm accuracy can be specified as a design parameter. Speed of operation, reconstruction filter impulse response length, and reconstruction accuracy are interrelated. Reconstruction is also useful when memory constraints dictate sampling slower than the minimum digitizer rate. A good reconstruction algorithm allows the user to take maximum advantage of the digitizing oscilloscope's memory by allowing sampling near the Nyquist limit. 1 ref.

Page, Richard W.; Foster, Allen S. *Hewlett Packard J v 39 n 1 Feb 1988 p 26-31.*

**075568 PRECISION DIGITIZING OSCILLOSCOPE WAVEFORM ANALYSIS, DISPLAY, AND INPUT/OUTPUT.** The author describes the HP 5180T/U, HP 5183T/U, and HP 5185T precision digitizing oscilloscopes, each consisting of a waveform recorder and an analysis, display, and I/O module. The waveform recorder is the HP 5180A, the HP 5183A, or the HP 5185A. The display is a 9-inch-diagonal 2048×2048-point addressable vector CRT display that generates high-resolution text and waveform images. System control is managed by a real-time multitasking operating system that simultaneously handles multiple processes such as keyboard entry, data analysis, and waveform display. A 6803 microprocessor manages all front-panel inputs including hardkey and data entry knob control firmware and scanning control for the touchscreen display. 4 refs.

Nichols, Douglas C. *Hewlett Packard J v 39 n 1 Feb 1988 p 53-64.*

**075569 ONE-GIGASAMPLE-PER-SECOND DIGITIZING OSCILLOSCOPE.** A brief description is given

of the HP 54111D oscilloscope. This instrument's high sampling rate makes it particularly useful for analyzing high-speed, one-shot occurrences. A blend of state-of-the-art designs was required to achieve this performance. (Edited author abstract)

## Applications

**075570 HARDWARE SYSTEM DESIGN FOR A VECTOR ANALYZER.** The HP 8980A Vector Analyzer is designed to measure instantaneous amplitude and phase of wideband RF and microwave signals by analyzing their I and Q components in the time domain. It is a fully programmable HP-IB (IEEE 488/IEC 625) instrument designed for R&D and production applications. The amplitude and phase of a signal can be analyzed visually by plotting the Q component versus the I component graphically in Cartesian coordinates. The amplitude is then represented by the distance from the center of the plot and the phase is represented simply by the angle thereon. The polar displays of vector network analyzers work on this same principle. 3 refs.

Naegeli, Andrew H.; Grau, Juan. *Hewlett Packard J v 38 n 11 Dec 1987 p 6-17.*

**075571 FIRMWARE SYSTEM DESIGN FOR A VECTOR ANALYZER.** The HP 8980A Vector Analyzer is an example of this substantial change in the importance of software in electronic instrumentation. It uses a 32-bit 68000 microprocessor for overall control, in addition to a keyboard processor, an HP-IB (IEEE 488/IEC 625) interface processor, and a CRT display processor. A half megabyte of software used is written in C and, where optimization for speed was critical, in assembly language.

Messenger, Brian S.; Fisher, Peter H.; Woods, Stanley P. *Hewlett Packard J v 38 n 11 Dec 1987 p 17-24.*

## Circuits

**075572 NEW KIND OF OSCILLOSCOPE FOR WIDEBAND SAMPLING.** A new kind of oscilloscope for digital and pulsed-rf testing is introduced, one that combines a wideband repetitive-sampling capability with a time-domain network analyzer. The 20-GHz HP 54120T is tailored for such work as characterizing very high-speed digital circuits and nonlinear microwave devices and tuning their computer-aided-design models; developing transmission-line designs for printed-circuit boards, computer backplanes, and hybrid integrated circuits; and analyzing data communications channels. The new sampling scope can analyze repetitive waveforms with rise times as short as 17.5 ps. Just as important for precision work, it is designed for very high transient response, measurement resolutions to 0.25 ps and 32  $\mu$ V, and virtually drift-free operation.

## Computer Applications

**075573 DAS DSO ALS INTELLIGENTES MESSSYSTEM.** [Digital Storage Oscilloscope (DSO) as Intelligent Measurement System]. The combination of computer and oscilloscope furnishes two possibilities. These are: the integration of the computer in the oscilloscope or the measuring instrument in the computer. A computer-type oscilloscope is presented. It is pointed out why this is the most viable method to extend the applications of the DSO. In German.

Westenberger, Heinz. *Elektronik v 37 n 1 Jan 8 1988 p 83-84.*

**Design** See Also ELECTRONICS PACKAGING.

**075574 FRONT-END SIGNAL CONDITIONING FOR A HIGH-SPEED DIGITIZING OSCILLOSCOPE.** The design of the front-end signal conditioning stages of the HP 54111D oscilloscope is discussed. The design was particularly difficult because of the HP 54111D's 500-MHz required signal bandwidth. Key elements in the design are the attenuator, the switch assembly, the hybrid circuit upon which the attenuator is fabricated, and the preamplifier.

Bohley, Thomas K.; Mathews, Mark E.; Dove, Lewis R.; Millard, Joe K.; Bigelow, David W.; Skarke, Donald D. *Hewlett Packard J v 39 n 3 Jun 1988 p 67-69.*

## Digital Devices

**075575 DIGITAL STORAGE OSCILLOSCOPES.** Whether one uses them for single-shot storage, taking measurements, or troubleshooting, the latest digital storage oscilloscopes (DSO) provide a number of measurement features that can help you work faster and more accurately. The available DSOs now include models with 1-GHz bandwidths and digitizing rates to 1 G samples. (Edited author abstract)

**Digital Readout** See Also WAVEFORM ANALYSIS—Automatic Testing.

**075576 AMPLITUDEAUFLÖSUNG UND -MESSFEHLER VON DIGITAL-OSZILLOSKOPEN.** [Amplitude Resolution and Measurement Errors of Digital Oscilloscopes]. The amplitude resolution of a digital oscilloscopes can be made equal to the theoretical resolution of the analog-to-digital converter only in the ideal case. The realistically attainable resolution depends on a multiplicity of factors which are discussed. In German. 2 refs.

Hancock, Johnie. *Elektronik v 36 n 25 Dec 11 1987 p 72-74, 76-78.*

**075577 DIGITAL SCOPES MAKING WAVES IN TEST, MEASUREMENT WORLDS.** Today's designer must deal with all kinds of circuitry - digital and analog - not to mention the inherent firmware and interface problems when he integrates all these into a system or product. During the past five years, digitizing oscilloscopes have evolved to respond to those needs. Because these instruments enhance the traditional tasks of an analog oscilloscope with microprocessor control, they can make significant contributions in all areas of electronic test and measurement. The power and versatility of the latest digitizing scopes can be seen by considering their role in such design and test areas as power supplies, analog circuits, digital circuits, and system integration. Triggering, pulse isolation, and worst-case delay measurements are discussed.

Schade, Sylvia (Hewlett Packard Co, Colorado Springs, CO, USA); Kushnir, Ray. *Electron Des v 36 n 14 Jun 19 1986 p 117-120, 122, 124.*

**075578 ZEITINTERVALL-MESSGENAUIGKEIT VON DIGITAL-OSZILLOSKOPEN.** [Measurement of Accuracy of Time Interval in Digital Oscilloscopes]. It is pointed out that the measurement accuracy associated with the acquisition of single pulses is higher in digital oscilloscopes than in analog storage oscilloscopes. It is limited only by the characteristics of the quartz crystal. 2 refs. In German.

Hancock, Johnie. *Elektronik v 37 n 1 Jan 8 1988 p 94-97.*

## Performance

**075579 DIGITAL SCOPES.** To make the engineer's job easier, a lot of emphasis is being placed on improving the fundamentals of waveform capture in digital scopes. Advances in charge-coupled devices (CCDs) and flash

converters are pushing analog-to-digital conversion speeds to 100 to 200 MHz, extending the usable bandwidth for single-shot measurements to 50 MHz or so. For repetitive signals, digital scopes with a 1-GHz bandwidth are now a reality, and special glitch detection circuitry today captures transient spikes beyond the limitations imposed by basic a-d converter speeds. Additional features are described.

Milne, Bob. *Electron Des* v 34 n 3 Feb 6 1986 p 98-102, 104, 106.

**075580 EVALUATING THE PERFORMANCE OF PULSE AND OSCILLOSCOPE MEASURING INSTRUMENTS BY THE ACCURACY OF INSTANTANEOUS SIGNAL MEASUREMENTS.** Metrological properties of pulse and oscilloscope measuring instruments (MI), such as cathode-ray tube (CRT) oscilloscopes, pulse generators, and instantaneous-value voltmeters, are regulated by GOST 8.009-84, GOST 8.256-77, GOST 22261-82, GOST 22737-77, and GOST 11113-82 standards. The basic standards (GOST 8.009-84 and GOST 8.256-77) establish the need for separate static and dynamic specifications for all MIs. These demands have been published as specific lists of MI parameters and values. The drawbacks seriously impede the improvement of the speed of response of measuring instruments. One of the possible ways to optimize the system of rated parameters and to reduce their number is to evaluate the performance of pulse and oscilloscope measuring instruments by their error of measuring (setting, in the case of pulse generators) instantaneous values of voltages. 4 refs.

Manevich, V.Z.; Khamadulin, E.F. *Meas Tech* v 30 n 2 Feb 1987 p 191-193.

**075581 OSCILLOSCOPE ARCHITECTURE: A CASE OF REVOLUTION RATHER THAN EVOLUTION.** The development of the Tektronix 11400 series of digitizing oscilloscopes is discussed. The radically new architecture of these instruments, which is based on three Intel microprocessors, is described. Their performance is examined.

Anon (Tektronix UK Ltd, Globe Park, Engl). *Electron Wireless World* v 94 n 1624 Feb 1988 p 156-158.

**075582 PORTABLE ANALOG SCOPE BARES SIGNALS HIDDEN EVEN FROM DIGITAL STORAGE UNITS.** Fleeting responses like aberrant signals, unseen jitter, the one-in-a-thousand switching fault, and the random glitch have often eluded design troubleshooters. Conventional scopes usually cannot reveal signals that occur too infrequently to sustain display-phosphor excitation. A new scope is reported which features a high visual writing rate, greater than 4 div/ns, due to the microchannel-plate (MCP) CRT that shows even the most fleeting signals. In addition to more revealing displays, it also has a bandwidth of 350 MHz and sweep rates of 500 ps/div.

Bristol, Rod (Tektronix Inc, Beaverton, OR, USA); Hillman, Alfred K. *Electron Des* v 33 n 7 Mar 20 1986 p 125-128, 130.

## Reviews

**075583 SPECIAL REPORT: DIGITAL SCOPES ARE SET TO CHALLENGE ANALOG UNITS.** Digital oscilloscopes are discussed and compared with their analog counterparts. Their new capabilities are emphasized, such as higher sampling speed, deeper acquisition memories, laser screen update rates, and improved user interfaces. However their higher prices, aliasing, control, and sequential sampling discourages potential users. A list of representative high-frequency digital oscilloscopes and their characteristics is finished.

## OSMIUM AND ALLOYS

**Electrolytic Analysis** See PLATINUM AND ALLOYS—Electrolytic Analysis.

## Spectroscopic Analysis

**075584 DETERMINATION OF Os ISOTOPES AND Re/Os RATIOS USING AMS.** We report here results of recent determinations of osmium isotope ratios and rhenium/osmium ratios measured with AMS. Because Re forms negative atomic ions with a considerably lower efficiency than Os, Os isotopes can be determined with minimal isobaric interference at mass 187. Detection limits for AMS measurements of osmium are 20 ppb in chemically untreated samples and 0.01 ppb in samples where Os has been preconcentrated with a nickel sulfide method. The fact that Re and Os each form negative ions as oxides at a comparable rate has been used to determine Re/Os ratios in untreated meteorite samples. (Author abstract) 22 refs.

## OSMIUM COMPOUNDS

**Decomposition** See CATALYSTS—Materials.

**Synthesis** See Also ORGANOMETALLICS.

**075585 SYNTHESSES OF INTERLAMELLAR MONTMORILLONITEDIPHENYLPHOSPHINE T-RIOSMIUM CLUSTER COMPLEXES.** In our study, we chose the  $H_2O_3(CO)_{10}$  complex for anchoring on the support, since the cluster is an active isomerization catalyst and isomerization is an important transformation in organic chemistry. We report in this communication the synthesis and characterization of montmorillonite-diphenylphosphine- $H_2O_3(CO)_{10}$  (B) and  $H_2O_3(CO)_9$  (C) complexes for the first time. In addition, these complexes are examined in the alkene isomerization reactions. It is shown that catalyst B is inactive isomerization of hex-1-ene. This is ascribed to its coordinative saturation. Catalyst C is active in isomerization of hex-1-ene affording 76% of hex-2-ene compared which its homogeneous analogue  $H_2O_3(CO)_9PPh_3$  which gave poor yields due to its decomposition. This is another indication that anchored cluster complexes are more stable. 9 refs.

## OSMOSIS

**075587 ELECTROKINETIC PHENOMENA AT THE IONIC SURFACTANT SOLUTION-AIR INTERFACE. ELECTROOSMOSIS ALONG A PLANE INTERFACE. EXPERIMENTAL METHODS.** The results of an experimental check of an earlier developed theory of a method of measuring the rate of electroosmosis along a plane solution-air interface are presented. Methods of experimental investigations based on the use of this method are discussed. To increase the accuracy of the experiment the position of the liquid-gas interface was

recorded with respect to the first indicator particles, as which poorly sedimenting particles of monodisperse polystyrene latex with a diameter of 1.27  $\mu m$  were used, visible in the field of view of the reading microscope. To avoid the error related to possible sedimentation of the indicator particles, this procedure was carried out both after pouring the investigated solution into the cell and after the end of the measurement. 3 refs.

### Filters

**075588 SIMULTANEOUS ACTION OF HYDROSTATIC AND OSMOTIC PRESSURE GRADIENTS ON CELLOPHANE MEMBRANES.** Measurements were made of volume flows generated by the simultaneous application of hydrostatic and osmotic pressure gradients. When the osmotic pressure gradient across the membrane was maintained constant, there was a linear relationship between the observed flows and the applied hydrostatic pressure differences. Examination of the results using the asymmetric membrane model proposed by Lee, Baker and Lonsdale showed good agreement between calculated and observed flows. The solvent (sucrose) molecular radius and the potential causing the steric exclusion by the pore wall were calculated from the observed flows. (Edited author abstract) 19 refs.

Serrano, F. (Univ of Malaga, Malaga, Spain); Fernandez-Pineda, C. *J Non Equilib Thermodyn* v 13 n 2 1988 p 147-159.

**075589 DEVELOPMENT OF WET-DRY REVERSIBLE REVERSE OSMOSIS MEMBRANES WITH HIGH PERFORMANCE FROM CELLULOSE ACETATE AND CELLULOSE TRIACETATE BLENDS.** Wet-dry reversible membranes were prepared by a two-step coagulation procedure. A cast film containing a blend of cellulose acetate and cellulose triacetate as polymers, dioxane and acetone as solvents and maleic acid and methanol as additives was immersed consecutively in two aqueous coagulation baths, the first bath being kept at 0°C and the second at 60°C. The effects of casting solution composition and coagulation conditions on reverse osmosis performance and membrane morphology were examined. Light transmission measurements and demixing experiments have been carried out to investigate phase separation. High performance membranes have been obtained with salt rejections of more than 99% and permeation rates in the range of 10-12 l/m<sup>2</sup> h. These desalination properties, combined with a good wet-dry reversibility, make our membranes superior to reverse osmosis membranes hitherto produced. (Edited author abstract) 23 refs.

**075590 FLOW PATTERNS IN RADIAL FLOW HOLLOW FIBER REVERSE OSMOSIS SYSTEMS.** In the past, mathematical models describing the separation characteristics of radial flow hollow fiber reverse osmosis units have used ideal plug-flow models. Recently,

Soltanieh and Gill have developed a model based on the assumption of complete mixing on the shell side of these modules. The purpose of this study is to determine by independent experiments which flow model best described these units, and describe radial flow packed bed systems in general. Experimentally obtained tracer-response curves are compared to theoretical response curves based on the plug-flow and complete-mixed models. A theoretical model which is based on Darcy's law for time variable flow, the complete-mix time variable (CMTV) flow model, was found to fit the experimental data well. (Author abstract) 10 refs.

**Applications** See Also SEAWATER—Salt Removal; WASTEWATER—Treatment.

**075593 REMOVAL OF RADIONUCLIDES FROM LIQUID STREAMS BY REVERSE OSMOSIS.** Separation of radionuclides in trace concentrations by cellulose acetate membranes has been under investigation in this laboratory, and the behavior of some important radionuclides such as  $^{137}\text{Cs}$  and  $^{90}\text{Sr}$  under reverse osmosis has been reported earlier. The present work deals with a few other typical radionuclides such as  $^{60}\text{Co}$ ,  $^{103}\text{Ru}$  and  $^{131}\text{I}$  which are not fully amenable to conventional methods for their removal. Separation of these radionuclides from liquid streams by the reverse osmosis process was studied using a small reverse osmosis test cell. Various parameters like membrane porosity, applied pressure and feed activity levels were investigated. (Edited author abstract) 21 refs.

**075594 SEPARATION OF MIXTURES OF ORGANIC SUBSTANCES USING REVERSE OSMOSIS MEMBRANES.** A concentration of various aqueous and nonaqueous solutions by the reverse osmosis process is interesting from its energy saving nature. However, there is a barrier due to the osmotic pressure and it has been very difficult to overcome. In this work a membrane cascade system, which used an effective osmotic pressure difference, was developed to cope with this problem. For this purpose reverse osmosis separation data of aqueous ethanol and isopropanol solutions were obtained. (Edited author abstract). 2 Refs. In Japanese.

**Efficiency** See FEEDWATER TREATMENT.

**Equipment** See Also DESALINATION; MEMBRANES—Materials.

**075595 ANALYTICAL DESIGN EQUATIONS FOR MULTISOLUTE REVERSE OSMOSIS SYSTEMS.** Analytical equations are developed for tubular, spiral-wound, and plate-and-frame reverse osmosis (RO) modules to predict the membrane channel length for achieving a given fractional solvent recovery for a dilute feed with two highly rejected solutes. Extension to a large number of noninteracting solutes is straightforward. Analytical equations to predict the permeate solute concentrations are also developed. These design equations are simple to use and can be applied for both laminar and turbulent flow conditions. On the basis of these design equations, some approximate design equations are also derived. The predicted dimensionless length of the module and the average permeate concentrations are compared with the results obtained by numerical integration and found to be in excellent agreement. (Edited author abstract) 6 refs.

Palanki, Srinivas (Indian Inst of Technology, New Delhi, India); Gupta, Sharad K. *Ind Eng Chem Res* v 26 n 12 Dec 1987 p 2449-2454.

**075596 REVERSE OSMOTIC CONCENTRATION OF AQUEOUS 2-BUTANONE (METHYL ETHYL KETONE), TETRAHYDROFURAN AND ETHYL ACETATE SOLUTIONS.** Reverse osmotic concentration of aqueous MEK, THF and EAc solutions was carried out using five composite membranes (PEC-1000, FT-30 BW, FT-30 SW, NS-100 P1700, NS-100 P3500) and cellulose acetate membrane. Separation of solute and permeation through the membranes were measured under the following conditions: concentration of MEK, 1-8.2 wt%; concentration of THF, 0.7-6.3 wt%; concentration of EAc, 0.8-3.9 wt%; operating pressure, 4-6 MPa. PEC-1000 gave the best solute separation for each system. Its separation was above 97.5% for MEK system, above 99% for THF system and above 97% for EAc system. Membrane constants were calculated by the Spiegler-Kedem membrane transport model. The deviation from this model was corrected by compaction coefficients. (Edited author abstract) 23 refs.

## Filters

**075598 OSMOSIS AND THERMO-OSMOSIS THROUGH CELLULOSE ACETATE MEMBRANES.** Osmotic experiments have been carried out by using aqueous solutions of sucrose and cellulose acetate membranes. Two coupling phenomena between the processes of osmosis and of thermosmosis have been considered. In the first a variable thermosmotic flow was opposite to a fixed osmotic flow. The analysis of the results permits to obtain a temperature difference which is equivalent to a concentration difference. In the second, the evolution towards steady states was obtained, when a

temperature difference and a concentration difference were acting simultaneously across the membrane. (Edited author abstract) 33 refs.

Mengual, J.I. (Univ Complutense de Madrid, Madrid, Spain); Garcia-Lopez, F.; Fernandez-Pineda, C. *J Non Equilib Thermodyn* v 13 n 2 1988 p 177-191.

## Industrial Applications

**075599 REVERSE OSMOSIS FOR THE SEPARATION OF ORGANICS FROM AQUEOUS SOLUTIONS.** The properties of modern polymer membranes with respect to organic aqueous solutions are discussed to some extent. The potential of reverse osmosis for the treatment of organics-contaminated waste water is demonstrated by a discussion of two examples - landfill-drainage water and 'desorbate'. It is shown that in the case of partial immiscibility, a combination of reverse osmosis and phase separation allows operation at very high recovery rates without exceeding tolerable concentrations of organics within the reverse osmosis modules. Furthermore, it is shown that a purification of the organic phase by pervaporation is economically feasible. (Author abstract) 15 refs.

Rautenbach, Robert (RWTH Aachen, Aachen, West Ger); Janisch, Ingo. *Chem Eng Process* v 23 n 2 Mar 1988 p 67-75.

## Mathematical Models

**075600 DESIGN AND ANALYSIS OF A RADIAL-FLOW HOLLOW-FIBER REVERSE-OSMOSIS SYSTEM.** The mathematical analysis of a radial-flow hollow-fiber module is carried out by assuming that the solution-diffusion model is applicable for the transport across the membrane wall. Two analytical equations are developed which can be used for the design and analysis of a radial-flow hollow-fiber system. The characteristics of a B-9 hollow fiber module of Du Pont are determined by using these equations. The predicted values of dimensionless parameters, mass-transfer coefficient and solute diffusivity, are compared with the values obtained from numerical analysis, and the agreement between the two predictions is found to be excellent. It is also shown that the design equations simplify considerably when the solute rejection is high and the dimensionless mass-transfer coefficient is large. (Author abstract) 7 refs.

Gupta, Sharad K. (Indian Inst of Technology, New Delhi, India). *Ind Eng Chem Res* v 26 n 11 Nov 1987 p 2319-2323.

**075601 CALCULATING MEMBRANE SELECTIVITY IN REVERSE OSMOSIS SEPARATION OF MULTICOMPONENT ELECTROLYTE SOLUTIONS WITH CONSIDERATION OF THE INTERPHASE POTENTIAL JUMP.** The mechanism of appearance of the interphase potential jump is qualitatively described. A method is proposed for calculating selectivity in multicomponent systems. The results of such calculations for a number of mixtures are presented, together with the experimental selectivity values obtained in a series of cellulose acetate membranes produced by the VNISS Institute (in Vladimir). The agreement between experimental and calculated values is quite satisfactory. 11 refs.

## Theory

**075602 REVERSE OSMOSIS SYSTEM FOR AN ADVANCED SEPARATION PROCESS LABORATORY.** This paper focuses on the development of a small pilot unit for use in an advanced separations process laboratory. The end goal is to develop experiments with advanced separation processes such as reverse osmosis, ultrafiltration, adsorption, chromatography, etc. This paper presents one step in that direction. The system that was developed for an advanced separations laboratory

was based on using small spiral wound membranes and can operate at feed rates to 10 gpm and pressures to 1000 psi. Feed flow, solute concentration, temperature, pressure, and recovery can all be independently varied. The system can operate in various flow schemes. Experiments investigate simple operational parameters and mass transfer characteristics. Permeate production and solute rejection are studied. More detailed experiments involving organic separation, concentration polarization and fouling and other membrane configurations can be performed. 8 refs.

## OVENS, INDUSTRIAL See Also ELECTRON TUBES, MAGNETRON—Applications; SILICATES—Heat Treatment; SOILS—Moisture Determination.

**075603 IS THIS NOW EUROPE'S LARGEST MEDIUM WAVE INFRA-RED OVEN?** Europe's largest medium wave infrared curing tunnel (nearly 100ft. long) has been designed, manufactured and installed for Austin Rover. The paint sealant used is a thermosetting material and when applied to the vehicle under ambient conditions will remain tacky for a considerable period of time. The curing oven design is described.

Anon. *Finishing* v 11 n 9 Sep 1987 p 18-19.

**075604 OVENS: ALL SET FOR A RADIANT FUTURE?** The article describes Maywick radiant ovens. The application mentioned is aluminum castings coated with nylon powder. The internal surfaces of the oven are clad in polished stainless steel, enabling radiant energy from the 850°C surface temperature burners to be employed to its maximum. The fuel is natural or LP gas.

Anon. *Finishing* v 12 n 6 May 1988 p 35-36.

**075605 GENTLER DRYING WITH VACUUM OVENS.** A new range of industrial vacuum ovens has been announced by Heraeus Equipment Ltd. Called VHT, the ovens overcome the problems associated with conventional drying processes using radiation or hot air recirculation, in which the solvent is shielded from the energy source, as with the drying of powders. There is also the tendency of some materials to oxidize at high temperatures in air circulation ovens which is not the case with vacuum models.

Anon. *Finishing* v 12 n 6 May 1988 p 40-41.

## Control

**075606 USE OF THE ELEKTRONIKA MK-64 CALCULATOR FOR CONTROLLING AN ELECTRIC OVEN.** A description is given of a temperature stabilizer and program control consisting of an Elektronika MK-64 microcomputer, V7-28 digital voltmeter, and control device. The temperature is stabilized with an accuracy of 0.1°K. (Author abstract) 6 refs.

Yunusov, M.S. (Tashkent Electrotechnical Communications Inst, USSR); Abdurakhmanov, Yu.Yu.; Kim, V.M.; Ob'edkov, E.V. *Instrum Exp Tech* v 30 n 3 pt 2 May-Jun 1987 p 748-749.

## Convection

**075607 FORCED CONVECTION CURING OVENS FOR POWDER COATING.** The forced convection curing oven is the most popular curing equipment in use in the powder coating industry. The most popular method of heating is a direct gas fired heating system. The advantages of forced convection curing are: (1) Running costs; (2) flexibility of storing temperature and curing cycle; (3) a forced convection oven is capable of processing a wide range of weight, size and complexity of components. Most plant users feel these advantages outweigh the only major disadvantage, which is floor space occupied by the oven, in comparison to infrared curing systems.

Stordy, Michael (United & General Engineering Co,

Leatherhead, Engl). *Prod Finish (London)* v 41 n 5 May 1938 p 16, 18.

Design See PRINTED CIRCUITS—Testing.

## Electric

**075608 ELECTRIC OVENS FOR PAINT DRYING AND POWDER CURING.** Electric ovens are widely used by product finishers for the drying of spray-painted and powder-coated items. One reason for their selection is the variety of equipment available, which means that there is an electric option for almost every drying requirement. Controllability is often another key factor in the decision to 'dry electric'. Two examples of companies who have benefitted from the installation of electric ovens are described.

Anon. *Prod Finish (London)* v 41 n 5 May 1938 p 15.

Evaluation See AGRICULTURAL PRODUCTS—Moisture Determination.

## Microwaves

**075609 SECURITE ELECTRIQUE ET NORMALISATION DES FOURS A MICRO-ONDES.** [Electrical Safety and Microwave Oven Standardization]. Based on IEC publications, European bodies established standards to assure safety and the required characteristics of microwave ovens. The paper discusses the main points of the French standard and the changes being prepared. (Edited author abstract) In French.

Sensors See BAKERIES—Ovens.

## Standards

**075610 IEC PERFORMANCE MEASUREMENT STANDARD FOR MICROWAVE OVENS - BACKGROUND AND RELEVANCE.** The International Electrotechnical Commission (IEC) will soon publish a new performance measurement standard. The work is described and analyzed, as is the current continuing work. The microwave power output measurement as a problem of method and relevance is dealt with. (Edited author abstract)

Risman, Per O. (Microtrans AB, Landvetter, Swed); Ohlsson, Thomas. *J Microwave Power Electromagn* v 22 n 3 1987, Radio Freq Ind Appl, 1987 p 181.

## Temperature Control

**075611 IMPROVEMENT IN THE RELIABILITY OF STANDARD CELL ENCLOSURES.** A description is given of the design of a new temperature-regulation circuit, which is used as an outer oven controller for new standard cell enclosures, with the emphasis on improving the reliability of the temperature control. A redundant protection circuit is used to prevent loss of temperature control caused by component failures in the controller. The temperature control of the outer oven of the enclosure is better than 0.4 mK per °C change in ambient temperature. When used with the additional inner controller the sensitivity of the cell temperature to the ambient temperature is improved to 20 µK/°C. The authors describe in detail the new circuit, summarizes the enclosure construction, and presents data on the performance of the system. (Edited author abstract). 2 Refs.

## Vacuum Applications

**075612 HIGH-TEMPERATURE FURNACE WITH FIELD-EMISSION ELECTRON HEATING.** A high-temperature tubular oven is described that works under vacuum and is heated by electrons emitted by field-emission annular cathodes made of carbon fibers. The heating zone is indicated by the length of the luminous annular region in the wall as 3.5-7.0 mm long at 800-2200°C, power drawn 2.9-30 w. (Author abstract) 7 refs.

## Applications

**075614 APPLYING SURGE SUPPRESSORS.** Protecting electric power systems from overvoltages caused by lightning, switching surges and other disturbances is an increasingly important concern among design professionals. Without proper protection, overvoltages can result in serious damage to equipment and loss of power supply. By applying properly selected surge suppressors to electric power systems, transformers and other apparatus can be protected. A review of suppressors in use today along with design fundamentals and guidelines for their use are presented.

## Equipment

**075615 CONSIDERAZIONI SUI CRITERI PER LA VERIFICA DELL'AFFIDABILITA' DEGLI SCARICATORI AD OSSIDO DI ZINCO.** [Considerations on the Criteria for Verifying the Reliability of Zinc Oxide Surge Arresters]. The use of zinc-oxide surge arresters, as a device to protect plant components against overvoltages, imposes nowadays the requirement to set-up checks to guarantee high reliability of this apparatus. The zinc-oxide resistors represent the components that can prejudice considerably the reliability of surge arresters; therefore it is very important to pay particular attention to the checks that are carried out on the above mentioned elements during the construction and assembly phases. The paper, after a concise description of the construction phases of zinc-oxide surge arresters, and particularly of nonlinear resistors, discusses the main manufacturing defects of the arresters. The critical examination of the routine and acceptance tests of the IEC standard under preparation are able to evidence only a part of the above mentioned defects. Therefore user actions are described which may be undertaken to prevent the presence of defective components within each supply. (Edited author abstract) In Italian. 7 refs.

**075616 EINE NEUE DARSTELLUNGSMETHODE FUER MONOKLINISCHES SILBER(I,II)OXID (AgO), EINKRISTALLZUECHTUNG UND ROENTGEN-STRUKTURANALYSE.** [New Method of Describing Monoclinic Silver(I,II)Oxide (AgO), Single Crystal Growing and X-ray Structural Analysis]. A new route for the synthesis of monoclinic AgO has been developed, yielding, for the first time, coarse crystalline samples which apparently do not show deviations from the ideal composition. On electrolysis of aqueous AgF solutions, AgO forms at the anode as crystals of  $1.0 \times 0.2 \times 0.05$  mm in size. The crystal structure has been refined using single-crystal diffractometer data. The thermal stability recorded by differential thermal and thermogravimetric analysis techniques is improved over samples prepared previously by chemical oxidation. (Edited author abstract) In German. 9 refs.

**075617 SYNTHESIS, STRUCTURE AND THERMAL REDUCTION BEHAVIOUR OF DELAFOS-SITE-TYPE  $\text{CuRh}_2\text{Al}_{1-x}\text{O}_2$ .** Delafossite-type oxides  $\text{CuRh}_2\text{Al}_{1-x}\text{O}_2$  with  $0 \leq x \leq 1$  have been synthesized and structurally characterized. The temperature range and the mechanistic course of the thermal reduction have been found to be strongly dependent on the composition of the initial materials. As products, elemental copper, thermally metastable Cu-Rh alloys and  $\text{Al}_2\text{O}_3$  are formed. These products represent not only interesting metallic but also potential bimetallic catalysts. (Author abstract) 13 refs.

**075618 ELECTRONIC BEHAVIOR AND CATIONIC DEFECTS IN CUBIC TRANSITION METAL OXIDES.** A comparison study has been made between the cubic monoxides and oxide spinels of iron, manganese, and cobalt in terms of cation defect structures and electrical properties. Although all six oxides share close-packed oxygen sublattices and have similar point-defect structures, there are considerable differences between conduction processes. Whether or not an octahedral/tetrahedral cation exchange reaction occurs may play a central role in governing conduction. In the iron oxides, n-type small polaron conduction takes place with small hopping energies (0.11-0.16 eV) between octahedral  $\text{Fe}^{2+}$  and  $\text{Fe}^{3+}$ , with the cation inter-site reaction playing a dominant role. Very different behaviors are observed in the spinels and monoxides of manganese and cobalt. Inter-site exchange is highly unlikely in these materials. Instead, disproportionation on the octahedral sites results in p-type small polaron conduction with larger hopping energies (0.25, 0.79 eV) between octahedral  $\text{M}^{4+}$  and  $\text{M}^{3+}$  in the spinels of cobalt and manganese. **Chlorination**

**075619 CARBOCHLORINATION OF DISPERSED OXIDES IN A MOLTEN SALT REACTOR.** Reaction mechanism and rates were determined from 803 to 1,073 K for the carbochlorination of  $\text{Al}_2\text{O}_3$  and of Al, Si and Fe-mixed oxides using  $\text{Cl}_2$  and C slurried in a stirred melt of  $\text{NaCl-AlCl}_3$ . Alumina chlorination rates of  $0.33-2.0 \times 10^{-8}$  kmol/s were obtained using C-melt weight ratios between 1:21 and 1:42. The reaction rate was proportional to C loading at temperatures below 923 K, while gas-liquid mass transfer was rate-controlling at higher temperatures. Carbochlorination of the combined oxides in coal fly ash at 923 K and oxide conversion less than about 50 percent was also gas-liquid mass-transfer-controlled. At higher conversions, dissolution became the rate-controlling factor. A 40 percent (molar)  $\text{AlCl}_3$  melt was more effective than a 48 percent  $\text{AlCl}_3$  melt for the selective chlorination of  $\text{Al}_2\text{O}_3$  over  $\text{SiO}_2$ . (Author abstract). 16 Refs.

**Crystalline**

**075620 HIGH-TEMPERATURE CHARGE-DENSITY STUDIES OF  $\text{CeO}_{2-x}$  USING X-RAY AND NEUTRON DIFFRACTION TECHNIQUES.** High-resolution Bragg scattering experiments have been used to study the structure of polycrystalline  $\text{CeO}_{2-x}$ . The in-situ experiments were carried out as a function of temperature ( $300 < T < 1500$  K). The composition was controlled by flowing gases ( $\text{CO}/\text{CO}_2$  or  $\text{Ar}/\text{O}_2$  mixtures) over the sample. The results of both X-ray and neutron scattering experiments are used to define the principle atomic defects responsible for nonstoichiometry in  $\text{CeO}_{2-x}$ . Large lattice relaxation effects are observed whose magnitudes increase with increasing defect concentration. Temperature-dependent studies of the stoichiometric state ( $x = 0$ ) show that lattice anharmonic interactions are important. The symmetry of the lattice anharmonic interactions is the same as the static displacements observed in the nonstoichiometric state. Thus, we propose that lattice anharmonic interactions are the fundamental driving force for the complex strain interactions observed in the nonstoichiometric state. (Author abstract) 44 refs.

**Crystallization**

**075621 SPECIAL FEATURES OF THE CRYSTALLIZATION OF  $\text{CaLaAlO}_4$ .** On the basis of an analysis of the processes occurring at the crystal/melt interface, it is shown that ahead of the crystallization front in the melt a diffusion layer enriched with calcium oxide or lanthanum oxide forms as a result of the kinetic processes in the

adsorption and diffusion layers. A theoretical fusibility diagram of the  $\text{CaO-La}_2\text{O}_3\text{-Al}_2\text{O}_3$  system is constructed on the basis of a model of regular and ideal solutions. A comparison of the fusibility diagram and the maximum deviations from stoichiometry of  $\text{CaLaAlO}_4$  at the crystallization front of this compound shows that they correspond to the eutectic line bounding its primary-crystallization field. 7 refs. **075622 ANISOTROPY OF COLOUR PROPERTIES IN  $\gamma\text{-Mo}_4\text{O}_{11}$ .** It is known that  $\gamma\text{-Mo}_4\text{O}_{11}$  with orthorhombic structure in a quasi-two-dimensional conductor exhibits a charge-density-wave transition at 95K. We were able to prepare a  $\gamma\text{-Mo}_4\text{O}_{11}$  single crystal of fairly large size by a process of crystal growth in the Cu-Mo-O system, and found that it had two types of cleavage plane with different colors. In this letter, we report the preparation method and anisotropic color properties of  $\gamma\text{-Mo}_4\text{O}_{11}$  single crystal. The reflection spectrum of  $\gamma\text{-Mo}_4\text{O}_{11}$  for linearly polarized light depends on the orientation of crystal. The anisotropy is probably due to the anisotropy of the inter-band transition probability. 5 refs.

**075623 WUESTIT IN OXIDSCHICHTEN AUF NIEDRIG-LEGIERTEN STAELHEN IN WASSERDAMPF. II: WUESTITZERSETZUNG.** [Wuestite in Oxide Layers on Low-Alloy Steels in Water Vapour. II. Decomposition of Wuestite]. The decomposition of wuestite in oxide layers on low-alloy steels formed in water steam at  $T > 600^\circ\text{C}$  was investigated. The mechanism of the decomposition reaction was analysed by studying the microstructure and phase composition of differently quenched wuestite samples and of samples which had been treated at a constant temperature below  $600^\circ\text{C}$ . The decomposition of wuestite into the stable phases magnetite and  $\alpha$ -iron lead to a characteristic decomposition microstructure which makes the identification of originally present wuestite clearly possible, even after the complete transformation of this wuestite into the stable phases. **Defects**

**075624 DIFFUSION OF OXIDE ION VACANCIES IN PEROVSKITE-TYPE OXIDES.** In order to elucidate the diffusion of oxide ion vacancies in perovskite-type oxides, we determined the tracer diffusion coefficient of oxide ions,  $\text{D}_\text{O}^*$ , in  $\text{La}_{1-x}\text{Sr}_x\text{CoO}_{3-\delta}$  ( $x = 0.1$ ) and  $\text{La}_{1-x}\text{Sr}_x\text{FeO}_{3-\delta}$  ( $x = 0.1, 0.25$ , and  $0.4$ ) single crystals. The correlation factor,  $f$ , for a vacancy diffusion mechanism in a perovskite-type anion sublattice was calculated to be  $f = 0.69$  using this value and the nonstoichiometry data, the diffusion coefficient of oxide ion vacancies,  $\text{D}_\text{V}$ , was estimated. It was found that  $\text{D}_\text{V}$  in  $\text{La}_{1-x}\text{Sr}_x\text{MO}_{3-\delta}$  ( $\text{M} = \text{Co, Fe}$ ) take similar values in their magnitude and activation energy. It was concluded that a point defect model holds for the vacancy diffusion in these oxides. The diffusivity of oxide ions in the perovskite-type oxides was comparable to that in fluorite-type oxides. **075625 INTERDIFFUSION IN A QUASI-BINARY  $\text{Al}_2\text{O}_3\text{-Mn}_3\text{O}_4$  SYSTEM IN AIR.** Interdiffusion coefficients of the quasi-binary  $\text{Al}_2\text{O}_3\text{-Mn}_3\text{O}_4$  system in air have been studied at temperatures from 1573 to 1773K. The diffusion couple consisted of a single crystal  $\text{Al}_2\text{O}_3$  whose (012) plane of trigonal lattice was placed in contact with a sintered polycrystalline  $\text{Mn}_3\text{O}_4$ . Master curves of concentration penetrations in the direction of diffusion were obtained at each experimental temperature. Interdiffusion coefficients were calculated by the Matano-Boltzmann method. The reaction mechanism in this system and the crystal structure of diffusion layer are discussed. (Edited author abstract) 10 refs.

**075626 ELECTROLYTIC GROWTH AND DISSOLUTION OF OXIDE LAYERS ON SILICON IN AQUEOUS SOLUTIONS OF FLUORIDES.** The growth and dissolution of oxide layers on silicon has been studied under illumination and in the dark by analyzing current transients at different voltages in solutions of  $\text{NH}_4\text{F}$  of various concentrations at pH values between 1 and 4.5. When the oxidation rate of the silicon at high enough anodic bias and, for n-type specimens, high enough illumination intensity exceeds the rate of oxide dissolution in the fluoride, the film grows until it has reached a thickness where the dissolution is rate-determining for the net process. At higher voltages the current begins to oscillate. The data give some insight into the composition of the oxide layers and their electronic and ionic properties. (Author abstract) 11 refs.

**075627 INFLUENCE OF OXIDE BOND ENERGIES ON THE KINETICS OF CHEMICAL DISSOLUTION OF ANODIC OXIDES ON VALVE METALS.** The influence of M-O bond energies on the kinetics of the chemical dissolution of anodic oxide films on valve metals was analyzed and the different profiles of atomic defects in these oxides were deduced. Four different equations describing the dissolution behavior of such oxides were derived and the respective examples justifying each equation were also introduced. For many oxides, M-O bond energy was found to vary linearly with the activation energy of the dissolution. It was also found that the dissolution rate increases with increase of the initial thickness of the oxide. The dissolution processes were followed by using potential and capacitance measurements. (Author abstract). 23 Refs.

**075628 DECOMPOSITION BEHAVIOURS OF DOPANT-FREE AND DOPED SOLID SOLUTIONS IN THE  $\text{TiO}_2\text{-SnO}_2$  SYSTEM.** Decomposition behaviours, including phase separation by the spinodal mechanism, were investigated for selected compositions of  $x = 0.7, 0.5$  and  $0.3$  in  $\text{Ti}_x\text{Sn}_{1-x}\text{O}_2$  alloy. Inside the coherent spinodal, an equimolar alloy was found to decompose most rapidly at 1100°C and the decomposition rate decreased as the annealing temperature increased. The

difference in the rate of decomposition outside the spinodal between  $x = 0.7$  and  $x = 0.3$  alloys suggested that the ionic mobility of diffusing tin was much slower than that of titanium in the alloy system. The effect of some dopants on the decomposition rate was also examined. Doping with tungsten or antimony atoms strongly suppressed the phase separation both inside and outside the spinodal, especially resulting in a prolonged stabilization of  $x = 0.7$  alloy. The role of the dopants in affecting the decomposition rate is discussed in relation to selective substitution of the doping atoms in the tin or titanium sublattice. (Author abstract) 16 refs.

**075629 ALTERNATING CURRENT ELECTRICAL PROPERTIES OF EVAPORATED CERUM DIOXIDE FILMS.** Alternating current measurements are described for amorphous  $\text{CeO}_2$  thin film metal-insulator-metal samples prepared by vacuum evaporation. The behavior of the ac conductivity  $\sigma(\omega)$  is similar to the earlier observations for many other types of amorphous semiconductors, which obey an equation of the form  $\sigma(\omega) = A\omega^s$ ,  $\omega$  being the radial frequency and the index  $s$  having different values at different temperatures. The conduction process involves the hopping of electrons or polarons. The Elliott (1977) model satisfactorily accounts for the frequency dependence of conductivity and the temperature dependence of  $s$ . The capacitance of the sample shows an increase with increasing temperature certainly in the lower frequency range. (Author abstract) 13 refs.

Al-Dhhan, Z.T. (Brunel Univ, Uxbridge, Engl); Hogarth, C.A. *Int J Electron* v 63 n 4 Oct 1987 p 573-585.

**075630 MIXED IONIC-ELECTRONIC CONDUCTIVITY OF  $\text{La}_{1-x}\text{Sr}_x\text{Co}_{1-y}\text{Fe}_y\text{O}_{3-\delta}$  PEROVSKITE-TYPE OXIDES.** The ionic ( $\sigma_i$ ) and electronic ( $\sigma_e$ ) conductivities of mixed conductive  $\text{La}_{1-x}\text{Sr}_x\text{Co}_{1-y}\text{Fe}_y\text{O}_{3-\delta}$  were separately measured by means of the four-probe ionic dc and ordinary four-probe dc techniques, respectively. At 1073 K, for instance,  $\sigma_i$  ranged from  $1$  to  $10 \cdot 2 \text{ S cm}^{-1}$ , while  $\sigma_e$  was around  $10^2 \text{ S cm}^{-1}$ , indicating that these oxides were good mixed conductors with ionic transport numbers  $10^{-2}$  -  $10^{-4}$ .  $\sigma_i$  increased as the contents of Sr and Co increased although the Sr content had a greater effect. The apparent activation energy for oxide ion conduction, as well as the dependences of  $\sigma_i$  on oxide composition and oxygen partial pressure, suggested that oxide ion conduction occurred via a vacancy mechanism. The relation of mixed conductivity to the oxygen semipermeability was also discussed. (Edited author abstract) 16 refs.

**075631 ELECTRICAL PROPERTIES AND CATION VALENCIES IN  $\text{Mn}_3\text{O}_4$ .** The electrical conductivity and thermopower of  $\text{Mn}_3\text{O}_4$  were measured in the temperature range 920° to 1530°C. Electrical conduction in cubic  $\text{Mn}_3\text{O}_4$  is explained by the small polaron hopping of electron holes between  $\text{Mn}^{4+}$  and  $\text{Mn}^{3+}$  on octahedral sites. The concentrations of  $\text{Mn}^{4+}$  and  $\text{Mn}^{3+}$  are governed by the disproportionation equilibrium  $2\text{Mn}_{\text{Oct}}^{3+} \rightleftharpoons \text{Mn}_{\text{Oct}}^{4+} + \text{Mn}_{\text{Oct}}^{2+}$ . This model also explains the electrical behavior of  $\text{NiMn}_2\text{O}_4$  and  $\text{CuMn}_2\text{O}_4$ . (Author abstract) 50 refs.

**075634 ELECTRICAL AND PHYSICAL CHARACTERISTICS OF THIN NITRIDED OXIDES PREPARED BY RAPID THERMAL NITRIDATION.** Ultrathin oxides (5-12 nm) were nitrided by lamp-heated rapid thermal annealing in ammonia at temperatures of 900-1150°C for 5-300 s. Elemental depth profiles were measured by Auger electron spectroscopy (AES) and secondary ion mass spectroscopy (SIMS). Both the nitrogen concentration, measured by AES, and that hydrogen, measured by SIMS, for a nitrided oxide, are found to increase monotonically as nitridation proceeds. The AES depth profiles of oxygen show that the Si-SiO<sub>2</sub> interface does not move during nitridation. Dependences of midgap interface state density ( $D_{\text{itm}}$ ) and fixed charge density ( $N_f$ ) on nitridation temperature and on oxide thickness were studied. For a given temperature, both  $D_{\text{itm}}$  and  $N_f$  are found to show turnarounds as nitridation time increases in a similar manner: at first both increase, reach respective maxima at a certain nitridation time  $t_{\text{max}}$ , and then decrease gradually. The maximum of  $D_{\text{itm}}$  increases as the oxide film is thinner. A two-step model is newly proposed to explain the turnaround behaviors of  $D_{\text{itm}}$  and  $N_f$ : the first step is defect formation as a result of nitrogen incorporation, and the second step is reduction of the defects by an annealing-type process. The simulation reproduces the turnaround behaviors very well. 23 refs.

**075636 EXCELLENT CHARGE-TRAPPING PROPERTIES OF ULTRATHIN REOXIDIZED TRITRIDE OXIDES PREPARED BY RAPID THERMAL PROCESSING.** 7.7-nm-thick oxide nitrided at 950°C and 1150°C for 60 s were reoxidized by rapid thermal processing in dry oxygen at 900-1150°C for 15-200 s. The nitridation-condition and reoxidation-condition dependences of charge to breakdown ( $Q_{BD}$ ), flat-band voltage shift ( $\Delta V_{FB}$ ), and increase of midgap interface state density ( $\Delta D_{itm}$ ) under high-field stress were studied. Rapid reoxidation achieves striking improvement of dielectric integrity: the  $Q_{BD}$  is improved by about 16 times and both the  $\Delta V_{FB}$  and  $\Delta D_{itm}$  are reduced by more than two orders of magnitude compared with those of thermal oxides. A correlation between the improvement and a reduction of hydrogen concentration by reoxidation is found. 13 refs.

**075637 SATELLITE STRUCTURES IN THE X-RAY PHOTOELECTRON SPECTRA OF SURFACE OXIDES FORMED ON FeTi ALLOYS.** Satellite structures have been observed adjacent to the main peaks in the X-ray photoelectron spectra of metal core levels, Ti(2p) and Fe(2p), as well as in the ligand core level, O(1s), of the surface oxides present on the FeTi alloys. These satellites have been interpreted in terms of charge transfer transitions (shake-up process). The satellites of the metal and ligand tend to be mutually exclusive, a behavior that can be understood on the basis of metal-ligand overlap; this behavior gives valuable clues to the nature of metal-ligand bonding. Based on this information, the deactivation and the difficulties involved in the reactivation of FeTi alloy toward better hydrogen sorption characteristics have been considered. ## Friction

**075638 TRIBOLOGICAL PERFORMANCE OF  $\text{MoS}_2$  COMPACTS CONTAINING  $\text{MoO}_3$ ,  $\text{Sb}_2\text{O}_3$  OR  $\text{MoO}_3$  AND  $\text{Sb}_2\text{O}_3$ .** Selected oxides and sulfides have been previously investigated as bulk additives to enhance the tribological performance of  $\text{MoS}_2$  in air from ambient temperature to about 315°C.  $\text{Sb}_2\text{O}_3$ , in particular, has been identified as a superior additive for high temperature aerospace applications. In experiments designed to investigate a hypothesis that the superior tribological performance of  $\text{MoS}_2$ - $\text{Sb}_2\text{O}_3$  formulations results from formation of an  $\text{Sb}_2\text{O}_3$ - $\text{MoO}_3$  eutectic, compacts of  $\text{MoS}_2$  with

$\text{MoO}_3$ ,  $\text{Sb}_2\text{O}_3$  or  $\text{MoO}_3$  and  $\text{Sb}_2\text{O}_3$ , were prepared and tribologically evaluated at 316°C. Formulations containing  $\text{Sb}_2\text{O}_3$  or  $\text{MoO}_3$  resulted in higher friction but much less wear than  $\text{MoS}_2$  compacts, with the wear volume of  $\text{MoS}_2$ - $\text{MoO}_3$  compacts at about half that of compacts containing  $\text{Sb}_2\text{O}_3$ . (Edited author abstract) 10 refs.

**075639 HIGH-TEMPERATURE TREATMENT OF SILICA-CONTAINING OXIDES.** Experimental data on the effect of thermal and thermal-vapor treatment on the texture and phase composition of coprecipitated  $\text{SiO}_2$ - $\text{TiO}_2$ ,  $\text{SiO}_2$ - $\text{ZrO}_2$ ,  $\text{SiO}_2$ - $\text{SnO}_2$  compositions of varying composition are presented and discussed. The difficulty crystallizing component, silicon dioxide, hinders the texture and phase transformations of  $\text{TiO}_2$ ,  $\text{ZrO}_2$ , and  $\text{SnO}_2$ , as a result of which coprecipitated materials retain high dispersion up to higher temperatures than do pure titanium, zirconium, and tin dioxides, the crystallization temperature of which also significantly increases. The accelerating effect of water vapor on aging of the examined complex oxides was shown. (Author abstract) 15 refs.

**075641 INFLUENCE OF WATER ON STRUCTURE AND IONIC CONDUCTION OF PHYLLOMANGANATES (IV).** The variation of cell parameters and ac conductivity with hygrometry and temperature were measured on powders of the layered manganates  $\text{Na}_4\text{Mn}_{14}\text{O}_{27} \cdot z\text{H}_2\text{O}$ ,  $\text{KMn}_5\text{O}_{10} \cdot z\text{H}_2\text{O}$  and  $\text{Mn}_{14}\text{O}_{25} \cdot z\text{H}_2\text{O}$ . They all lose quantitatively water below approximately 120°C with lattice concentration in the direction normal to the layers. DTG (differential thermogravimetry) shows that samples kept in air contain adsorbed and structural (interlayer) water. The conductivity is strongly dependent on the water partial pressure below 80°C. Above 100°C, the conductivity is probably electronic with activation energies 0.32-0.40 eV, in agreement with their mixed-valence character. (Edited author abstract) 24 refs.

**075642 NONLINEAR ELECTRICAL PROPERTIES OF GRAIN BOUNDARIES IN AN OXYGEN-ION CONDUCTOR ( $\text{CeO}_2$ - $\text{Y}_2\text{O}_3$ ).** The ceria-yttria solid solution is a good anionic conductor. In polycrystalline ceramics, the complex impedance spectroscopy

copy shows clearly the existence of a significant additional resistance associated with the grain boundaries. In this paper a theoretical analysis of the ac response in the nonlinear regime is developed. In particular the current-voltage and capacitance-voltage characteristics of the grain boundaries are derived. For the material investigated the former is well fitted by the Poole-Frenkel law while the capacitance is voltage independent. (Author abstract) 14 refs.

**075643  $\text{HfNbWO}_6$  AND  $\text{HTaWO}_6$ : NOVEL LAYERED OXIDES RELATED TO THE RUTILE STRUCTURE. SYNTHESIS AND INVESTIGATION OF ION-EXCHANGE AND INTERCALATION BEHAVIOUR.** New protonated layered oxides,  $\text{HMWO}_6 \cdot 1.5\text{H}_2\text{O}$  ( $M = \text{Nb}$  or  $\text{Ta}$ ), have been synthesized by topotactic exchange of lithium in trirutile  $\text{LiMWO}_6$  with protons by treatment with dilute  $\text{HNO}_3$ . Partially hydrated compounds,  $\text{HMWO}_6 \cdot 0.5\text{H}_2\text{O}$  and anhydrous compounds,  $\text{HMWO}_6$  retain the layered structure. The structure of these oxides consists of  $\text{MWO}_6$  sheets built up of M/W-oxygen octahedra with rutile type corner- and edge-sharing. Interlayer protons in  $\text{HMWO}_6$  are exchanged with  $\text{Li}^+$ ,  $\text{Na}^+$ ,  $\text{K}^+$  and  $\text{Ti}^+$ .  $\text{HMWO}_6$  exhibit Bronsted acidity intercalating n-alkylamines and pyridine. (Edited author abstract) 25 refs.

**075644 ELECTRICAL PROPERTIES AND MICROSTRUCTURE IN THE SYSTEM CERIA-ALKALINE EARTH OXIDE.** Solid electrolytes with a high ionic conduction of oxygen have been attracting great interest for application in high-temperature fuel cells and oxygen sensors. In the present paper, the electrical conductivity and ionic transference number of the ceria-alkaline earth oxide systems are investigated and discussed in terms of the crystal structure, density, and microstructure. Undoped ceria and its solid solution with alkaline earth oxides have a cubic fluorite structure. The ionic conductivity of ceria is greatly enhanced by additions of ceria and strontia, even when they are added in excess of the solubility limit. The conductivities of ceria-calcia and ceria-strontia were much higher than those of ceria- and yttria-stabilized zirconia. Up to the limit of ceria and strontia, the ionic transference number was nearly unity in the temperature range between 600 and 900°C. With an increase in ceria and strontia content, the ionic conductivity was little affected by the presence of a second phase of  $\text{CaO}$  and  $\text{SrCeO}_3$ . **075647 INNOVATIONS AND DEVELOPMENTS IN OXIDE PRODUCTION FOR LEAD/ACID BATTERIES.** The lead oxide manufacturing process has been known since the second half of the nineteenth century. After the lead/acid battery ceased to be a mere scientific curiosity at the turn of the century, the fast-growing demands for storage batteries by industry in general, and by the automotive industry in particular, motivated further development of the traditional process for lead oxide production. Nowadays, over 30% of the total world production of lead oxide is converted into plate material for lead/acid batteries. Of the numerous patented processes, only three basic methods have survived, and these have been further developed by various companies worldwide. These processes are reviewed in this paper.

## Mathematical Models

**075648 SOME ASPECTS IN PREDICTING THE POINT OF ZERO CHARGE OF A COMPOSITE OXIDE SYSTEM.** Discrepancies exist among several recently published correlations between the point of zero charge (PZC) of a composite oxide system and those of its component oxides. In this paper, theoretical background and physical meaning for the PZC of a composite oxide were given. Plausible explanations were provided to clarify the differences among the publications. A set of experiments was also carried out for comparison, to determine the PZC of a mechanical mixture of alumina and silica oxides. Suggestions regarding prediction of PZC of a composite oxide system were made. (Author abstract) 12 refs.

**075650 SELECTIVE SOLAR ABSORPTION OF OXIDE FILMS GROWN IN SITU ON Fe-, Ni-, AND Cu-BASE ALLOYS.** In situ films were formed over a range of temperature, time, and oxygen pressure on two iron-base alloys, and nine copper-base alloys. A variety of oxide scales were obtained which included single-phase oxides doped with the alloying additions, multiple oxides of the base metal, and duplex oxides of either the base metal and mixed oxides of the base metal a solute-metal oxides. Solar absorbance, hemispherical-spectral reflectance, and emittance were measured. Oxides on iron-base alloys had absorbances  $> 0.80$  and high emittances ( $> 0.50$ ) and were relatively insensitive to doping effects. Elimination of the outer layer of  $\text{Fe}_2\text{O}_3$  by low-pressure oxidation of Fe-Mn alloys had little effect on spectra selectivity. The emittance of oxides on nickel-base alloys was markedly decreased by doping, but absorbances were virtually unchanged and still too low, i.e., 0.80-0.84, for selective absorption. Copper-base alloys formed very low emittance oxides but absorbances were also low ( $< 0.80$ ). The efficacy of the films as selective absorbers and the mechanism of spectral selectivity are discussed. The tandem-stack model appears to best fit the observations. (Author abstract) 13 refs.

## Oxidation

**075651 VOLTAMMETRIC INVESTIGATIONS OF THE OXYGEN ELECTROCHEMICAL SYSTEMS IN MOLTEN SODIUM NITRATE AT 420°C.** A reaction pathway for the electrochemical oxidation of oxide anions at a platinum electrode in molten  $\text{NaNO}_3$  was deduced from the analysis of cyclic voltammograms. The mechanism involves one diffusion step followed by a charge transfer step, leading to a primary intermediate adsorbed oxygen species  $[\text{O}(-1)]$  which, in another step, disproportionates into a second intermediate adsorbed oxygen species  $[\text{O}_{\text{ads}}]$ , which further desorbs as  $\text{O}_2(\text{g})$ , and oxide ions. These latter are thus regenerated by catalytic process. (Author abstract) 15 refs.

**075652 SPECIFIC POINTS ON SPINEL PHASE DIAGRAMS.** On phase diagrams of some oxides there exist isolated transition points in the vicinity of which  $N$  ( $N > 3$ ) phases are in equilibrium. A typical description of phase transitions in the vicinity of an N-phase point is confined to the analysis of some non-equilibrium thermodynamic potential invariants in relation to the group of high-symmetry phase transformations. Minima of this potential correspond to possible low-symmetry phases. The note suggests a new method of qualitative construction of phase diagrams containing N-phase points. 21 Refs.

**075654 CALCULATION OF PHASE DIAGRAMS OF SOME OXIDE SYSTEMS USING THE CLUSTER VARIATION METHOD.** For calculating phase diagrams of mineral/ceramic systems, the cluster variation method CVM is a useful tool. The CVM is a hierarchy in which the approximations based on point- and pair-clusters correspond to the Bragg-Williams and Bethe approximations, respectively. The  $\text{CaCO}_3\text{-MgCO}_3$  system was successfully treated as a trigonally distorted fcc-based system, in an anisotropic tetrahedron approximation. The  $\text{Fe}_2\text{O}_3\text{-FeTiO}_3$  system was treated as a derivative of the simple hexagonal lattice in which permanent vacant sites occupy 1/3 of the lattice sites; a triangular prism was used as the basic cluster. Although the CVM was originally developed to study alloy systems, we find that it yields quite reasonable results for these more complicated mineral/ceramic systems, even though we use highly simplified ad hoc parameterizations for the internal energy. (Edited author abstract) 20 refs.

## Physical Chemistry

**075657 PHYSICO-CHEMICAL PROPERTIES AND CATALYTIC BEHAVIOR OF MANGANESE OXIDES.** Two series of manganese oxides have been prepared by the thermal decomposition of manganese carbonate and oxalate under vacuum (300-900°C temperature). The kinetics of aqueous  $H_2O_2$  decomposition on these oxide surfaces have been studied. The reaction was found to be first order with respect to  $[H_2O_2]$ . Catalytic activities were found to be decreasing with the increasing temperature of decomposition. X-ray diffraction studies of the powdered samples show that the samples contain mainly two types of structures,  $NaCl(MnO)$  and calcinite ( $Mn_3O_4$ ). Infrared spectra show a characteristic band at  $796\text{ cm}^{-1}$  for the sample obtained by the decomposition of both Mn oxalate and Mn carbonate at 750 and 900°C. Samples prepared at other temperatures show similar characteristic bands. (Edited author abstract) 14 refs.

## Polymerization

**075658 POLYMERIZATION OF EPOXIDES CATALYZED BY THE TITANIUM TETRAISOPROPOXIDE/PHENOL SYSTEM AND ITS MECHANISM.** Although the polymerization of epoxides catalyzed by titanium alkoxides has been reported, the mechanism is still unknown. The authors' examination of this process revealed that cyclohexene oxide gave a polymer in a very low yield in the presence of a catalytic amount of titanium tetraisopropoxide. This result is probably because the Lewis basicity of the epoxide is too weak to facilitate its coordination to the metal center of the weak Lewis acid titanium tetraisopropoxide. They now find that the addition of phenol to titanium tetraisopropoxide causes a remarkable effect on the polymerization of epoxides and that the phenoxy and isopropoxy groups play distinct roles for initiating the polymerization. 1 Ref.

**075660 INCONGRUENT SPUTTERING IN METAL OXIDES.** Incongruent sputtering of  $NiO(100)$

and  $CoO(100)$  single crystals is observed for elevated substrate temperatures and 2 keV  $Ar^+$ . The sputtering process, which is three dimensional in nature, involves a balancing of oxygen diffusion into the near-surface region with that of oxygen and metal sputtering yields. Evidence is given that diffusion is ion enhanced and that defect or interstitial oxygen species participate in the preferential sputtering process. Based on the data reported, a mechanism is proposed that does not rely upon thermal sputtering and treats the incident ion as the initiator of typical linear cascade events. 36 refs.

**075663 MECHANISM OF COMBINED REDUCTION OF IRON AND CHROMIUM IN A QUASI-BINARY OXIDE SYSTEM.** Combined reduction of chromium and iron in a quasi-binary oxide system occurs via the formation of a carbide phase and its subsequent destruction as a result of a reaction with chromium oxide prior to the formation of a solid solution of chromium in iron. Chromium oxide is reduced to a complex trigonal carbide simultaneously with the reduction of wustite. The reduction of ferrochromite with the formation of chromium carbides occurs without prior decomposition of  $FeCr_2O_4$  into individual oxides. The start of the reduction of chromium to the metal and its dissolution in iron is characterized by the reduction of a considerable part of the iron. An increase in the period of the iron lattice confirms the formation of a solid iron-chromium solution of interstitial type. In Russian. 5 refs.

**075665 USE OF  $^{18}O$ /SIMS AND ELECTROCHEMICAL TECHNIQUES TO STUDY THE REDUCTION AND BREAKDOWN OF PASSIVE OXIDE FILMS ON IRON.** Secondary ion mass spectrometry (SIMS) has been used to study the cathodic removal and open-circuit breakdown of passive oxide films formed on Fe in  $^{18}O$ -enriched borate buffer solution. For film removal by galvanostatic cathodic reduction, the initial stage of reduction resulted in a layer by layer thinning of the film. The rates of film removal with cathodic charge passed were determined to be 1.56 and  $0.30\text{ nm/MC cm}^{-2}$  during the two distinct stages of reduction. These results are analyzed in terms of the various models for the passive film on Fe. Immersion of the passivated Fe electrodes in acidic sulfate solutions on open circuit resulted in a distinct potential arrest followed by a very rapid potential decrease. (Edited author abstract) 15 refs.

**075666 XPS AND REDUCTION STUDY OF  $PrCoO_3$ .**  $LaCoO_3$  exhibits the highest catalytic activity for oxidation of CO, propene and isobutene within the series of  $LaMO_3$  oxides (M, first-row transition metal). This catalytic activity should be higher for  $PrCoO_3$  since the oxygen binding energy in this oxide is lower than that for  $LaCoO_3$ . In this work attention is paid to the reactivity of oxygen in the praseodymium-cobalt perovskite. By means of X-ray photoelectron spectroscopy (XPS), two different types of oxygen were identified and their evolution in the reduced sample was studied. Also gravimetric measurements of reduction at programmed temperature and in isothermal conditions were carried out. These results are compared with those of  $LaCoO_3$  and some considerations about the role of the cation in the A position of the perovskite structure are made. 25 refs.

**075667 KINETIC STUDY OF COBALT OXIDES REDUCTION BY HYDROGEN.** In spite of the wide utilization of cobalt as an active phase in various heterogeneous catalytic systems, some aspects related to the preparation stages of these metal catalysts have not been given much attention. Such is the case of the kinetics and mechanisms of reduction of the oxides to metal. The kinetics of  $Co_3O_4$  and  $CoO$  reduction with hydrogen was studied in a fixed bed differential reactor under temperatures ranging from 600 to 800 K and hydrogen partial pressures ranging from 0.25 to 0.6 atm. Kinetic parameters were calculated from thermal conductivity variations measured in the gaseous phase during reaction. The results obtained were analyzed in relation to the kinetic models existing in current literature and it was found that in all cases the system has a first order behaviour in relation to hydrogen partial pressure according to an interlocked straight cylindrical pore geometry in the solid phase. 12 refs.

**075668 EFFECT OF CRYSTALLITE SIZE ON OXIDATION AND REDUCTION BEHAVIOR OF A MANGANESE-SUBSTITUTED MAGNETITE OF COMPOSITION  $Mn_{0.67}Fe_{2.33}O_4$ .** Thermogravimetry and electrical conductivity were used to determine the

effect of crystallite size on oxidation and reduction behavior of a manganese substituted magnetite  $Mn_{0.67}Fe_{2.33}O_4$  containing several oxidizable cations. We have found that within the single-phase region of the spinel (below 550°C) oxidation and reduction temperatures increase with increase of particle size. A quantitative analysis of cations suggests that there exists a grain size of 45 nm above which the oxidation characteristics of three oxidizable cations ( $Fe^{2+}$ ,  $Mn^{3+}$ ,  $Mn^{2+}$ ) change. Above 600°C, the temperature of structural change spinel  $\rightarrow$  corundum increases with decrease in particle size owing to stresses at the crystal lattice level. (Author abstract) 9 refs.

**075669 REDUCTION OF TITANIUM-ANTIMONY OXIDES IN HYDROGEN AND IN CARBON MONOXIDE.** The reduction of coprecipitated titanium-antimony oxides by hydrogen and carbon monoxide has been investigated. The results show that the selective oxidation of hydrogen or carbon monoxide by antimony in titanium-antimony oxides is dependent on the temperature, the nature of the matrix and the extent of catalyst reduction. The oxidation of hydrogen, as compared to carbon monoxide, at moderate temperatures is strongly favoured by solids composed of low concentrations of antimony in the rutile lattice and subjected to limited overall reduction. The results may be associated with the use of such materials as selective hydrocarbon oxidation catalysts. (Author abstract). 4 Refs.

## Solubility

**075670 SOLUBILITY OF BARIUM OXIDE IN ZINC OXIDE.** The ZnO-BaO system is a potential electronic material; a sintered body shows a varistor characteristic and large grains prepared in this system can be applied for the production of low-voltage varistors. Apart from this application, very little is known of its basic characteristics. This letter reports the solubility of BaO in ZnO which is important for further development of the system. Chemical analysis was used to determine solubility. The method is based on the unique two-phase microstructure of the system. 5 refs.

**075671 TERMINAL SOLID SOLUBILITIES AT 1313K IN THE SYSTEM CALCIUM OXIDE-NICKEL OXIDE USING A SOLID STATE GALVANIC CELL.** The present work was undertaken to determine the terminal solid solubilities at 1313K using  $CaF_2$  as the solid electrolyte. The solid solubilities of CaO in NiO and NiO in CaO are found to be 2.0 and 1.3 mol%, respectively. X-ray powder patterns of the samples quenched from 1313K confirmed the phase changes obtained from the e.m.f. work. The very high positive deviation from ideality exhibited in the isostructural system CaO-NiO is to be expected in view of the appreciable cationic size disparity leading to positive strain energy in the crystal structure. 8 refs.

**075672 OXYGEN AUGER SPECTRA OF SOME TRANSITION-METAL OXIDES: RELAXATION ENERGIES AND d-BAND SCREENING.** A number of transition-metal oxides have been investigated by ESCA and special attention has been paid both to the valence band and to the oxygen Auger spectra. Lang and Williams' Auger parameters have been calculated and the

results show that large screening effects, attributable to the metal d band, take place provided the d band is not separated from the actual valence band. In spite of this important extra-atomic relaxation, there is a strong evidence for hole localization in the oxygen Auger final states. Both hole localization and screening effects explain the quasi-atomic nature of the O KLL transitions. (Author abstract) 29 refs.

**075673 X-RAY AND SPECTROSCOPIC STUDIES OF MECHANICALLY TREATED FOR IRRADIATED OXIDES.** Results on the kind and distribution of structural defects in quartz ( $SiO_2$ ) and periclase ( $MgO$ ) after mechanical treatment have been presented. Zero-, one-, two- and three-dimensional defects are generated. Mainly surface near regions are distorted, where interactions of the induced defects with the atmosphere are possible. The mechanical energy causes a stronger structural distortion in quartz than in periclase, but the depth of penetration of the distortions is larger in the latter compound. The distribution of the defects depends mainly on the mechanism of treatment; kind, concentration and penetration depth depend on the material-specific features of the substances. (Author abstract) 71 refs.

**075674 X-RAY PHOTOELECTRON SPECTROSCOPY STUDY OF PEROVSKITE-TYPE MIXED OXIDES ( $La_{1-x}A_xCoO_3$ ).** The surface states of the perovskite-type cerium-, thorium- and strontium-doped lanthanum cobalt oxides ( $La_{1-x}Ce_xCoO_3$ ,  $La_{1-x}Th_xCoO_3$ ,  $La_{1-x}Sr_xCoO_3$ ,  $x = 0$  to 0.03) have been investigated using X-ray photoelectron spectroscopy (XPS). From the results, it is expected that the bonding state between the surface cobalt and lattice oxygen is mostly ionic at this point. The valence band (VB) spectra change greatly at  $x = 0.02$  on both cerium- and thorium-doped samples. The change of the VB spectra for  $La_{1-x}Sr_xCoO_3$  near the Fermi level can be explained by the formation of the impurity level. (Edited author abstract) 15 refs.

**075675 AUGER LINE RELATIVE INTENSITIES AS A TOOL FOR THE CHARACTERIZATION OF OXIDES FORMED DURING THE OXIDATION OF SINGLE CRYSTALS OF DILUTE Cu-Mn ALLOYS.** A chemical effect affecting the shape of the copper, manganese and oxygen Auger lines provides a very useful tool for characterization of the oxides formed during high temperature and low pressure oxidation of dilute Cu-Mn alloys. The state of oxidation of these elements changes the electron distribution in the valence bands, and the relative amplitudes of the Auger transitions involving one or two valence levels have been used as a measure of this effect. (Author abstract). 7 Refs.

**075677 OXIDATION OF  $Ni_3Al$  AT LOW AND HIGH OXYGEN PRESSURES.** Oxidation of stoichiometric  $Ni_3Al$  performed at elevated temperatures in low oxygen partial pressure and in atmospheric oxygen has been studied by x-ray photoelectron spectroscopy, auger electron spectroscopy and x-ray diffraction. At low oxidation pressure only the aluminum oxide is found although there is evidence for a phase change at temperatures above 600°C. At atmospheric pressure,  $NiO$ ,  $NiAl_2O_4$  and  $Al_2O_3$  are obtained. The different behavior is discussed in terms of the relative standard free energy of formation of the oxides. **075683 NATURE OF CHEMISORBED SPECIES ON METAL OXIDE SURFACES: ELECTRON TRANSFER AND BOND-BREAKING PROCESSES.** Highly ionic insulator oxides, in particular  $\text{MgO}$ , can be prepared by high surface area form possessing many surface defect sites. The nature of these thermally robust defects are either structural (edges, planes, kinks, cation and anion vacancies) or electronic (electron excess or deficient sites). Extremely basic, electron rich sites are capable of strongly interacting with chemisorbing molecules. Proton abstraction, electron transfer, molecular oligomerization, base condensation, and radical trapping reactions have been observed with various adsorbing organic molecules. Adsorbed species can be readily detected with appropriate spectroscopic tools. Further technological use of thermally activated  $\text{MgO}$  and other oxides appear promising, especially in such areas as selective hydrocarbon H-D exchange catalysts, and destructive adsorbents for air purification purposes. ## Suspensions

**075685 EFFECT OF WATER ON THE ZETA POTENTIAL OF CHROMIUM DIOXIDE IN TETRAHYDROFURAN.** This work is aimed at investigating one component of the magnetic ink which is commonly overlooked, namely water. Experiments have been performed to determine the effect of water on dilute suspensions of  $\text{CrO}_2$  in tetrahydrofuran (THF). The effect of water in the solvent as well as on the particle surface has been investigated using electrokinetic and dispersion stability measurements. Results of these investigations

have shown that the zeta potential of dried  $\text{CrO}_2$  (physically adsorbed water removed) in THF is positive and is dependent on the water content in THF. The zeta potential exhibits a maximum at about 1,800 ppm water. Good correlation also exists between the electrokinetic and dispersion stability measurements. (Edited author abstract) 14 refs.

**075687 PREPARATION AND PROPERTIES OF GLASSY FILMS IN THE  $\text{V}_2\text{O}_5\text{-ZnO}$  SYSTEM.** Rapidly quenched films in a given system were prepared using a twin-roller type apparatus. It was found that glassy films were obtained in a wide range of 0-75 mol% ZnO content, except for the vicinity of 60ZnO-40V<sub>2</sub>O<sub>5</sub> composition. Of four binary compounds, glassy films of  $\text{ZnV}_2\text{O}_6$  and  $\text{Zn}_2\text{V}_2\text{O}_7$  crystallized directly without changing the composition. The other glassy films showed a complicated process. The first crystallization temperature rose with an increase in ZnO content. In addition, the IR-spectral and electrical properties of quenched films were investigated. On the basis of the data, the structural aspect of Zn-vanadate glasses was discussed. (Author abstract) 15 refs.

Tsuzuki, A. (Government Industrial Research Inst, Nagoya, Jpn); Kawakami, S.; Sekiya, T.; Torii, Y.; Ishii, E. *Mater Res Bull* v 22 n 10 Oct 1987 p 1315-1320.

**075688 VANADATE (V) OXIDE WITH PEROVSKITE STRUCTURE:  $\text{La}_2\text{LiVO}_6$ , COMPARISON WITH HOMOLOGOUS  $\text{La}_2\text{LiMO}_6$  PHASES (M = Fe, Nb, Mo, Ru, Ta, Re, Os, Ir).** The  $\text{La}_2\text{LiVO}_6$  oxide with perovskite structure has been prepared under high oxygen pressure. A structural comparison with analogous  $\text{La}_2\text{LiMO}_6$  phases reveals a smaller unit cell than that expected from the variation of the parameters with ionic radii. Such a phenomenon can be accounted for by the  $d^0$  electronic configuration of vanadium (V) and the resulting high ionization potential. (Author abstract) 15 refs.

Demazeau, Gerard (CNRS, Talence, Fr); Oh-Kim, Eunok; Choy, JinHo; Hagemuller, Paul. *Mater Res Bull* v 22 n 6 Jun 1987 p 735-740.

**075689 NEW MODIFICATION OF  $\text{ReO}_3$ -TYPE  $\text{MoO}_3$  AND THE DEUTERATED INTERCALATION COMPOUND FROM WHICH IT IS DERIVED:  $\text{D}_{0.99}\text{MoO}_3$ .** The synthesis of the perovskite form of pure  $\text{MoO}_3$  has opened the door to crystallochemical studies of this compound and its intercalates. Thus far two intercalates (hydrogen/deuterium and lithium), analogous to those found in the  $\text{WO}_3$  and  $(\text{W},\text{Mo})\text{O}_3$  systems, have been prepared. In addition, a second modification, produced via the decomposition of the deuterium bronze, has been identified.  $\beta\text{-MoO}_3$  promises a structural and intercalation chemistry at least as rich and varied as has been described for  $\text{WO}_3$ . 12 refs.

Parise, John B. (DuPont, Wilmington, DE, USA); McCarron, Eugene M. III; Sleight, Arthur W. *Mater Res Bull* v 22 n 6 Jun 1987 p 803-811.

**075690 LOW-TEMPERATURE PREPARATION**

**OF NICKEL AND ZINC COBALTITES.** Solid solutions of metal acetate hydrazines,  $\text{M}_{1/3}\text{Co}_{2/3}(\text{CH}_3\text{COO})_2(\text{N}_2\text{H}_4)_2$ , where M = Ni or Zn, have been investigated as precursors of nickel and zinc cobaltites. These precursors decompose exothermically in the temperature range 165-345°C to yield the corresponding cobaltites. The formation of cobaltites has been confirmed by thermogravimetric weight loss and x-ray diffraction patterns of the decomposition residues. (Author abstract) 15 refs.

Mahesh, G.V. (Indian Inst of Science, Bangalore, India); Patil, K.C. *React Solids* v 4 n 1-2 Oct 1987 p 117-123.

**075691 USE OF THE ALKOXY METHOD TO OBTAIN OXIDE PHASES OF THE  $\text{Fe}_2\text{O}_3\text{-Y}_2\text{O}_3$  SYSTEM.** It is established that the synthesis of oxide powders of the  $\text{Y}_2\text{O}_3\text{-Fe}_2\text{O}_3$  system by the alkoxy method makes it possible to greatly decrease the reaction volumes, the number of operations and their duration in comparison with the method of coprecipitation of oxide hydrates from aqueous solutions of inorganic salts. During heat treatments of the products of hydrolysis of ferric alcohols it is  $\gamma\text{-Fe}_2\text{O}_3$  which crystallizes first, in contrast to what usually forms during precipitation from  $\alpha\text{-FeOOH}$  solutions. Further heat treatment of  $\gamma\text{-Fe}_2\text{O}_3$  leads to the appearance of  $\alpha\text{-Fe}_2\text{O}_3$ . The conditions of crystallization of  $\text{Y}_2\text{Fe}_2\text{O}_{12}$  and  $\text{YFeO}_3$  phases prepared by the two methods and the average size of their crystallites are very similar, but the powders precipitated from alcoholates are more homogeneous. In Russian. 16 refs.

Yanovskaya, M.I.; Rogova, T.V.; Ivanov, S.A.; Kolganova, N.V.; Turova, N.Ya. *Izv Akad Nauk SSSR Neorg Mater* v 23 n 8 Aug 1987 p 1343-1346.

**075692 ZINC-COBALT OXIDE SPINELS WITH PRECURSOR-CONTROLLED DEGREE OF INVERSION.** Zinc-cobalt oxide spinels,  $\text{ZnCo}_2\text{O}_4$ , have been prepared by thermal decomposition of three different precursors: (I) coprecipitated zinc-cobalt hydroxide nitrate; (II) coprecipitated zinc-cobalt hydroxide, and (III) zinc-cobalt hydroxide nitrate prepared by isomorphous replacement of the tetrahedrally coordinated  $\text{Co}^{2+}$  ions in the double-layered parent cobalt hydroxide nitrate by  $\text{Zn}^{2+}$  ions. It has been shown that the cationic distribution in the oxide product is predetermined by the cationic distribution of the precursor. The coprecipitated precursors (I) and (II) decompose to statistical spinels, whereas precursor (III) decomposes to a normal  $\text{Zn}[\text{Co}_2]\text{O}_4$  spinel. The oxide spinels show a significant catalytic activity in processes of low-temperature oxidation and hydrogenization of hydrocarbons. 24 refs.

**075695 PRECURSORS FOR SOL-GEL PREPARATIONS.** Precursors used for the synthesis of oxide systems by the sol-gel method are reviewed and their role in the various stages of the process is discussed. Emphasis is given to alkoxide precursors and to their physical and chemical properties. In particular, the following topics are discussed: degree of oligomerization, volatility, viscosity, reactions with alcohol, molecular association between alkoxides, hydrolysis, and stabilization against hydrolysis. Some information about preparation methods, commercial products and availability is also given. Among non-alkoxide precursors, nitrates, carboxylates, acetylacetonates, chlorides and other inorganics are described from the point of view of their use in sol-gel preparations. They are compared, when possible, with the corresponding alkoxides. (Author abstract) 89 refs.

## Thermal Conductivity

**075696 DETERMINATION OF THERMAL CONDUCTIVITY AND ESTIMATION OF SPECIFIC HEAT FOR HIGH-TEMPERATURE OXIDES.** A method is proposed for the simultaneous determination of thermal conductivity, thermal diffusivity and specific heat by use of a hot strip. The principle of this method is based on two solutions of the Fourier partial differential equation solved under different time measurement. The slope of this straight line gives thermal conductivity ( $\lambda$ ). On the other hand, the response curve for short time measurement is proportional to the square root of time. The slope of this straight line gives thermal diffusivity ( $k$ ). The specific heat ( $C_p$ ) can be estimated by  $pC_p = \lambda/k$  ( $p$ : density). Using this method, thermal conductivity, gives thermal diffusivity and specific heat of a 30(mol%) $\text{Na}_2\text{O}$ -70( $\text{SiO}_2$ ) sample have been determined over the temperature range 300 to 1500 K in the liquid and glassy states. The thermal diffusivity is nearly constant at low temperatures but decreases with increasing temperature. The specific heat increases with increasing temperature but the absolute values are 1.1-1.2 times higher than those obtained by the laser flash method. (Edited author abstract) 25 refs.

## Thermal Effects

**075697 POLARITY ASYMMETRY OF OXIDES GROWN ON POLYCRYSTALLINE SILICON.** The quality of oxide thermally grown on polycrystalline silicon, commonly referred to as polyoxide, is strongly dependent on polysilicon doping processes and polyoxide growth conditions. The electrical properties of polyoxides using different polysilicon doping processes (in situ, ion implanted, and  $\text{POCl}_3$ ) and different oxidation processes (dry, wet, and LPCVD) have been studied. The emphasis is on the dependence of the polarity asymmetry of leakage current, critical electric field histogram, electron trapping rate, and charge to breakdown. Polyoxides with in situ doped polysilicon exhibit an unusual polarity asymmetry, i.e., higher field enhancement and charge to breakdown are observed when the upper electrode is biased negative. This is the opposite of the asymmetry reported for

polyoxides before. High-temperature annealing of the polysilicon films prior to oxidation reduces this asymmetry. 14 refs.

## Thermodynamic Properties

**075699 APPLICATION OF THE HOCH-ARPSHOFEN MODEL TO THE  $\text{SiO}_2$ - $\text{CaO}$ - $\text{MgO}$ - $\text{Al}_2\text{O}_3$  SYSTEM.** The Hoch-Arpschofen model was applied to the  $\text{SiO}_2$ - $\text{CaO}$ - $\text{MgO}$ - $\text{Al}_2\text{O}_3$  system. First the binary interaction coefficients, obtained from the six binary systems, were used to calculate the Gibbs energy of formation of the ternary compounds present in the four ternary systems; then the calculated activities of  $\text{SiO}_2$ ,  $\text{CaO}$ , and  $\text{Al}_2\text{O}_3$  were compared with the measured activities. The calculated Gibbs energies of formation of anorthite, gehlenite, and cordierite agree with the measured energies; the measured enthalpies of formation of akermanite, diopside, merwinite, and monticellite must be multiplied by formation of akermanite, diopside, merwinite, and monticellite must be multiplied by 0.568 $\pm$ 0.031 to obtain agreement. The Gibbs energy of formation of  $3\text{CaO}$ - $\text{MgO}$ - $2\text{Al}_2\text{O}_3$  was also calculated. The calculated activity data agree with some authors' measurements and not with others. (Author abstract) 15 refs.

**075700 THERMODYNAMIC AND CONDUCTIVITY STUDIES OF NONSTOICHIOMETRIC CERIUM DIOXIDE BY COULOMETRIC TITRATION: A SIMULTANEOUS MEASUREMENT.** The partial molar thermodynamic quantities which consist mainly of variations in oxygen chemical potential with changing temperature and composition, can best be used in support of, and in conjunction with, a proposed defect model. Together they provide insight, understanding, and a concise description of the non-stoichiometric behavior. In previous studies of metal oxides (e.g.,  $\text{CeO}_{2-x}$ ), the electron mobility ( $\mu$ ) has been determined by combining separate experimental measurement of  $x$  and  $\sigma$ . In this study, the electrochemical, constant-composition technique is used as a fast and direct method for obtaining thermodynamic data and simultaneous measurements of the electrical conductivity. (Edited author abstract) 14 refs.

**075701 COMPOSITION CONTROL OF SOME OXIDE FILMS BY MEANS OF A TRI-POLE MAGNETRON SPUTTERING SYSTEM.** This paper describes the newly developed Tri-Pole Magnetron Sputtering System, which has the third magnetic pole of an electric magnet, or the control pole, in addition to the conventional N and S poles between them. The system can switch the polarity of the control pole through the direction of the coil current so that it can shift the target-eroded region by the magnetic field configuration. Therefore, film composition can easily be controlled by an appropriate composite target of coaxial disks corresponding to magnetic field configuration, at the same time changing the duty ratio of the current flowing through the control-pole coil to adjust the sputtering time of each target-component. **075703 EFFECT OF RTA ON THIN THERMAL OXIDE.** The authors look at the effect of a source/drain RTA on the gate oxide quality by measuring the oxide parameters of breakdown voltage, bias-temperature-stress C-V shifts, leakage, and defect density. Use of RTA to activate implants, form silicides, and reflow dielectrics does not degrade 150 Å thermal oxide as long as the temperature is less than or equal to 975°C for 10s. Beyond this temperature, while breakdown and C-V shifts are unaffected and leakage decreases, defect densities become excessive. Since the material adjacent to the oxide during the anneal may be significant in determining the effect of anneal, any application of RTA to processes involving 150 Å gate oxides should be evaluated in terms of effect on gate oxide, most importantly the defect density. 1 ref.

**075704 EFFECT OF ANALYTICAL METHOD OF THICKNESS MEASUREMENTS OF THIN OXIDE FILMS.** The thickness of thin natural oxide films formed on silicon, nickel, aluminum, iron, tantalum and zirconium has been measured using nuclear reaction analysis (NRA) and Auger electron spectroscopy (AES) in combination with ion beam sputtering. It is shown that ion beam effects severely limit the use of AES and ion beam sputtering in measuring thin oxide thicknesses. Relatively

non-destructive techniques such as NRA or angle-resolved x-ray photoelectron spectroscopy (XPS) provide more reliable information. (Author abstract) 27 refs.

**075705 EFFECT OF HYDROGEN PLASMA ON THE PROPERTIES OF INDIUM-TIN OXIDE FILMS.** The effect of hydrogen plasma exposure on the properties of transparent conducting indium-tin oxide films has been studied. The exposure reduces the film surface to elemental indium. The thickness of the reduced layer increases with increasing exposure and finally saturates to a thickness of about 100 nm. The reduced surface is rough and decreases the visible transmittance of these films drastically due to increased absorbance and reflectance. The reduced metal layer decreases the sheet resistance of the films. Annealing of the plasma-exposed film in oxygen recovers the visible transmittance except in the case of the severely damaged films. (Author abstract). 5 Refs.

**075707 MODIFICATION OF OXIDE FILMS BY ION IMPLANTATION:  $\text{TiO}_2$ -FILMS MODIFIED BY X-RAY.** Oxide films can be modified by ion implantation. Changes in the electrochemical properties of the films are due to the deposition profile of the implanted ion, i.e. doping and stoichiometric changes, as well as to the radiation damage. The latter is due to the formation of Frenkel defects and at high concentrations to a complete amorphization of the oxide film.  $\text{TiO}_2$ -films with  $1 < x < 2.5$  were produced by implantation of  $\text{Ti}^{+}$  and  $\text{O}^{+}$ -ions into anodic oxide films on titanium. The electrode capacity shows always the behaviour of an n-type semiconductor with an almost constant flatband potential but a strong maximum donor concentration at about 3 percent  $\text{Ti}^{+}$  concentration. Oxygen implantation, on the other hand, causes a small increase of donor concentration only at high concentration of  $\text{O}^{+}$ . (Edited author abstract). 38 Refs.

Schultze, J.W. (Univ Duesseldorf, Duesseldorf, West Ger); Elfenthal, L.; Leitner, K.; Meyer, O. *Electrochim Acta* v 33 n 7 Jul 1988 p 911-925.

**075708 CHARGE-TRAPPING PROPERTIES OF ULTRATHIN NITRIDED OXIDES PREPARED BY RAPID THERMAL ANNEALING.** Ultrathin (8-nm) oxides were nitrided by lamp-heated rapid thermal annealing in ammonia at 900-1150°C for 5-300 s. Measurements indicate that both the nitrogen concentration near the Si-SiO<sub>2</sub> interface  $[\text{N}]_{\text{int}}$  and the hydrogen concentration in nitrided oxides  $[\text{H}]$  increase monotonically as nitridation proceeds. The flat-band voltage shift  $\Delta V_{\text{FB}}$  and the increase of the midgap interface state density  $\Delta D$  induced by the constant-current stress were investigated. While  $\Delta V_{\text{FB}}$  increases monotonically as nitridation proceeds,  $\Delta D$  is found for the first time to show a turnaround with nitridation time: it increases, reaches a maximum at a certain nitridation time, and then decreases gradually to a value that is lower, in some cases, by more than one order of magnitude than that of a thermal oxide. It is found for the first time that  $\Delta V_{\text{FB}}$  increases in proportion to  $[\text{H}]$ . Based on the turnaround behavior of  $\Delta D$ , a

two-factor model is proposed in which one factor,  $[\text{H}]$ , increases  $\Delta D$  and the other one,  $[\text{N}]_{\text{int}}$ , reduces it. 30 refs.

**075710 OXIDE THICKNESS DETERMINATION IN  $\text{Cr-SiO}_2$ -Si STRUCTURES BY CURRENT-VOLTAGE PAIRS.** A recently proposed method for obtaining the oxide thickness based in current-voltage pairs in the Fowler-Nordheim regime is analyzed in the  $\text{Cr-SiO}_2$ -Si(p) structures with oxide thickness in the range 50-60 Å. After measuring the capacitance-voltage, and current-voltage characteristics, the Fowler-Nordheim plot is obtained, yielding the  $\text{Cr-SiO}_2$  barrier height. Then, applying an iterative technique the oxide thickness is obtained for each I-V pair. The results show that in spite of the oscillatory structure exhibited in the Fowler-Nordheim regime the accuracy in the oxide thickness obtained in this way is much greater than in other electrical methods. ## Transport Properties

**075711 COMMENT ON 'EXPERIMENTAL PROCEDURE FOR DETERMINING TRANSPORT PROPERTIES OF OXIDE SCALES' AND 'DETERMINATION OF TRANSPORT PROPERTIES OF ALUMINA OXIDE SCALE'.** In two previous papers, a procedure and an associated formalism were developed for determining the transport properties ( $i$ ,  $\sigma$ ) of alumina scales formed by oxidation of metallic materials. In agreement with most of the literature data at that time, one of the assumptions was that the predominant moving species consisted of oxygen  $\text{O}^{2-}$  ions. It now appears that  $\text{Al}_2\text{O}_3$  scales can grow either by oxygen- or aluminum-predominant diffusion or by diffusion of both species making it necessary to develop a more general formalism. 3 refs.

**075712 TRANSPORT IN CHEMICAL POTENTIAL GRADIENTS OF MULTICOMPONENT OXIDES.** The ultimate goal of the investigation of solid state reactions in materials science is understanding of the atomistic reaction mechanisms. Therefore, all the complicated conditions at the phase boundaries and the complex phenomenological formalisms in any non-steady state only obscure the atomistic processes. Recent investigations have therefore studied transport in multicomponent nonmetallic solid phases, preferentially in multicomponent oxides, under the action of only the metalloid (oxygen) potential gradient in true steady state in order to clarify the atomistic interpretation. Model investigations of this kind are also of practical importance in view of the fact that nonmetallic, high-temperature ceramics are often multicomponent systems that normally operate under the

action of chemical potential gradients. Oxygen potential gradients are of particular interest. In order to systematize the relevant phenomena described (e.g. crystal shift, demixing, decomposition, external and internal oxidation, morphological instability), the author begins this review with a discussion of binary oxides ( $\text{AO}_n$ ), then progresses to ternary and higher oxides ( $[\text{A}_x\text{B}_y\text{O}_n]$ ). Similar considerations can be applied to sulfides, halides, etc. 47 refs.

Schmalzried, H. (Univ of Hannover, Hannover, West Ger). *Annu Rev Mater Sci* v 17 1987 p 149-160.

## Vacuum Applications

**075713 SOLID STATE OXYGEN SOURCE FOR UHV.** The principle of a solid state oxygen source is based on heating thermally decomposable metal oxides. In this procedure extremely pure oxygen is generated by variation of the heating temperature. The small size of the solid state oxygen source permits different applications and makes it easy to install in UHV systems. In this paper the features of this newly developed oxygen source and its application to thermal field emission are reviewed. (Author abstract) 5 refs.

Speidel, R. (Univ Tuebingen, Tuebingen, West Ger); Weidlich, E-R. *Vacuum* v 38 n 2 1988 p 89-92.

## Vaporization

**075714 MASS SPECTROMETRIC STUDY OF VAPORIZATION IN THE  $\text{SrO-B}_2\text{O}_3$  O<sub>3</sub> SYSTEM.** Vaporization in the  $\text{SrO-B}_2\text{O}_3$  system has been studied by a mass spectrometric Knudsen effusion method in the temperature range of 1281-1572 K. The vapor species  $\text{Sr(g)}$ ,  $\text{SrBO}_2(\text{g})$ ,  $\text{BO(g)}$ ,  $\text{B}_2\text{O}_2(\text{g})$ , and  $\text{B}_2\text{O}_3(\text{g})$  have been identified. On the basis of the partial pressures, the enthalpy of formation and the dissociation energy for  $\text{SrBO}_2(\text{g})$  have been determined and are compared with the values obtained for other alkaline earth metaborates and oxides and further alkali metaborates and monoxides. (Edited author abstract). 39 Refs.

Kou, Tomoyuki (Kyoto Univ, Uji, Jpn); Asano, Mitsuru. *High Temp Sci* v 24 n 1 Aug 1987 p 1-19.

## Wetting

**075715 WETTABILITY OF SOLID OXIDES BY LIQUID PURE METALS.** In this work, the wettabilities of solid oxides ( $\text{Al}_2\text{O}_3$ ,  $\text{MgO}$ ,  $\text{CaO}$ ,  $\text{ZrO}_2$  and  $\text{SiO}_2$ ) by liquid pure metals (Sn, Ag, Au and Cu) have been measured over a wide temperature range by the sessile drop method. Surface tension can be expressed by equations. Contact angles and work of adhesion between liquid pure metals and solid oxides are closely related to the standard free energy change of formation of oxides. Values of contact angle and work of adhesion change linearly with temperature. The wettability depends not only on the stability of solid oxides which can be expressed by the standard free energy change of oxide formation but also on the ionic radii of metals which compose the oxides. (Edited author abstract) In Japanese. 44 refs.

**075716 ANOMALOUS LUMINESCENCE OF SINGLET OXYGEN  $O_2(^1\Delta)$  IN MEDIUM WITH A CONDENSED DISPERSE PHASE.** The physical and chemical properties of long-lived electron-excited molecules are extensively studied. The present work theoretically predicts a new physical phenomenon, namely an increase in luminescence intensity (LI) of the singlet oxygen in DM as compared to that in a gas. 11 refs.

Kochelap, V.A. (Acad of Sciences of the Ukr SSR, Kiev, USSR); Izmailov, I.A.; Datzuk, V.V. *Opt Commun* v 66 n 4 May 1 1988 p 195-197.

**075717 INVESTIGATION OF THE PERMEABILITY OF OXYGEN THROUGH SILVER DURING A COMBINED DISCHARGE.** Results of experimental investigations of the permeability of oxygen through a silver polycrystal under the conditions of a high frequency discharge are described. The effect of a substantial increase in the permeability of oxygen within the temperature range of 473-873 K depending on the parameters of the electrodeless discharge is established. An increase in the permeability of oxygen through silver under the combined discharge, i.e., under the simultaneous effect of glow- and high frequency discharges is found. A theoretical justification of the gas permeability processes is presented. (Translated author abstract) In Russian. 8 refs.

Makhamov, T.M.; Radzhabov, T.D.; Suyarov, N.Yu. *Izv Sib Otd Akad Nauk SSSR Ser Tekh Nauk* n 18 1987 p 69-71.

**075718 ADDITIONS OF SINGLET OXYGEN TO ALKOXY-SUBSTITUTED DIENES. THE MECHANISM OF THE SINGLET OXYGEN 1,2-CYCLOADDITION REACTION.** The reactions of singlet oxygen with (E,E)-, (E,Z)-, and (Z,Z)-1,4-dimethoxy-1,3-butadienes are reported. These compounds react to give dioxetanes as the major oxidized products. All three compounds are suggested to react via zwitterions, which collapse to dioxetanes before rotational equilibrium is reached. The zwitterions are stabilized in the more polar solvents, and as a result their rotation competes more effectively than in less polar solvents with closure to the dioxetanes. (Author abstract) 40 refs.

**075719 OXYGEN TRANSFER INTO NEWTONIAN AND NON-NEWTONIAN FLUIDS IN MECHANICALLY AGITATED VESSELS.** Oxygen transfer into Newtonian and non-Newtonian fluids was studied in stirred tank vessels. Emphasis was given to the rheological effects of the pseudoplastic medium on the volumetric oxygen transfer coefficient,  $K_L a$ . Results indicate that  $K_L a$  is a strong function of gassed power input per unit volume ( $P_g/V$ ) for the Newtonian fluid, but a weak function of  $P_g/V$  for the non-Newtonian fluid, and a strong function of superficial gas velocity ( $V_g$ ) for both fluids for paddle-type impellers.  $K_L a$  is found to decrease rapidly with an increase in apparent viscosity for values of

$\mu_a$  greater than 2.0 Pa · s. In addition to various correlations, a dimensionless correlation including the impeller Reynolds number, impeller Weber number, and the aeration number is presented for the prediction of  $K_L a$  in a gas-liquid non-Newtonian system. (Author abstract) 17 refs.

Ogut, Ali (Univ of Maryland, College Park, MD, USA); Hatch, Randolph T. *Can J Chem Eng* v 66 n 1 Feb 1988 p 79-85.

**075720 KINETICS OF ABSORPTION OF OXYGEN IN AQUEOUS ALKALINE SOLUTIONS OF POLYHYDROXYBENZENES.** Kinetics of oxygen absorption in aqueous alkaline solutions of polyhydroxybenzenes (PHBs) such as pyrogallol (PG), p-tert-butylcatechol (PTBC), tert-butylhydroquinone (TBHQ), 2,3,5-trimethylhydroquinone (TMHQ), and gallic acid (GA) was studied in a jet apparatus, a stirred cell, and a model stirred reactor, at  $29 \pm 1^\circ\text{C}$ . In the cases of PTBC and TBHQ, the reaction was found to be first order in oxygen as well as PTBC or TBHQ. The intrinsic second-order rate constants were in the range of  $1 \times 10^3$ – $1 \times 10^5 \text{ m}^3/(\text{kmol} \cdot \text{s})$ . In the case of PG, GA, and TMHQ, the system conformed to the instantaneous reaction regime. The theory of gas absorption with an instantaneous reaction was used to calculate the diffusivity of dissolved PG and GA. (Edited author abstract) 22 refs.

Patwardhan, Anand V. (Univ of Bombay, Bombay, India); Sharma, Man Mohan. *Ind Eng Chem Res* v 27 n 1 Jan 1988 p 36-41.

**075721 ACTIVATION OF MOLECULAR OXYGEN BY COPPER SALTS IN ACETIC ACID AND APPLICATION TO OXIDATION OF 1,4-DIPHENYLBUTADIENE AND OF 2,6-DI-T-BUTYLPHENOL: A 2,4-DIPHENYLFURAN SYNTHESIS.** The stoichiometry and the kinetics of molecular oxygen absorption by the  $\text{Cu}(\text{OAc})_2\text{-LiBr}$  system in solution in acetic acid-acetic anhydride (1:1) mixture has been investigated in the presence respectively of 1,4-diphenyl-1,3-butadiene (3) and of phenols as substrates. The former affords 2,5-diphenylfuran (5), whereas 2,6-di-t-butylphenol (10) leads to the formation of quinoid derivatives (12). The results are discussed on the basis of a duality of mechanism: the copper-LiBr catalyst used acts both as a dioxygen activation catalyst and as a halogenation system, this last aspect receiving further support from the copper halide-catalyzed oxidation of indene. (Author abstract) 20 refs.

**075722 MASS TRANSFER COEFFICIENT FOR OXYGEN ABSORPTION INTO A SOLID PARTICLE SUSPENSION IN A STIRRED TANK ABSORBER.** The influence of suspended solid particles on the volumetric mass transfer coefficient in the liquid phase ( $k_L a$ ) has been examined experimentally with the absorption of oxygen into slurries of various concentrations and sizes of glass beads and limestone particles by using a stirred tank reactor. The value of  $k_L a$  first decreases with an increase in the solid concentration, and then locally increases in a certain range of the solid concentration. It is considered that the decrease in  $k_L a$  is due to a decrease in the value of A and that the increase is mainly due to an increase in the value of  $k_L$ . The effect of temperature is considered to be caused mainly by the difference in the diffusivities of oxygen at different temperatures employed in this study. (Edited author abstract) 13 refs.

**075723 PREDICTION OF  $K_L a$  IN CONVENTIONAL STIRRED FERMENTERS.** In this work values of the volumetric oxygen transfer coefficients ( $k_L a$ ) were determined (by means of the sulphite oxidation technique) in a series of 8- to 1000-dm<sup>3</sup> stirred fermenters

over a wide range of superficial air velocities and impeller rotational speeds. In spite of the great scale-up ratios, very different operating conditions and geometric dissimilarity, it was possible to develop an acceptable correlation of data (the average error being 17.5 percent) utilizing the gassed power consumption and aeration rate per unit volume as key parameters. Since such a correlation succeeded in reconstructing mass transfer rates even in 2.25-m<sup>3</sup> stirred fermenters, it would seem possible to rely on it to allow approximate, but acceptable prediction of  $k_L a$  values in large size multiple-impeller fermenters even when geometric similarity in scaling-up is not maintained. (Author abstract) 30 refs.

**075724 EVIDENCE FOR TWO OXYGEN CHEMISORPTION SITES ON THE Cr (100) SURFACE AT ROOM TEMPERATURE.** The interaction of oxygen with the clean Cr (100) surface has been investigated by work function measurements angle resolved photoemission spectroscopy and low energy electron diffraction. At low coverages (approx. 0.15 monolayer (ML)) the adsorbed oxygen is characterized by a work function decrease, a feature at 6.8 eV binding energy in UPS and a weak diffuse  $C(2 \times 2)$  diffraction pattern. This form of oxygen labeled form a is quite stable at temperatures below 500°C. Upon further exposure at room temperature ( $> 0.20 \text{ ML}$ ) a second form of oxygen labeled form b and characterized by a work function increase and peaks at 3.8 and 5.9 eV at normal photo-emission is identified. It is proposed that oxygen in forms a and b is chemisorbed in the fourfold hollow and on-top sites respectively. (Author abstract) 22 refs.

**075725  $O_2$  AND  $N_2$  GAS PERMESELECTIVITY OF ALTERNATING COPOLY(VINYLIDENE CYANIDE-VINYL ACETATE).** The sorption and permeation of oxygen and nitrogen in and through alternating copoly(vinylidene cyanide-vinyl acetate) membranes annealed for different periods just below  $T_g$ , 160°C, were investigated over the pressure range from 100 to 1000 cmHg. The dual-mode sorption and mobility models were used to analyze the results. A sub- $T_g$  annealing of copoly(VDCN-VAc) caused a slight decrease in the amount of sorption in the membranes. This decrease in the amount of oxygen and nitrogen sorption can be attributed to a decrease in the Langmuir sorption capacity term,  $C_H$ , with increasing sub- $T_g$  annealing period. The densification of copoly(VDCN-VAc) membranes caused simultaneously by the annealing remarkably reduced diffusion coefficients for both gases. (Edited author abstract) 10 refs.

**075726 TPD AND XPS STUDIES OF  $O_2$ ,  $CO_2$ , AND  $H_2O$  ADSORPTION ON CLEAN POLYCRYSTALLINE GRAPHITE.** Temperature programmed desorption (TPD) and X-ray photoelectron spectroscopy (XPS) studies on clean polycrystalline graphite under ultra-high vacuum conditions are described. The same three strongly bound oxygenated species are formed after  $O_2$ ,  $CO_2$ , and  $H_2O$  adsorption. They decompose to give CO at 973, 1093, and 1253 K. Small amounts of  $CO_2$  are also produced after adsorption of these gases, with desorption

temperatures at 463, 573, 693, and 793 K. Attempts are made to ascribe these TPD features more precisely. After  $H_2O$  adsorption, some  $H_2$  is evolved at ca. 1300 K. Hydrocarbons ( $C_1$ - $C_6$ ) are also produced but in smaller amounts. A general mechanism is proposed for the gasification reactions of graphite with  $O_2$ ,  $CO_2$ , and  $H_2O$ . (Edited author abstract). 33 Refs.

**075727 KINETICS OF ABSORPTION OF OXYGEN INTO AQUEOUS SODIUM SULFITE: ORDER IN OXYGEN.** The kinetics of oxidation of sodium sulfite, which is catalyzed by cobalt ions, has received considerable attention in the chemical engineering literature. Ahmad et al. report that order in oxygen is first order for the oxygen partial pressure range of 0.2 to 1 atm for ammonium sulfite oxidation. Botton et al. also concluded first-order dependency for the same pressure range. When the experimental results are extrapolated to zero oxygen concentration, they do not yield zero absorption rate, indicating that the order in oxygen is higher than one at low oxygen concentrations. This investigation provides accurate substantial data. 12 Refs.

**075728 ATOMIC SCALE CHARACTERIZATION OF OXYGEN ADSORBATES ON Al(111) BY SCANNING TUNNELING MICROSCOPY.** We present atomic scale STM pictures of clean and oxygen containing Al(111) surfaces. Little influence of the surface oxygen on the topography of the surfaces is found. Three different oxygen species can be distinguished. One of them is associated with adsorbed oxygen and found to grow in small islands upon adsorption at 300 K. Characteristic hexagonal nuclei, created upon annealing of a dilute oxygen adlayer, represent the second one. By comparison with existing spectroscopic data these are assigned to nuclei of a surface oxide. (Author abstract). 9 Refs.

**075729 HIGH TEMPERATURE RATE COEFFICIENT FOR THE REACTION OF  $O(^3P)$  WITH  $H_2$  OBTAINED BY THE RESONANCE ABSORPTION OF O AND H ATOMS.** The reaction of  $O(^3P)$  with  $H_2$  has been studied behind reflected shock waves in the temperature range of 1713-3532K at total pressures of about 1.4-2.0 bar by Atomic Resonance Absorption Spectroscopy using mixtures of  $N_2O$  and  $H_2$  highly diluted in Ar. The O atoms were generated by the fast thermal decomposition of  $N_2O$  and the reaction with  $H_2$  was followed by monitoring the time dependent O and H atom concentrations in the postshock reaction zone. For the experimental conditions chosen, the measured O and H atom concentrations were primarily sensitive to the well-known  $N_2O$  dissociation and to the studied reaction and hence its rate coefficient could be deduced. (Edited author abstract) 24 refs.

## Compressors

**075730 HIGH PRESSURE OXYGEN CENTRIFUGAL COMPRESSOR FOR UBE INDUSTRIES, LTD.** IHI-SULZER developed a high-pressure oxygen centrifugal compressor indispensable for coal gasification plants

with paramount emphasis on safety through vigorous theoretical and experimental studies to cope with the various problems involved in compressor engineering. In July 1984, IHI delivered to Ube Industries, Ltd., of Ube, Yamaguchi Prefecture, the world's largest oxygen compressor rated as a discharge pressure of 60 kgf/cm<sup>2</sup> (5.9 MPa) and a flow rate of 40,000 m<sup>3</sup> (normal)/h driven by a 9,150 kW steam turbine for the world's first ammonia plant using gasified coal. The features, specifications and construction of this oxygen compressor are described in this article.

**075732 OXYGEN DIFFUSIVITY IN ELLIS LIQUIDS.** The objective of present study was to determine the oxygen diffusivity in polyacrylamide solutions whose rheological behavior was described by the Ellis flow model. It is found that in polymer solutions values of oxygen diffusivity greater than those in water at the same temperature have been established. However, the diffusivity of oxygen in polymer solutions was of the same order of magnitude as that in water. For more synoptical comparison the ratio of the oxygen diffusivity in polyacrylamide solutions to that in water at the same temperature,  $D/D_w$ , is also reported. 7 refs.

**075735 ANOMALY OF OXYGEN DIFFUSION IN AQUEOUS XANTHAN SOLUTIONS.** A membrane-covered polarographic oxygen electrode was used to measure oxygen diffusion coefficients in aqueous polyelectrolyte solutions of xanthan gum, sodium alginate, and sodium carboxymethylcellulose (CMC). In sodium alginate solutions, dilute xanthan solutions, and solutions containing more than 0.3 wt% CMC, oxygen diffusion coefficients decrease with increasing polymer concentrations. Interestingly, in dilute CMC solutions and concentrate xanthan solutions containing more than 0.5 wt% xanthan gum, oxygen diffusion coefficients increase with increasing polymer concentrations, and values exceeding that in pure water are generally observed. (Author abstract) 49 refs.

**075736 SIMULTANEOUS MEASUREMENTS OF OXYGEN DIFFUSION COEFFICIENTS AND SOLUBILITIES IN FERMENTATION MEDIA WITH POLAROGRAPHIC OXYGEN ELECTRODES.** A membrane-covered oxygen electrode was used to measure oxygen diffusion coefficients and solubilities in aqueous glucose solutions and various fermentation media following a newly developed methodology. The fermentation media studied were tryptic soy broth and those for fermentations of *Penicillium chrysogenum*, *Saccharomyces cerevisiae* and *Micrococcus glutamicus*. The experimental results of oxygen diffusion coefficients and solubilities in glucose solutions were in good accord with the literature data. As for the fermentation media, both oxygen diffusion coefficients and solubilities were found to decrease with an increased fractional composition of these media, and log-additive behaviors of the oxygen diffusion coefficients and solubilities in fermentation media were observed. (Author abstract) 47 refs.

Ju, Lu-Kwang (State Univ of New York, at Buffalo, Buffalo, NY, USA); Ho, Chester S.; Baddour, Raymond F. *Biotechnol Bioeng* v 31 n 9 Jun 5 1988 p 995-1005.

**075737 COMMENTS ON VALIDITY OF MEASURING OXYGEN DIFFUSION COEFFICIENTS WITH POLAROGRAPHIC OXYGEN ELECTRODES.** A basic feature of the arrangements already developed for measuring oxygen diffusion coefficients with polarographic oxygen sensors by T.K. Goldstick and I. Fatt and K. Akita is that a liquid film of small volume is situated in precisely defined geometric shapes between the membrane and the surrounding atmosphere. As a result, the effect of side oxygen diffusion can correctly be eliminated by calibration, since its effect in the actual measurement is the same as in the calibration measurements. Owing to this, the oxygen side diffusion may exert different effects in their measurements, depending on the uncontrolled variable, which is the absolute distance between the membrane and the gas-liquid interface. 10 refs.

Linek, V. (Prague Inst of Chemical Technology, Prague, Czech); Vacek, V. *Biotechnol Bioeng* v 31 n 9 Jun 5 1988 p 1010-1011.

**075738 EFFECTS OF MICROORGANISMS ON EFFECTIVE OXYGEN DIFFUSION COEFFICIENTS AND SOLUBILITIES IN FERMENTATION MEDIA.** Effective oxygen diffusion coefficients and solubilities were measured for submerged cultures of *Saccharomyces cerevisiae*, *Escherichia coli*, and *Penicillium chrysogenum*. Both effective oxygen diffusion coefficients and solubilities were found to decrease with increasing cell concentrations in the fermentation media. Comparison of the experimental results of effective oxygen diffusion coefficients in fermentation media with values theoretically predicted on the assumption of unpenetrable microbial cells indicates that oxygen molecules diffuse through the cells during the diffusion process. Within the cell concentration range of typical submerged fermentations, the effective oxygen diffusion coefficient of the fermentation media can be described as  $D_e/D_1 = 1 + A_1f + A_2f^2$ . In this equation,  $f$  is the cell volume fraction and both  $A_1$  and  $A_2$  are functions of the shape of the shape of the cells and the ratio of effective oxygen diffusion coefficient in microbial cells to that in the medium. (Author abstract). 59 Refs.

**075739 FLEXIBLE APPROACH TO AMPEROMETRIC OXYGEN DETERMINATION.** In vitro and in vivo results obtained from a novel flexible amperometric oxygen sensor are reported. The sensor is fabricated using thin film deposition techniques and is operated by the application of a pulsed waveform. Development of the sensor was undertaken in order to produce a device that is capable of being sited at the interface of a wound and an overlying wound dressing. Oxygen determinations in such an environment would aid in gaining an understanding of the role of oxygen in wound healing and the type of wound dressing that would provide an environment conducive towards wound healing. In vitro data indicate that linearity of response is good although other performance characteristics are irreproducible. In vivo response to oxygen has been observed 50 h after insertion into a porcine sham wound. Expected trends were followed when changes to the oxygen regime of the wound space were effected, but absolute values of oxygen tension are difficult to state with certainty. This may be due to poor calibration stability and inadequate sealing of the sensor from the surrounding environment. (Author abstract) 10 refs.

## Encapsulation

**075740 ENCAPSULATION OF OXYGEN AND NITROGEN BY ZEOLITES FOR THEIR STORAGE.** The authors conducted experimental studies of nitrogen and oxygen encapsulation by the synthetic zeolite KNaA containing 68% K<sup>+</sup> and 32% Na<sup>+</sup> in the pressure range 10-100 MPa and temperature range 450-600°K, as well as of nitrogen encapsulation by the commercial zeolite KNaA which contains approx. 20 wt.% clay as binder. The experimental results for nitrogen and oxygen encapsulation by zeolites are given. The results of the studies of nitrogen and oxygen encapsulation by the zeolite KNaA with various degrees of ion exchange are presented. It is shown that the volume of the gas encapsulated by the zeolite depends not merely on the temperature and pressure of the gas in encapsulation process. 5 refs.

## Ionic Conduction

**075741 OXYGEN ION CONDUCTIVITY OF THE CERIA-SAMARIUM OXIDE SYSTEM WITH FLUORITE STRUCTURE.** Ionic conduction of oxygen in the ceria-samarium oxide system was investigated as a function of temperature, partial pressure of oxygen and the oxide composition, together with its crystal structure, density and defect structure. The ionic conductivity of  $(\text{CeO}_2)_{1-x}(\text{SmO}_{1.5})_x$  was the highest in  $\text{ZrO}_2$ ,  $\text{ThO}_2$  and  $\text{CeO}_2$ -based oxide systems. The system  $\text{CeO}_2\text{-SmO}_{1.5}$  consisted of the solid solution with a fluorite structure at  $x < 50$  at. percent. The ionic transference number was nearly unity between 600 and 900°C. With an increase in  $\text{Sm}_2\text{O}_3$  content, the ionic conductivity gradually decreased due to a decrease in mobility of oxygen ions. The samarium oxide-doped ceria was less reducible than pure and alkaline earth oxide-doped ceria. (Author abstract). 17 Refs.

## Magnetic Properties

**075743 MAGNETIC STRUCTURE OF  $\beta$  OXYGEN: A NEUTRON POLARIZATION ANALYSIS STUDY.** We have performed a differential polarization analysis neutron scattering experiment on  $\beta$  oxygen to measure the magnetic part of the scattering and determine its magnetic structure. We have checked all the models proposed for  $\beta$  oxygen and all those compatible with crystal symmetry. The model which fits the experimental neutron profile best is a two dimensional short range order, a helix propagating perpendicularly to the three fold axis with an angle close to 140° between neighboring molecules and with a correlation length of 5 Å. (Author abstract) 18 refs.

Dunstetter, F. (CEN-Saclay, Gif-sur-Yvette, Fr); Plakhti, V.P.; Schweizer, J. *J Magn Magn Mater* v 72 n 3 Apr 11 1988 p 258-266.

**Manufacture** See Also COMPRESSORS—Design.

**075744 PROCESS DESIGN AND EVALUATION OF A CONTINUOUS CHEMICAL PLANT FOR THE SINGLET OXYGEN-IODINE LASER.** Process designs were evaluated for the continuous, large-scale generation of a singlet delta oxygen for use in a chemical oxy-

gen-iodine laser. The excited singlet oxygen is generated from the chemical reaction of chlorine gas with basic hydrogen peroxide. The chemical reaction also produces a large waste brine stream that can be controlled by recycling through a chlor-alkali cell, which regenerates the reactants  $\text{Cl}_2$  and  $\text{NaOH}$ . To prevent deactivation of this excited oxygen, a large excess of hydrogen peroxide is typically used to change the reaction mechanism. This use of excess hydrogen peroxide or nonstoichiometric generation leads to substantial increases in capital and operating costs when compared with theoretical stoichiometric (no excess) generation. (Edited author abstract) 13 refs.

**Mass Transfer** See Also PULP MANUFACTURE—Bleaching; VITAMINS—Fermentation.

**075745 GAS HOLDUP AND VOLUMETRIC OXYGEN TRANSFER COEFFICIENT IN A THREE-PHASE FLUIDIZED BED BIOREACTOR.** The gas-liquid volumetric oxygen transfer coefficient in a three-phase fluidized bed bioreactor was studied using Ca-alginate gels as the solid phase. The coefficient,  $k_{L,a}$ , in three-phase fluidized beds was smaller than that in bubble columns, regardless of gel diameter. This result was a new finding, and was shown to be characteristic of low-density gel beds. The value of  $k_{L,a}$  decreased with decreasing gel diameter and with increasing particle concentration in the liquid suspension. This indicates that an optimal gel diameter and particle concentration exist in application of gels to the bioreactor. Dimensionless correlations are proposed for  $k_{L,a}$  and  $C_G$ . (Author abstract) 14 refs.

Sun, Yan (Univ of Tokyo, Tokyo, Jpn); Nozawa, Taihei; Furusaki, Shintaro. *J Chem Eng Jpn* v 21 n 1 Feb 1988 p 15-20.

**075746 MEAN BUBBLE DIAMETER AND OXYGEN TRANSFER COEFFICIENT IN A THREE-PHASE FLUIDIZED BED BIOREACTOR.** The volume-surface mean diameter of bubbles  $d_{v,s}$  was measured using the electroresistivity probe method. From the mean bubble diameter and volumetric mass transfer coefficient  $k_{L,a}$ , interfacial area  $a$  and mass transfer coefficient  $k_L$  were obtained. The solid phase, Ca-alginate gels, had almost no effect on bubble breakup, and a decrease in  $k_{L,a}$  with decreasing gel diameter was found to be caused by the corresponding decrease in  $k_L$ . The mean bubble diameter increased significantly with increasing particle concentration. The value of  $k_L$  was not affected by particle concentration. Thus, a decrease in  $k_{L,a}$  with increasing particle concentration was mainly attributed to the corresponding decrease in interfacial area. Dimensionless correlations were proposed for  $d_{v,s}$ ,  $a$  and  $k_L$ . (Author abstract) 7 refs.

Sun, Yan (Univ of Tokyo, Tokyo, Jpn); Furusaki, Shintaro. *J Chem Eng Jpn* v 21 n 1 Feb 1988 p 20-24.

**075747 MASS TRANSFER OF OXYGEN IN POLY(2-HYDROXYETHYL METHACRYLATE).** The diffusion coefficient of oxygen in poly(2-hydroxyethyl methacrylate) has been explicitly measured using an optical technique based on fluorescence quenching. This measurement represents the first explicit determination of  $D_{O_2}$  in PHEMA. A diffusion coefficient of oxygen in PHEMA of  $1.36 \times 10^{-7} \text{ cm}^2/\text{s}$  at 20°C was obtained from this measurement. This value is shown to agree well with permeability data for PHEMA, the free volume theory of diffusion, and with values of  $D_{O_2}$  that have been explicitly measured in other methacrylate hydrogels. (Author abstract) 17 refs.

**075748 CONTACT-FREE MEASUREMENTS OF OXYGEN CONCENTRATION IN INDUSTRIAL FLAMES BY RAMAN SCATTERING.** Spatially resolved oxygen concentration measurements were performed in premixed hydrocarbon flames by using laser induced spontaneous Raman scattering. The measurements demonstrate the performance of a relatively simple pulsed laser Raman probe for fundamental combustion studies and also for the control of the equivalence ratio in flames (best spatial resolution: 0.2 mm<sup>3</sup>; theoretical detection limit: 0.8% of O<sub>2</sub>). Comparison of the results with those obtained by a mechanical suction probe (Magnos 2 T) confirmed a good agreement. At present, control of different stoichiometric conditions is possible at a minimum O<sub>2</sub> concentration of 1.3%. (Author abstract) 29 refs.

Leipertz, Alfred (Ruhr-Univ Bochum, Bochum, West Ger); Haumann, Juergen; Fiebig, Martin. *Chem Eng Technol* v 10 n 3 Jun 1987 p 190-203.

**075749 IMPROVED METHOD FOR DETERMINATION OF THE VOLUMETRIC OXYGEN TRANSFER COEFFICIENT IN FERMENTATION PROCESSES.** The volumetric oxygen transfer coefficient,  $K_L a$ , is one of the most important parameters in the scale-up of aerobic fermentation processes. It is a measure of the gas-liquid-oxygen transfer performance of a given fermentor. Because of the involvement of oxygen in the metabolic energy supply, the  $K_L a$  value may play a key role in the synthesis of products and biomass. This report intends to present a quick, convenient, and reliable method for determination of  $K_L a$  values in fermentation processes without difficulties encountered in the previous methods. In the previous communication, some preliminary considerations were discussed. Both theoretical considerations and experimental results in detail has been provided here. 8 refs.

## Microanalysis

**075750 SOLID STATE EFFECTS ON CORE ELECTRON CROSS-SECTIONS USED IN MICROANALYSIS.** In quantitative electron energy loss spectroscopy, there has been some controversy as to whether fine structure due to solid state effects leads to errors in quantitative analysis. We consider the oxygen K edges in MnO and MnO<sub>2</sub>, which are different environments for the oxygen fine structure. We show that the partial cross-sections as a function of energy window for the oxygen K edge oscillate about the isolated atom partial cross-section. For an energy window larger than 20 eV, the worst-case error is of the order of 5%. (Author abstract) 11 refs.

## Monitoring

**075751 OXYGEN MONITORING IN ENVIRONMENTAL CHAMBERS PAYS SAFETY DIVIDENDS.** At Hughes Aircraft Co., continuous oxygen monitoring systems are providing an extra level of worker protection in facilities where advanced electronic components for radar, defense and communications systems are tested. A comprehensive monitoring system is used in confined space applications due to the safety needs in and around the environmental chambers used for testing electronic components used in satellites and other aerospace applications.

## Partial Pressure Sensors

**075752 SIMPLE ZERO CALIBRATOR FOR TRANSCUTANEOUS OXYGEN ELECTRODES.** The authors have developed a simple 'zero calibrator' which requires no gas bottles or chemical solutions. The calibrator essentially consists of an uncovered polarographic oxygen electrode having a large cathode 1 cm in diameter. This is mounted in a plastic chamber into which the transcutaneous oxygen electrode can be fitted. In the chamber, the thin gap between the oxygen electrode cathode and the face of the transcutaneous sensor is filled with water containing a small amount of salt (NaCl). When the calibrator is switched on, the large cathode rapidly consumes the oxygen present in the thin layer of water trapped between it and the transcutaneous sensor membrane. As a result, the oxygen reading from the transcutaneous sensor drops exponentially to zero. Oxygen replenishment from the atmosphere is prevented by the liquid seal between the transcutaneous sensor membrane ring and the circumference of the calibration chamber. 2 refs.

## Permeability, Mechanical

**075753 EFFECTS OF NONVOLATILE ADDITIVES ON PERMEABILITIES OF O<sub>2</sub> AND N<sub>2</sub> THROUGH WATER-SWOLLEN POLY(VINYL ALCOHOL) MEMBRANES.** Effects of various nonvolatile additives on the permeabilities of O<sub>2</sub> and N<sub>2</sub> through water-swollen poly(vinyl alcohol) membranes were investigated. It was found that the addition of substances with a high affinity for the polymer chain altered significantly the permselectivity to O<sub>2</sub> over N<sub>2</sub>. For such solution/membrane systems, the permeability ratio of O<sub>2</sub> to N<sub>2</sub> ranged from 4 to 14, higher than that of any previously reported polymer membrane. To examine the mechanism of permeation of the gases, a dual path model is presented to account for the variation of diffusivity with swelling ratio. The enhanced permselectivity to O<sub>2</sub> over N<sub>2</sub> is attributed to the presence of a polymer-perturbed solution in the membrane rather than the bulk solution. (Author abstract) 13 refs.

**Precipitation** See SEMICONDUCTING SILICON—Growth; SEMICONDUCTING SILICON—Impurities.

**Production** See Also ANODES—Dissolution; ELECTRODES—Materials; METALS AND ALLOYS—Amorphous; STEELMAKING—Waste Heat Utilization.

**075754 INDUSTRIAL OXYGEN PRODUCTION—PRESENT STATE AND FUTURE PROSPECTS.** The paper describes principal methods of separating oxygen from air. Discussion focuses on (1) Cryogenic process, (2) Pressure swing adsorption (PSA) process and (3) Membrane process. Other developing technologies such as the chemical absorption process using molten alkali salts and the liquid membrane process are also briefly discussed. The cryogenic process is the best way to produce high purity oxygen at a rate of over 5,000 m<sup>3</sup>/h while the PSA process is suitable for producing oxygen of relatively high purity up to 5,000 m<sup>3</sup>/h at the moment. The use of gaseous oxygen supplies by PSA plants is expanding while the liquid oxygen market is shrinking. Polymeric membranes are used for medical purposes and also oxygen-enriched air production for efficient combustion. The method using molten salts absorption and the liquid membrane method are still under development but are expected to significantly reduce power consumption for high purity oxygen separation in the near future. **075755 OXYGEN EVOLUTION AT PASSIVATED METAL SURFACES.** The problem of oxygen evolution at the surface of an anodically dissolving, passivated metal is discussed. This process is shown to be a concomitant process that can occur, both at potentials more negative and at potentials more positive than the transpassivation potential  $E_p$ . Transpassivation occurs since at  $E \approx E_p$  the point defect concentration of the passivating oxide attains its highest admissible value. (Author abstract) 2 refs.

**075756 ELECTROCATALYSIS BY AMORPHOUS NiCoZr ALLOYS OF OXYGEN EVOLUTION IN 30 W/O KOH AT 70°C.** In this present communication, amorphous alloys NiZr<sub>2</sub>, (Ni<sub>0.4</sub>Co<sub>0.6</sub>Zr<sub>2</sub>), (Ni<sub>0.4</sub>Co<sub>0.6</sub>Zr) and pure Ni and Co are investigated as anodes for O.E.R. (Oxygen Evolution Reaction) from 30 w/o KOH at 70°C. The authors conclude that the addition of cobalt is beneficial for O.E.R. The difference between Co and (Ni<sub>0.4</sub>Co<sub>0.6</sub>Zr) amorphous alloy as far as the electrocatalytic activity is concerned is due mainly to the lower Tafel slope observed for the Co anode. For all materials investigated, holding the potential at +0.7 V<sub>Hg/HgO</sub> for 1 h before scanning results in higher  $\eta_{250}$  values. 6 refs.

**075757 OXYGEN EVOLUTION REACTION ON THICK HYDROUS NICKEL OXIDE ELECTRODES.** The electrocatalytic characteristics of thick hydrous oxide films obtained by repetitive square-wave potential perturbations for the oxygen evolution reaction in alkaline solutions are studied. Two kinds of films, fresh and aged, which can be related to the  $\alpha$  and  $\beta$  nickel oxide structures respectively were used. The results show a marked difference between their Tafel slopes. Besides, a linear dependence of the apparent electrocatalytic activity upon the amount of oxide present in the film is obtained, which is explained on the basis of an increase in the roughness factor. (Author abstract) 32 refs.

## Recovery

**075758 RECOVERY OF USED OXYGEN IN THE COURSE OF OXYGEN-SODA COOKING OF CELLULOSE PULP.** It is shown that in pure oxygen at 350° and a space velocity of 10,000 m<sup>3</sup>·h<sup>-1</sup>/m<sup>3</sup> the degree of oxidation of the organic substances is 76%. The degree of oxidation increases if the oxygen is diluted with an inert compound to concentrations characteristic of waste gases from the digester. On the basis of the results of model tests the following principal technological parameters for catalytic purification of oxygen-containing gas from production of cellulose pulp by the oxygen-soda process may be recommended with adequate reliability: temperature 350°, space velocity 30,000 m<sup>3</sup>·h<sup>-1</sup>/m<sup>3</sup>, content of inert components not less than 8%. If the content of inert components in the original gaseous mixture is less than 8% the process temperature must be raised to 400-450°. The results of investigations of purification by the potash method are given. It is evident from the experimental results that at a constant overall process pressure, which depends on the conditions of pulp cooking (2.0 MPa), accumulation of CO<sub>2</sub> in the gas to be treated improves the operating conditions of the potash treatment stage. 5 refs.

**075759 MECHANISM OF CATHODIC OXYGEN REDUCTION IN A CARBON SUPPORT-LACCASE ENZYME SYSTEM.** The effects of solution pH, oxygen pressure, laccase inhibitors, and temperature on the electroreduction of molecular oxygen were studied in a carbon support-immobilized laccase system over a wide potential range. On the basis of the functions obtained, a reaction mechanism was proposed which includes electron transfer from the enzyme's active site to an oxygen molecule as the slow step at low values of polarization. Formation of an enzyme-substrate (laccase-oxygen) complex is the slow step in the limiting-current region. (Author abstract) 10 refs.

Bogdanovskaya, V.A. (Acad. of Sciences of the USSR, Moscow, USSR); Kuznetsov, A.M.; Tarasevich, M.R.; Gavrilova, E.F. *Sov Electrochem* v 23 n 3 Mar 1987 p 344-349.

**075760 OXYGEN ELECTROREDUCTION IN PERFLUORINATED SULFONYL IMIDES.** The electroreduction of oxygen in perfluorinated sulfonyl imides has been studied with the emphasis on the identification of alternate acid electrolytes which could replace the presently used phosphoric acid as an electrolyte in  $H_2$ - $O_2$  fuel cells. The activity for oxygen reduction on smooth platinum and gas-fed, high surface area platinum-catalyzed electrodes (10% platinum loading on XC-72 carbon support) has been examined. The polarization of the air cathode in the micro-fuel cell in bis(trifluoromethanesulfonyl)imide is 40 mV more positive compared to phosphoric acid at 100 mA  $cm^{-2}$ , presumably due to the increased solubility of oxygen and lower tendency of bis(trifluoromethanesulfonyl)imide to adsorb on the platinum catalyst. (Edited author abstract) 16 refs.

Razaq, M. (Case Western Reserve Univ., Cleveland, OH, USA); Razaq, A.; Yeager, E.; Desmarreau, Darryl D.; Singh, S. *J Appl Electrochem* v 17 n 5 Sep 1987 p 1057-1064.

**075761 KINETICS OF OXYGEN REDUCTION IN MOLTEN PHOSPHORIC ACID AT HIGH TEMPERATURES.** The solubility and diffusivity of oxygen in concentrated (98%) phosphoric acid, and the kinetics of its reduction on platinum within the 25°-150°C temperature interval have been investigated utilizing glass insulated Pt microelectrodes with radii of 12.7 and 250  $\mu m$ . The enthalpy of solution of oxygen in phosphoric acid was found to be  $2.2 \pm 0.3$  kcal  $mol^{-1}$ , and the entropy of solution is  $-12.6 \pm 0.8$  cal  $K^{-1} mol^{-1}$ . Fundamental entropy calculations indicate that the large negative entropy change upon solution is due to the loss of three degrees of freedom in translation (free translation becoming hindered) and two degrees of freedom in rotation (only libration occurs in solution). This work is of interest to fuel cells. (Edited author abstract) 44 refs.

Scharifker, B.R. (Texas A&M Univ., College Station, TX, USA); Zelenay, P.; Bockris, J.O'M. *J Electrochem Soc* v 134 n 11 Nov 1987 p 2714-2725.

**075762 OXYGEN REDUCTION KINETICS AT ACTIVE CARBONS WITH DIFFERENT SURFACE PROPERTIES IN SOLUTIONS OF INTERMEDIATE pH VALUES.** The model floating electrode was used to investigate the kinetics of oxygen reduction at KM-2 active carbons in simple and mixed solutions of NaCl,  $NH_4Cl$ , and  $NaH_2PO_4$ ; the carbons had been subjected to different surface treatments. The kinetic features of the reaction are found to be the same as in alkaline and acidic electrolytes. By variation of the surface group composition on the carbon the electrocatalytic activity can be varied by more than an order of magnitude in unbuffered neutral solutions, and by a factor of 3 to 4 in buffered solutions. (Edited author abstract) 7 refs.

**075763 ELECTROCHEMICAL REDUCTION OF OXYGEN ON SMALL PLATINUM PARTICLES SUPPORTED ON CARBON IN CONCENTRATED PHOSPHORIC ACID - I. EFFECTS OF PLATINUM CONTENT IN THE CATALYST LAYER AND OPERATING TEMPERATURE OF THE ELECTRODE.** Electrochemical reduction of oxygen on small platinum particles supported on carbon in 105 wt% phosphoric acid at 190°C was investigated by means of a half-cell apparatus. Effects of platinum content in the catalyst layer and operating temperature of the electrode on this reaction were examined. The flooded agglomerate model was supported as the operation mode of the porous gas diffusion electrode. From temperature dependence study of the reaction, apparent activation energy on the electrode was estimated to be about 113 kJ  $mol^{-1}$  at equilibrium potential. This work is pertinent to fuel cells. (Edited author abstract) 36 refs.

Maoka, T. (Toshiba Corp., Kawasaki, Jpn). *Electrochim Acta* v 33 n 3 Mar 1988 p 371-377.

**075764 ELECTROCHEMICAL REDUCTION OF OXYGEN ON SMALL PLATINUM PARTICLES SUPPORTED ON CARBON IN CONCENTRATED PHOSPHORIC ACID - II. EFFECTS OF TEFLON CONTENT IN THE CATALYST LAYER AND BAKING TEMPERATURE OF THE ELECTRODE.** A relation between hydrophobicity (or wettability) of a porous gas diffusion electrode for use in a phosphoric acid fuel cell and its cathode performance (activity toward electrochemical oxygen reduction) was examined. The hydrophobicity of the gas diffusion electrode was regulated by changing either the amount of Teflon (PTFE) content in the catalyst layer or baking temperature of the electrode. The Tafel slope for electrochemical oxygen reduction became twice as high as that of the ordinary electrode when the wettability of electrode toward phosphoric acid was high. This fact supports a flooded agglomerate model as the operation mode of this type of porous gas diffusion electrode. (Author abstract) 14 refs.

Maoka, T. (Toshiba Corp., Kawasaki, Jpn). *Electrochim Acta* v 33 n 3 Mar 1988 p 379-383.

**075765 OXYGEN REDUCTION ON THE Au (311) ELECTRODE SURFACE IN ALKALINE ELECTROLYTE.** Oxygen reduction was studied for the first time using a single crystal electrode in a rotating disc-ring arrangement. The Au (311) surface shows a complex behavior, with a very high activity in certain potential regions. The first electron transfer is rate determining in the region of 4-electron reduction. As with Au (100), a 4  $e^-$  reduction changes into a 2  $e^-$  process, which reverts back to a 4  $e^-$  reaction at very negative potentials. Based on a general reaction scheme of  $O_2$  reduction, a map of the operating potential dependent reaction pathways was constructed. Nearly 60% of the mass flux of  $O_2$  undergoes a direct reduction to  $OH^-$  in the region of mixed control. The high activity of Au (311) was ascribed to a high step density and  $AuOH$  present on its surface. (Author abstract) 23 refs.

**075766 SIMPLEX OPTIMIZATION OF ELECTROREDUCTION OF OXYGEN MEDIATED BY METHYL VIOLOGEN SUPPORTED ON ZEOLITE-MODIFIED CARBON PASTE ELECTRODE.** By using the methyl viologen-oxygen system as a model, zeolites Y and A were shown to be promising as supports for electrocatalysts, and perhaps as sites for preconcentration of substrates as well. Simplex optimization was used to reach a maximum catalytic peak current for the reduction of oxygen using a modified electrode consisting of carbon paste mixed with the sodium form of zeolite Y. The electrochemistry was carried out in aqueous lithium perchlorate solution buffered at pH 7.00. Four parameters were varied to give a maximum peak current due to oxygen reduction. The optimal response was obtained when the carbon paste electrode containing 49 wt% zeolite Y was immersed in a 32 mM solution of methyl viologen

in aqueous electrolyte solution saturated with oxygen. (Edited author abstract) 36 refs.

**075767 ELECTROCATALYSIS OF  $O_2$  REDUCTION TO WATER IN DIFFERENT ACID MEDIA BY IRON NAPHTHALOCYANINES.** The oxygen reduction kinetics have been investigated in different acid media by the RRDE and voltammetric techniques on iron naphthalocyanines. Better activity and stability were found in perchloric acid solutions. In most cases indirect four-electron pathway was shown. The reaction mechanism appears to be associated with a redox couple which should involve the central iron. Correlations can be established between the potential of the redox couple and the activity as seen by the RRDE technique. (Author abstract) 20 refs.

Coowar, F. (CNRS, Meudon Principal, Fr); Contamin, O.; Savy, M.; Scarbeck, G. *J Electroanal Chem Interfacial Electrochem* v 246 n 1 May 10 1988 p 119-138.

**075768 OXYGEN REDUCTION AT  $Pt_{0.65}Cr_{0.35}$ ,  $Pt_{0.2}Cr_{0.8}$  AND ROUGHENED.** Oxygen reduction in 0.5M  $H_2SO_4$  has been investigated at  $Pt_{0.65}Cr_{0.35}$ ,  $Pt_{0.2}Cr_{0.8}$  and at surfaces produced from them by selective dissolution of the Cr component. Rotating disk electrodes (RDE) were used to examine the oxygen reduction reaction (ORR). The published (1-2) surface analysis using x-ray photoelectron spectroscopy (XPS) combined with sputter profiling and Rutherford backscattering spectrometry (RBS) convincingly demonstrated that the surface region can be selectively depleted of the Cr component by electrochemical excursions to potentials positive of approximately +1.25V vs. RHE. For the more Cr-rich alloy very severe depletion (>500 Angstrom) occurs upon prolonged potential excursions above +1.25V. For the  $Pt_{0.65}Cr_{0.35}$  sample, the surface depletion extends about 2-3 monolayers into the surface. (Edited author abstract) 28 refs.

**075771 OXYGEN ENRICHMENT BY PRESSURE SWING ADSORPTION.** An automated experimental apparatus was built to study the PSA oxygen enrichment process. Mass flux and concentration of all streams connected to the adsorption bed were continuously monitored so that the transient behavior of the process could be examined. In particular, a four-step process operated under various production, pressurization, and blowdown rates was studied in detail. The experimental data were then compared with the simulation results of a simple, isothermal model. The adsorption isotherm and the mass-transfer rate constants used in the model were taken directly from literature data. The simulated and the experimental transient results were in reasonable agreement. (Edited author abstract) 21 refs.

**075773 CHARACTERISTICS OF LIMITING CURRENT-TYPE OXYGEN SENSOR.** Characteristics of oxygen sensors based on limiting current behavior of zirconia pumping cells have been investigated. To limit oxygen transport from ambient gas to the cathodes of the zirconia pumping cells, a drilled cover and a porous layer were examined. For the sensor with a diffusion hole of the drilled cover, the limiting current showed a considerable nonlinearity to oxygen concentration in a high oxygen concentration and a temperature dependence as  $T^{0.8}$  in oxygen-nitrogen mixtures. This behavior is in good agreement with that expected from a model in which the oxygen transport rate is limited by the diffusion hole. For the sensor with the porous layer, the sensor output indicated a weak temperature dependence and good linearity to oxygen concentration compared with the former sensor. This work is pertinent to automatic exhaust emissions. (Edited author abstract) 21 refs.

**075778 POTENTIOMETRIC SOLID-STATE OXYGEN SENSOR USING LANTHANUM FLUORIDE OPERATIVE AT ROOM TEMPERATURE.** A solid electrolyte oxygen sensor using an  $LaF_3$  single crystal was examined for detection of oxygen at room temperature. The potential of the sensing electrode relative to that of the reference electrode (e.m.f.) varied almost logarithmically with the oxygen partial pressure,  $P_{O_2}$ . While newly fabricated elements showed a very slow response, exposing them to water vapour at 150°C for 12 h followed by repetition of exposure to high and low  $P_{O_2}$  decreased the 90% response time to about 2 min even at room temperature. Both XPS and infrared spectra suggested the formation of a partially hydroxylated surface with the pretreatment. It was also found that the same sensor could respond sensitively to oxygen dissolved in water. (Author abstract) 15 refs.

## Spectroscopic Analysis

**075782 TIME-DEPENDENT STUDY ON THE ABSORPTION AND EMISSION SPECTRA OF  $O_2$ .** We use a time-dependent theory to investigate the absorption spectrum to the  $B^3\Sigma_u^-$  state. Also investigated is the emission spectrum corresponding to laser excitation to  $v'=4$  of the  $B^3\Sigma_u^-$  state of the  $O_2$  molecule. We present detailed discussion of the relationship between the dynamics and the resulting spectra and correlate our results with experimental data. (Edited author abstract) 18 refs.

**075783 VIBRATIONAL TO ELECTRONIC ENERGY TRANSFER FROM  $CO$  TO  $O_2$  IN RARE GAS MATRICES.** We reported recently the first clear evidence for intermolecular V-E transfer between molecular defects in RG matrices: a modulated low power IR color center laser pumps the first vibrational overtone of  $^{13}C^{18}O$  diluted in solid argon at 4.2K. Highly vibrationally excited CO molecules are produced by the fusion of vibrational excitations (anharmonic V-V pumping). Our previous work was concerned with  $CO/Ar$  samples where  $O_2$  was present as an impurity. New results are reported here after a systematic study on  $CO/O_2/Ar$  samples. 4 refs.

## Spectrum Analysis

**075785 FTIR-SPECTRA OF SOLID  $O_2$ ,  $N_2$  AND CO.** FTIR measurements of thin films of  $N_2$ ,  $O_2$  and CO at about 20 K contain a line due to the allowed or induced fundamental transition and a broad structure shifted to higher frequencies. This phonon sideband is explainable by coupling of lattice vibrations to the molecular fundamental vibration, and mirrors the weighted one phonon density-of-states. This IR-derived density-of-states can be compared with those from other experimental studies (neutron-scattering, Raman) and from theoretical models. (Author abstract) 17 refs.

**075786 TRANSPORT PROPERTIES OF OXYGEN IN AQUEOUS BORATE SOLUTIONS.** The solubility and diffusivity of oxygen in borate buffer solutions were studied on a Pt  $\mu$  electrode under diffusion-controlled conditions. The solubility of oxygen in diluted borate solution is unusually high ( $4.2 \times 10^{-3}$  Ml $^{-1}$ ), whereas its diffusion coefficient is lower ( $5 \times 10^{-6}$  cm $^2$  s $^{-1}$ ) than in other aqueous solutions. The decrease in oxygen solubility at higher ionic strengths is due to the salting-out effect. The results are consistent with the formation of 'oxygen-borate' complex whereby the stability of  $BO_3$  containing polymeric anions is enhanced. (Author abstract) 14 refs.

## Control Systems

**075789 NUMERICALLY CONTROLLED FLAME CUTTING MACHINE CAN PAY FOR ITSELF, EVEN IN SMALL AND MEDIUM SIZED COMPANIES.** Numerically controlled flame cutting machines have been known for several years. Major companies building ships, machines, containers or other steel products use the 'NC technique' (NC = Numerical Control) for controlling flame cutters. But can small and medium sized works also use this technique? An impressive example of the successful introduction of a numerically controlled flame cutter is that of a company with some fifty employees in the central Neckar conurbation. With its long tradition the company still calls itself an 'iron-works'; it is a member of the Chamber of Trade and was once the first user of flame cutting machines in this region. Today, as a manufacturer of welded constructions, it is an important subcontractor for companies dealing in specialized machinery. Part of the work-force is still used for flame cutting, not only for the company's own purposes but also carrying out flame cutting for others. Its long experience in the flame cutting of high-carbon steels (eg C 45, 42 CrMo 4 and 16 MnCr 5) and boiler-grade plate is particularly useful in this content. (Author abstract)

## OXYGEN CUTTING MACHINES

### Reviews

**075790 PIERCING TECHNIQUES IN OXYGEN CUTTING MACHINES.** The majority of the industrial applications of oxygen cutting necessitate piercing. However, this can damage the equipment and even risk destroying the nozzle and the blowpipe if the operation is not correctly carried out. Piercing is also an operation which takes time and uses gas and should therefore be avoided in so far as possible. However, piercing is often necessary because of the shape of the workpiece, for example a pipe collar. The purpose of this paper is to provide some general information on the piercing techniques to be adopted if one is to avoid ruining both the equipment and the material to be cut. In English and French.

**075791 ON OZONE ABSORPTION IN ALKALINE SOLUTIONS IN PACKED TRICKLE BED.** In this communication a different explanation of the underestimation is presented. The data of L. Rizzuti et al. are reviewed by taking into account the kinetic equation for the absorption of carbon dioxide in buffer carbonate-bicarbonate-arsenite aqueous solutions that has been recently proposed by V. Augugliaro and L. Rizzuti. Based on a discussion of experimental results from the work of others, the authors concluded that the procedure used by L. Rizzuti et al. (1976) for the determination of the  $O_3$ -OH $^-$  reaction rate constant, with the revision reported in this paper, leads to the correct value of the kinetic

constant. 10 refs.

## Decomposition

**075793 MECHANISM OF OZONE DECOMPOSITION IN WATER. THE ROLE OF TERMINATION.** The radical-chain mechanism of ozone decomposition in water is suggested. Addition of an extra chain termination step, i.e., reaction between superoxide and ozonide radicals, allowed the author to account for various reaction kinetic orders with respect to ozone and hydroxide ion concentrations reported in the literature, in particular the transition from 1.5 to 1 kinetic order for  $[O_3]$  at neutral pH. The rate constant of the proposed new termination reaction has been estimated to be between  $2 \times 10^2$  and  $1 \times 10^4$  dm $^3$ .mol $^{-1}$ .s $^{-1}$ . (Author abstract) 16 refs.

**075794 CHEMICAL REACTIONS OF OZONE AND THEIR ROLE IN DEVELOPING IMPROVED ANALYTICAL METHODS.** Most methods for the determination of ozone have been developed by utilizing, with or without modifications, existing methods for chlorine determination. The problem with this approach is that ozone chemistry is very different from chlorine chemistry. We believe that a detailed understanding of the mechanism of ozone decomposition and the chemistry of the byproducts is essential in order to develop selective methods for ozone. This paper briefly describes the ozone decomposition mechanism and introduces the concept of an 'Ideal Method'. The indigo method is examined as an 'Ideal method' and the automation of this method by Flow Injection is discussed. (Author abstract) 32 refs.

**075795 ESTIMATING THE IMPACT OF OZONE ON CROPS.** Several factors contribute to uncertainties in assessments of crop damage caused by exposure to ozone and other air pollutants. This study pinpointed some of these factors and developed a crop loss assessment model capable of providing more realistic damage estimates. Estimates of loss to soybean crops from ambient ozone levels were developed, using scenarios that considered combinations of various years, regions, varieties, and planting practices. In addition, eight dose-response functions related percent reductions in crop yields to ozone exposure. Estimates of soybean losses caused by  $O_3$  ranged from 1 to 7%, considerably lower than values of 11-16% obtained in previous research. The study attributes variations in results to several factors, including the dose-response equation selected for the analysis, the year and location examined, the agricultural practices, and the type of exposure statistics used. Double cropping produced smaller estimated losses than full-season production, and the use of total dose-exposure statistics yielded higher losses than the use of mean or percentile exposures. (Edited author abstract)

**075796 URBAN OZONE AND ITS PRECURSORS.** In urban areas, man-made emissions are overwhelmingly dominant over natural ozone sources. This article addresses the ozone problems of urban areas, emphasizing three important issues. The first concerns the form and level of the National Ambient Air Quality Standard (NAAQS); which directly affects the achievability of the standard, as well as confidence in its attainment. The second issue encompasses the trend in ozone concentrations, which is a measure of the effectiveness of existing ozone control strategies. The third entails the control strategies whose failure may reflect a deficiency in the understanding of the ozone problem or in the implementation of the strategies themselves. 38 refs.

**075797 PULMONARY RESPONSE TO OZONE EXPOSURES IN HEALTHY INDIVIDUALS AGED 55 YEARS OR GREATER.** Ten female and nine male subjects were exposed for 60 minutes in random order to one of the following  $O_3$  concentrations: 0.0, 0.2, or 0.3 ppm. The following pulmonary function tests (PFT) were recorded before exposure, and at periods immediately following and 20 minutes post-exposure: total respiratory resistance ( $R_T$ ), thoracic gas volume at functional residual capacity (FRC), and forced expiratory volume in one second ( $FEV_1$ ). Baseline PFT mean values and air exposure PFT mean values were compared through the use of repeated measure two-way analysis of variance to detect any significant effect of exposure on these parameters. Following 60 minutes of exposure at light intermittent exercise, there were no statistically significant pulmonary functional changes observed in male subjects. However, in female subjects, a statistically significant increase in  $R_T$  was observed. (Edited author abstract) 22 refs.

**075798 ATMOSPHERIC OZONE: FORMATION AND EFFECTS ON VEGETATION.** There is evidence to suggest that there are losses in the stratospheric  $O_3$  due to the updraft of  $O_3$  destroying pollutants generated by both natural processes and by human activity. Such a loss in stratospheric  $O_3$  can result in alterations of incidence in the ultraviolet (UV) radiation to the earth's surface. Tropospheric  $O_3$  is known to be highly phytotoxic. A number of experimental techniques are available to evaluate the chronic effects of  $O_3$  on plants. Among all field evaluation techniques, open-top chambers are the most frequently used method for evaluating the chronic effects of  $O_3$  on crops. Acute effects can be evaluated with less complexity through the use of biological indicator plants. Confounding the acute or chronic responses of plants to

$O_3$  is the presence of other kinds and forms of pollutants in the ambient atmosphere and the incidence of pathogens and pests. The resulting complex interactions and joint effects on plants are poorly understood. (Edited author abstract) 100 refs.

**075799 CFC/OZONE/GREENHOUSE ISSUES.** Chlorofluorocarbons (CFCs) play a major role in determining our standard of living. They are used in a number of essential applications, including refrigeration and air conditioning, medical instrumentation, and the production of insulating materials. One particular chlorofluorocarbon, CFC-113, is used as a high performance cleaning and drying agent in the electronics industry. CFCs are involved in two environmental debates: one concerning the protective layer of ozone which filters ultraviolet radiation from sunlight before it reaches the earth's surface and the other, the greenhouse effect and global warming controversy. This paper provides background information on these environmental issues and describes the current status of the regulation of CFC. (Author abstract) 4 refs.

**075801 EVALUATION OF THE EFFECTS OF OZONE INJURY ON RADIAL GROWTH OF PONDEROSA PINE (PINUS PONDEROSA) IN THE SOUTHERN SIERRA NEVADA.** Growth of ponderosa pines with visible symptoms of ozone injury was compared with that of asymptomatic trees in the southern Sierra Nevada, California. Time series analysis indicated that there was no significant reduction in annual radial increment of symptomatic trees during recent years compared to past growth of asymptomatic trees. First order autocorrelation and climatic variables accounted for a large proportion of the variance in growth index, and winter precipitation was positively correlated with growth for all size and age classes. Although ozone concentrations are high enough to cause chlorosis and premature needle senescence in ponderosa pine, there has been no significant change in growth associated with ozone injury. (Author abstract). 41 Refs.

Peterson, David L. (USDA, Riverside, CA, USA); Arbaugh, Michael J. *JAPCA* v 38 n 7 Jul 1988 p 921-927.

**075802 CALIFORNIA STATEWIDE ASSESSMENT OF THE EFFECTS OF OZONE ON CROP PRODUCTIVITY.** The California Air Resources Board (CARB). Initiated a Crop Loss Assessment program to develop a process whereby all available information could be put into a format usable for a statewide assessment of yield losses to crops from ozone. The yield loss information was used in conjunction with economic analysis to determine the impacts of different ozone/ambient air quality standards. The results to date indicate the usefulness of the process for general assessments of the effects of ozone on crop productivity, not only for California but potentially for other areas. Modifications in these projected loss estimates will be made as new information becomes available concerning loss equations, air monitoring sites, and growing seasons on a county and crop basis,

and for data collected after 1984. 32 Refs.

**075803 COMPARISON OF INDICES THAT DESCRIBE THE RELATIONSHIP BETWEEN EXPOSURE TO OZONE AND REDUCTION IN THE YIELD OF AGRICULTURAL CROPS.** The objective of this study is to compare the use of several indices of exposure in describing the relationship between  $O_3$  and reduction in agricultural crop yield. Hourly mean  $O_3$  concentration data, based on two-three measurements per hour, were used to develop indices of exposure from soybean and winter wheat experiments conducted in open-top chambers at the Boyce Thompson Institute, Ithaca, New York. None of the exposure indices consistently provided a best fit with the Weibull and linear models tested. The selection of the model appears to be important in determining the indices that best describe the relationship between exposure and response. The focus of selecting a model should be on fitting the data points as well as on adequately describing biological responses. The investigator should be careful to couple the model with data points derived from indices relevant to the length of exposure. Additional aspects of the study are discussed. (Edited author abstract).

Lefohn, Allen S. (A.S.L. & Associates, Helena, MT, USA); Laurence, John A.; Kohut, Robert J. *Atmos Environ* v 22 n 6 1988 p 1229-1240.

**075804 IMPACT OF OZONE ON THE GROWTH AND YIELD OF TREES: A REVIEW.** Data from 25 experiments on seedlings of 43 tree species and hybrids show that ozone ( $O_3$ ) can reduce growth and photosynthesis at concentrations common in many areas of the USA. Seedlings have been primarily employed for such studies for logistic reasons, and will likely provide the greatest breadth of information for some time to come. However, a number of impediments limit application of seedling response studies to assessment of impacts on regional timber production. Large trees differ from seedlings in a number of ways, including C allocation and canopy structure, and methods must be developed to account for these differences if information from seedling studies is to prove useful to forest impact assessment. Understanding how competition mediates individual tree responses require investigation of whether systematic differences of microclimate leaf morphology that exist across canopies affects foliage sensitivity to  $O_3$ , and whether the maximum growth rates of genotypes are correlated with susceptibility to  $O_3$ . (Edited author abstract). 90 Refs.

**075805 PULMONARY FUNCTION AND SYMPTOM RESPONSES AFTER 6.6-HOUR EXPOSURE TO 0.12 ppm OZONE WITH MODERATE EXERCISE.** Ten nonsmoking males (18-33 yr) were exposed once to clean air and once to 0.12 ppm  $O_3$  for 6.6 h. Exposures consisted of six 50-min exercise periods, each followed by 10-min rest and measurement; a 35-min lunch period followed the third exercise period. Exercise ventilation averaged approximately 40 L/min. Forced expiratory and inspiratory spirometry and respiratory symptoms were measured prior to exposure and after each exercise. Airway reactivity to methacholine was determined after each exposure.  $FEV_{1.0}$  was found to decrease linearly during the  $O_3$  exposure and was decreased by an average of 13.0 percent (591 mL) at the end of exposure. On forced inspiratory tests, the FIVC and FIV05 were decreased 12.6 and 20.7 percent, respectively. Increases in the symptom ratings of cough and pain on deep inspiration were observed with  $O_3$  exposure but not with clean air.

Airway reactivity to methacholine was approximately doubled following O<sub>3</sub> exposure. Additional aspects of the study are discussed. (Edited author abstract) 27 refs.

**075806 ALTERNATIVE OZONE DOSE METRICS TO CHARACTERIZE OZONE IMPACT ON CROP YIELD LOSS.** Previous studies of the National Crop Loss Assessment Network (NCLAN) relating the impact of ozone (O<sub>3</sub>) on agricultural crops have used the seasonal arithmetic average of O<sub>3</sub> for either a 7- or 12-h daily period as the measure of dose in the dose response relationships. This study investigated the use of alternative dose metrics that gave differential weighting to hourly O<sub>3</sub> concentrations according to level of O<sub>3</sub>, period of day, or total hourly solar radiation. Data were used from two NCLAN studies in which two different methods of O<sub>3</sub> addition were used for 7 h/d. In addition, one study included 12 h/d exposure for one method of O<sub>3</sub> addition. The residual sums of squares from fitting a common Weibull response model to each experiment were compared over the range of dose metrics. The results suggested that the dose metrics using equal weighting of peaks and valleys closely reflected plant reaction to O<sub>3</sub>, but the fit of the dose-response models improved if relatively little weight was given to the final 5-h component (1700-2200 h EDT) of the 12-h exposure period. Weighting by total hourly solar radiation gave results very similar to the best obtained from differential peak-valley weighting and 7 h:5 h weighting. (Author abstract) 12 refs.

## Manufacture

**075807 OZONHERSTELLUNG.** [Production of Ozone]. Ozone is one of the most powerful oxidizing agents. It is benign to the environment because when ozone is caused to react with other substances nothing but molecular oxygen is evolved apart from the oxidation products. This is a considerable advantage in comparison with other industrial oxidizing agents. The paper presents an outline of the use and production of ozone. (Author abstract) In German. 3 refs.

Kogelschatz, U. (Brown Boveri Forschungszentrum, Baden, Switz). *Elektrowaerme Int Ed B* v 45 n 3-4 Jun-Aug 1987 p 162-164.

**075808 OZONE GENERATION DURING PULSED BREAKDOWN OF GAS-LIQUID SYSTEMS.** The generation of ozone during pulsed breakdown of gas-liquid systems consisting of water and an oxygen-containing gas was investigated. The characteristics of the water and gas, parameters of the pulses, design of the electrodes, and methods of introducing the gas into the liquid were varied. The maximum yield of ozone was obtained with jet introduction of the gas from the zone of the maximum electric field strength. In this case energy expenditures for obtaining ozone from oxygen were 9 kWh/kg and from air 13 kWh/kg. The technical-economic expediency of ozonization of water by pulsed breakdown of gas-liquid systems is shown. (Author abstract) 8 refs.

**075810 PHOTOCHEMICAL GENERATION OF OZONE: PRESENT STATE-OF-THE-ART.** This paper reflects an investigation of the feasibility of photochemical generation of ozone by irradiating gases containing oxygen with Hg lamps of the highest performance and emitting the 185 nm line. Besides the expected photostationary equilibrium, determining factors for practical yields in ozone generation by the 185 nm wavelength are the reactor and gas temperature, the reactor geometry, and the gas composition, as well as the pressure. Further developments are expected in the field of lamp construction and also improvement of reactor geometry. A better knowledge of the aging of the lamps is required, as well as of the photochemical reactions of oxygen in the technologies applied. Systems presently available are most promising for application on small scale or in areas of public water distribution which have no developed structures. (Edited author abstract) 20 refs.

Dohan, J.M. (Brussels Waterboard, Brussels, Belg); Maschelein, W.J. *Ozone Sci Eng* v 9 n 4 1987, 1986 Workshop on Ozone & Ultraviolet Radiat Water Treat, Amsterdam, Neth, 1986 p 315-334.

Measurements See Also ATMOSPHERIC COMPOSITION—Remote Sensing.

**075811 SATELLITE REMOTE SENSING AND OZONESONDE OBSERVATION OF OZONE VERTICAL PROFILE AND SEVERE STORM DEVELOPMENT.** Two year ozonesonde data, January 1981 to December 1982, observed at four Canadian stations, two-and-a-half year backscattered ultraviolet experiment data on the Nimbus-4 satellite, April 1970 to August 1972, observed over five U.S. stations, were used to study the relationship between the total ozone, vertical distribution of the ozone mixing ratio, height of half the total ozone, and the variation of local tropopause height. In view of the correlation between the variation of the tropopause height and the possible development of severe storms, a better understanding of the effect of the vertical distribution of the local ozone profile on the variation of the tropopause height can give considerable insight into the development of severe storms. (Author abstract) 25 refs.

Monitoring See Also IMAGE SENSORS—Calibration.

**075812 CHARACTERIZATION OF OZONE DATA FOR SITES LOCATED IN FORESTED AREAS OF THE EASTERN UNITED STATES.** Six years (1978-1983) of ozone monitoring data from sites located within six forested areas were examined. Areas that experienced the lowest to the highest ozone exposures were located in (1) northern New England/New York and upper Great Lakes, (2) New York/Pennsylvania/Maryland, (3) southeastern/southern, and (4) New Jersey pinelands. Recommendations for additional ozone monitoring sites are made. A concentrated effort should be made to examine ozone monitoring data from subsequent years (1984, 1985, and 1986) to explore whether the 6-year period 1978 through 1983 is representative of the annual variability of ozone concentrations over eastern forested areas. To better understand the relationship between ozone exposure and possible forest effects, we recommend that the temporal distributions of elevated ozone concentrations over a growing season be examined. The occurrence of elevated ozone levels during specific growth periods during a season may be an important aspect that

biologists may wish to explore. (Edited author abstract) 22 refs.

**075813 ANALYSE DES REGIMES ET DES ZONES DE LA DECHARGE COURONNE EN TERMES DE PRODUCTION D'OZONE.** [Analysis of Regimes and Zones of Corona Discharge from the Point of View of Ozone Production]. Ozone production by corona discharge in air is analyzed as a function of current pointing out the characteristic current ranges with relation to the discharge regimes. Taking into account the temporal evolution of the discharge, microscopic parameters are analyzed for each range and correlated with the elementary processes of ozone formation. The study allows an interpretation of experimental results for ozone production in the various discharge regimes. The conclusions may also be used as starting points for designing more efficient reactors. (Author abstract) In French. 23 refs.

**075814 OZONE GENERATION IN THE 214-nm PHOTOLYSIS OF OXYGEN AT 25°C.** Ozone formation in the 214-nm photolysis of oxygen at pressures ranging from 380 to 1300 Torr was investigated. The rates of ozone formation increase with the square of oxygen pressure mirroring the pressure dependence of the absorption cross sections of oxygen. This observation demonstrates the importance of the collision-induced changes in oxygen absorbance and points to a need to examine the role of oxygen dimer (O<sub>2</sub>)<sub>2</sub> in reactions initiated by its photodissociation. Because of the high dilution of ozone, its formation was found to be linear with time even though, on the average, its rate of photolysis exceeded the rate of its generation from oxygen. The quantum yield of ozone formation was 1.86±0.17 independent of O<sub>2</sub> pressure. (Edited author abstract). 38 Refs.

## Synthesis

**075815 USE OF THE THERMAL AND ELECTRONIC EFFECT IN A COLD PLASMA REACTOR FOR OZONE SYNTHESIS.** Air or pure oxygen flowing into the discharge gap of a cold plasma reactor is the primary method for ozone production on commercial scale. The modelling of the conversion of oxygen into ozone has been set up by means of a kinetic scheme in which opposite reactions are considered. The forward reaction occurs via electronic activation, while the reverse reaction is temperature-dependent. Experimental results are in accord with this scheme, and lead to the following primary conclusions: the plasma temperature is a linear function of the applied power, while isothermal operation is preferable from an economic point of view. The ozone molecule formed and destroyed in the cold plasma is suggested to be O<sub>3</sub>(<sup>3</sup>B<sub>2</sub>), i.e., the first electronic excited state of ozone (triplet state). (Edited author abstract) 11 refs.

**075816 OZONE SYNTHESIS FROM OXYGEN IN DIELECTRIC BARRIER DISCHARGES.** A comprehensive model of ozone generation in dielectric barrier discharges is presented. The model combines the physical processes in the micro-discharges with the chemistry of ozone formation. It is based on an extensive reaction scheme including the major electronic and ionic processes. The importance of excited atomic and molecular states is demonstrated. Theoretical limits are given for the ozone production efficiency and the attainable ozone concentration. The most important parameters influencing the performance of ozonizers are identified. All theoretical predictions are compared to measured data. (Author abstract) 53 refs.

## Design

**075817 SPECIALIST PACKAGING.** It is no good winning and completing an important contract if the finished product reaches the client in a damaged state. Product packaging must be correctly designed to withstand the rigors of transportation and storage. One of the pace-setters in the field of specialist packaging in the U.K. has been the Ministry of Defence (MoD) which lays down rigorous standards for products packaged, transported and stored on its behalf. The article discusses these, along with design requirements, packaging materials, and other aspects of the subject.

Anon. *Engineering (London)* v 228 n 5 May 1988 Tech. File No. 166, 2p.

**075818 STRUCTURAL ANALYSIS OF VISUAL FORM ON PACKAGING GRAPHICS AND ITS USE IN AN AUTOMATED DESIGN SYSTEM.** The objective of the paper is to construct a computer system which automates the design procedure in the field of commercial graphics of packaging boxes. To automate the design process a structural analysis of the graphics has been done. It is found that there is a name region of the product and a picture region which indicates somehow the packaged content. The sample graphics which have already been printed are gathered. Their structures are converted into numerical forms which are stored in the files of the computer system as a data base. In the design phase a designer gives a few key words to the computer. Then, it draws an appropriate number of samples from the data base which cover the key words. Using an arithmetic averaging operation and a majority decision rule the computer proposes a composed graphics on a color graphic display. Starting from this graphics, the designer is able to correct or change parts of the graphics in a man-machine interactive manner. (Author abstract). 5 Refs.

**075819 MECHANICAL STRESSES ON PRODUCTS DURING AIR CARGO TRANSPORTATION.** A field study was conducted on board a Boeing 747 Combi (freight and passenger) aircraft on the route Stockholm (Arlanda) via Oslo (Gardermoen) to New York (John F. Kennedy Airport) and return to Stockholm (Arlanda). Shock and vibration, acting on the cargo,

during air transportation were measured and analyzed. The study encompassed all phases of the flight, including taxiing, climb, cruise during both calm and turbulent conditions, descent and approach, landing including touchdown and taxiing to apron. The field data were analyzed by conventional frequency analysis and modeling techniques. In order to generalize the results, flight recorder data from the field trial and from other flights are included. A. 14 Refs.

## Efficiency

**075820 GILLETTE: EFFICIENCY UP, REJECTS DOWN.** A unique process improvement project has triggered major increases in output and decreases in reject percentages on one high-volume line in the St. Paul manufacturing facility of the Personal Care Div. of the Gillette Co. Prior to the project, the efficiency of this line was approximately 45 per cent. The project has increased line efficiency to 72 per cent, with individual shift results as high as 92 per cent. With eight machines in-line, operating at these high efficiencies is no mean feat. Another accomplishment has been a drastic reduction in defects produced. The major reason for the improvement in the line's performance is a change in the attitude of the people who worked on the line. A number of specific machinery and operational improvements took place - and at some cost.

Holmgren, R. Bruce (Packaging, Newton, MA, USA). *Packaging (Boston)* v 33 n 1 Jan 1988 p 50-52, 54.

## Materials

**075821 PLASTICS AND METALS: CHOICES IN PACKAGING.** In packaging, there has been a drive towards convenience products, particularly in food. More recently, the development of microwave cooking has served to accelerate this process. This paper explores some of the ways in which choices have been established. Following an initial discussion on the package requirements for both food and non-food products, examples have been drawn from recent Metal Box developments to illustrate how desired objectives are achieved, at the same time setting new standards.

## Quality Assurance

**075822 MILITARY PACKAGING IN THEUK TODAY.** Equipment for the Defence Services is daily becoming more expensive and more sophisticated and it therefore has to have a high reliability to enable the serviceman to have confidence in it. Therefore the quality and design of packaging coupled with its cost effectiveness is everyone's business whether he be in design, development, production, purchasing, supply management, operational maintenance, storage, distribution or quality assurance and the aim must be that 'packaging is as important as the material it contains'. The paper outlines the way in which the packaging needs of the British Army, Navy and Air Force are met by the Central Packaging Unit (CPU) of the Ministry of Defence (MOD). The equipment for testing is briefly described and the main R&D projects outlined. (Author abstract).

## Shock Problems

**075823 APPLICATION OF PRODUCT FRAGILITY INFORMATION IN PACKAGE DESIGN.** An overview is given of a six step product and package test and development procedure which has become standardised in recent years. A case history is presented. An electronic product, a blood pressure analyser, encountered failure rates of 40% in shipment. Application of the six step procedure reduced damage in shipment to 0.1% over the next year. This averted potential warranty replacement costs of 2,000,000 dollars over the next year. The steps include: shipping environment definition; product fragility assessment; shock; vibration; product redesign, cushion material evaluation, package system design; prototype package system testing.

**Structural Design** See **VIBRATIONS**—Analysis.

**Tamper Resistant** See Also **FOOD PRODUCTS**—Packaging.

**075824 TAMPER-RESISTANT YET CONVENIENT: SOLVING A DESIGN DILEMMA.** Manufacturers of Over-the-Counter (OTC) drugs and some consumer products are in a quandary. On the other hand, they must make packaging, containers, and closures secure enough to be tamper-resistant and child safe. At the same time, the Consumer Product Safety Commission has challenged them to create packaging that is easy for the elderly and handicapped to open. Tampering indications based on sight, sound and smell are the latest developments.

Huckins, Linda. *Des News (Boston)* v 43 n 12 Jun 22 1987 p 20-21.

## Trademarks

**075825 DER GEWERBLICHE RECHTSSCHUTZ IM BEREICH DES VERPACKUNGSWESENS: 1. TEIL: EINORDNUNG UND KENNZEICHNUNG-SRECHE.** [Protection of Industrial Property in the Field of Packaging. I. Classification and Marking Laws]. The legal norms described by the concept of the protection of industrial property protect commercial-intellectual work and the related, particularly economic, interests. In this paper, following a correlation of industrial protection laws with design concepts in the packaging industry, a survey is made of a group of property protection laws, i.e., marking laws. In this context the trademark law, protection of the product format and protection of the firm are discussed. An attempt is made to provide criteria concerning the selection of the right marking law for the user. (Edited author abstract) In German. 5 refs.

Laufhütte, Dieter. *Verpack Rundsch* v 38 n 12 Dec 1987 p 89-92.

**PACKAGING MACHINES** See Also **SUGAR HANDLING**—Packaging.

**075826 NEW LINE HITS PEAK OUTPUT.** An all-new line for the blister packaging and cartoning of physicians' samples at Stuart Pharmaceuticals, Newark, DE, now consolidates in one place a series of operations previously spread around the plant or performed by outside contractors. The central feature of the new line is its use of two Uhlmann cartoners, with a distinctive cartoner-to-cartoner transfer. The latter has a vertical storage magazine that provides a 40-second reserve, to keep feeding the second cartoner if the first cartoner makes a momentary stop. This helps assure a sustained output of 200 blisters cards a minute.

Holmgren, R. Bruce (Packaging, Denver, CO, USA). *Packaging (Boston)* v 32 n 12 Oct 1987 p 52-54.

**075827 CARTONING MACHINES: HOW MUCH HIGH-TECH?** Most packagers interpret the traditional view of state of the art as a high-speed cartoner, rugged enough for round-the-clock operation, with electronic adjustments and changeovers, as well as a diagnostic system that fits into a full-scale management information system. Implicit in this description is the use of latest carton handling and product collation techniques, among others, including a magazine of maximum capacity.

Holmgren, R. Bruce (Packaging, Denver, CO, USA). *Packaging (Boston)* v 32 n 12 Oct 1987 p 60-63.

**075828 CUT-SIZE PAPER PACKAGING OF THE '80S AND BEYOND.** A new design concept has been developed for each piece of equipment in the packaging line. The traditional gearhead motors have given way to direct-drive dc and ac servo motors, and the old relay panels have been replaced by the more versatile programmable logic controllers. The packaging line has also been reconfigured. Product flow patterns have become straighter, keeping abrupt changes in direction at a minimum. All of these improvements raise productivity by increasing efficiencies, decreasing maintenance, and improving product flow. Finally, precision sheeters and high-speed packaging lines are linked by an 'electronic' lineshaft that matches the ream wrapper speed to the discharge speed of the sheeter. (Edited author abstract).

## Efficiency

**075830 DOSIERGENAUIGKEIT VOLUMETRISCH ARBEITENDER FUELLSYSTEME IN VERTIKALEN SCHLAUCHBEUTELMASCHINEN.** [Dosing Accuracy of Volumetric Filling Systems in Vertical-Pouch Machines]. Manufacturers of packaging machines try to reach a maximum dosing accuracy with the highest possible number of cycles. This requires good knowledge of the filling behavior of the product and the way in which it is influenced by the machine. Therefore, the factors influencing the dosing accuracy in vertical-pouch forming, filling and sealing machines using both cup dosing and auger filling equipment are investigated. The identified dosing inaccuracy was caused in most of the cases by fluctuations of the bulk density of the filling product. This may result from compression of the product in the supply container and in the dosing cups or from particle breakage in the auger feeder due to a grinding effect. This effect can be avoided only if the filling product is stable enough against grinding or if the particle size is fine enough compared to the dimensions of the auger feeder. The homogeneity of the filling product is also of great importance. An improvement in the dosing accuracy in an auger filler can be achieved mainly by a narrow particle size distribution of the product. In cup dosing

equipment, however, it can also be achieved by structural changes. (Edited author abstract) 2 refs. In German.

Vogelpohl, H. (Technische Univ Muenchen, Munich, West Ger); Hohmann, H.J. *Verpack Rundsch* v 39 n 1 Jan 1988 p 1-6.

**075831 FILLING CHARACTERISTICS AND DOSING ACCURACY OF VOLUMETRIC DOSING DEVICES IN VERTICAL-FORM-FILL-SEAL MACHINES.** Filling from cups with different opening mechanisms and filling systems using an auger have been examined, and the dosing accuracy found in all instances to be more dependent on variations in the bulk density, general particle shape and size etc. of the product being filled than on the dimensions etc. of the filling device. Results are reported on many of the possible characteristics in an attempt to find the relevant one(s) but it is concluded that our knowledge of product characteristics is insufficient and that more research is required. (Edited author abstract). 1 Ref.

## PACKAGING MATERIALS

### Adhesion

**075832 ASSURING SUCCESSFUL BONDING TO CARTON BOARDS.** This paper considers the factors that will influence successful adhesive bonding to carton-boards. Although the paper assumes the use of carton-board within the packaging industry, the majority of the arguments may be applied to other bonding applications. The commonest adhesive types used within the packaging industry for carton-boards are PVA-type emulsion and hot-melts. Other adhesives used will include animal glues, starches and dextrines, acrylics etc. Although these adhesives vary considerably in properties they share the majority of requirements for successful bonding. The paper firstly considers bond structure and the basic modes of bond failure. The paper then discusses the properties required of boards, board surfaces (be they printed, varnished, coated or otherwise) and adhesives for the successful manufacture of bonds. Techniques for evaluating trial bond performance and, finally, the need for good 'housekeeping' are considered. (Edited author abstract) 6 refs.

### Classification

**075833 PACKAGING AND ASSEMBLY MATERIALS SPECIFICATION GUIDE.** In Electronic Manufacturing's Packaging and Assembly Materials Specification Guide, contributing companies have described their products used in assembling through hole printed wiring boards. These include epoxy, silicone, urethane, acrylic, and parylene conformal coatings; solders in a wide range of formulations; and heat sink compounds in liquid and pad form. Details are given in the conformal coating section about both one and two component coatings, their primary function, application and curing method, and how they can be removed. Bar, core, and preform solders are featured in the guide to solders, for wavesoldering, reflow, ultrasonic, drag, dip, etc. Heat sink compounds described include both unfilled and mineral filled greases; those in pad form include adhesive and non-adhesive elastomers, treated papers and fabrics, and polyimide films, among others.

Anon. *Electron Manuf* v 33 n 17 Nov 1987 p 38-44.

### Coatings

**075834 CHEMICAL PRIMING FOR EXTRUSION COATING.** During extrusion coating, a 100%-solids molten polymer is applied on a substrate. Most substrates require priming to promote adhesion of the extrudate. The discussion in this article focuses on the use of chemical primers. While chemical priming enhances adhesion, it can also improve package performance under unusual conditions. Such conditions can arise either from the outside environment or from the product inside the package. A given chemical primer can also provide some special property of its own to the total package, such as improved barrier performance or better heat resistance.

Isbister, Roger (Morton Thiokol Inc, Chicago, IL, USA). *Tappi J* v 71 n 5 May 1988 p 101-104.

### Composite Materials

**075835 COMPOSITES OFFER NEW OPPORTUNITIES.** The author describes some of the latest developments in composite packages - those which make use of paper and board products in association with plastics and metal foils. (Edited author abstract)

**075837 OPTIMIERUNG DES KLEBSTOFFAUFTRAGS IM SACKBODENLEGER. TEIL 1: KONTINUIERLICHER AUFTRAG AUF UNGEFALTETE PAPIERBAHN MIT GLATTEN MODELLWALZEN.** [Optimization of Glue Application in a Paper Sack Bottomer. I: Continuous Application on Flat Paper Web, Using Smooth Application Rolls]. The mechanism of application of a commercial cold water soluble starch glue on stepped and folded sack papers has been studied on a pilot gluing bottom machine. The machine was equipped with a conventional, gluing system. The influence of the relevant process parameters, e.g. the paper speed, velocity and velocity-ratio of the rolls, the roll distances, the material and the surface characteristics of the stereotypes, the glue viscosity, etc., on the time- and position-related glue thickness uniformity has been evaluated. The relations between the parameters has been quantified and from the data the glue thickness uniformity during the application has been optimized. The results make possible the determination of suitable parameter ranges for the thickness control systems. In this article, the results of the investigations of a continuous glue application with smooth, interrupted application rolls on unstepped papers are discussed. (Edited author abstract) 21 refs. In German.

**075842 LE CONDITIONNEMENT POLYETHYLENE: UNE AFFAIRE D'INNOVATION.** [Polyethylene Packaging: A Question of Innovation]. The world market for polyethylene should continue to increase by about 4-5% per year. This progression will mainly concern technical and special products, in particular films for packaging. The Finnish group Neste Oy has specialized in this new sector, and placed on the market polyethylenes and EVA copolymers adapted for traditional packaging

applications, while improving on classical polymers. The firm has produced barrier HDPE, whose impermeability is twice that of standard HDPE. This group has also developed a transparent grade of HDPE, which directly competes with normal HDPE and bi-oriented polypropylene. Composite production has also benefited from research and the various grades of LLDPE, MDPE and EVA, EVA copolymers comply particularly well with specifications for packaging. (Edited author abstract) In French.

Anon. *Rev Gen Caoutch Plast* v 64 n 674 Dec 1987 p 47-49.

**075843 SPECIALTY POLYOLEFINS USE IN FLEXIBLE PACKAGING APPLICATIONS.** In 1985, flexible packaging applications consumed some 5.2 billion pounds of polyolefin resins. This marked an increase of almost 300 million pounds over usage in 1984, and is an increase of 1.7 billion pounds from 1980. This growth came as a result of polyolefins replacing traditional packaging materials. Discussion in this paper is limited to three groups of specialty polyolefins: reactive tie-layer materials; very low density polyethylene (LDPE); and specialty polyethylene copolymer materials.

**075844 NEW CRYSTALLIZABLE COPOLYESTER FOR ELEVATED TEMPERATURE USE.** Eastman Chemical Products, Inc. is marketing this new Copolyester 6761 for dual-ovenable use - a resin which can be used in food reconstitution, cooking and baking at temperatures 50 to 75°F above those now recommended for CPET trays. The new copolyester is based on chemistry which permits manufacture of a crystallizable product with a crystalline melting permits manufacture of a crystallizable product with a crystalline melting point of 545°F. Trays made from the resin, properly nucleated and stabilized, can be frozen and stored at temperatures of -20°F without embrittlement and can be used for cooking at oven settings of 450°F without concern for tray distortion and thermal variations in an oven.

Stras, Joseph (Eastman Chemical Products Inc, Kingsport, TN, USA); Weaver, James C. *J Plast Film Sheeting* v 3 n 3 Jul 1987 p 207-214.

**075845 EFFECT OF RELATIVE HUMIDITY ON THE PERMEABILITY OF TOLUENE VAPOUR THROUGH A MULTI-LAYER COEXTRUDED FILM CONTAINING HYDROPHILIC LAYERS.** The effect of relative humidity on the diffusion of toluene vapour through a multi-layer coextrusion film structure containing moisture sensitive hydrophilic barrier layers (nylon and EVAL) was evaluated. Two experimental test methods were employed. In Method I, the effect of relative humidity on the diffusion of toluene vapour was evaluated, where the test film was preconditioned to a fixed water activity prior to test. In Method II, the effect of water vapour as a co-permeant was evaluated. Studies carried out by Method I showed the concentration dependency of the diffusion process and the importance of relative humidity on the diffusion of organic vapour through barrier structures. Water vapour was found to exhibit strong interactive effects with the moisture sensitive polymer layers of the laminate, which resulted in an increase in the diffusion of toluene vapour through the barrier structure. (Edited author abstract) 25 refs.

**075848 IN-LINE-PRODUKTION WARMGEFORMTER VERPAKKUNGEN.** [In-Line Production of Thermoformed Packaging]. Now that in-line plants have proved themselves for thermoforming, primarily of tubs and similar parts, this process is also being employed for thin-walled packages. The necessary technical equipment and the economic advantages are described. (Author abstract) In German and English.

Bratsch, Kurt (Kiefel Thermoform-Maschinen, Freilassing, West Ger). *Kunstst Ger Plast* v 78 n 5 May 1988 p 402-406.

**075849 PACKAGING GOES PLASTIC INTO THE 21ST CENTURY.** Among the many promising markets for plastics, packaging may top the list. Growth projection for plastic packaging vary a bit from one source to the next. SPI forecasts an average annual volume growth rate of 4 percent through the year 2000. Future economic factors will favor plastics. By the year 2000, the use of plastic packaging will hit about 50 percent of the total market. Plastics will replace competitive packaging materials at an annual rate of 10 percent. According to Du Pont's Jenkins, the general category of foodstuffs that may convert to plastics by the year 2000 are oxygen-sensitive foods and beverages. Retortables may soon take off. Environmental concerns are the most formidable obstacle for future growth.

Fitzgerald, Kevin R. (Plastics World, Newton, MA, USA). *Plast World* v 45 n 10 Sep 1987 5p.

**075850 DEVELOPMENTS AND APPLICATIONS OF RECYCLED PLASTICS.** The problems associated with the growing proportion of plastic packaging materials in community domestic refuse have generated public concerns. Furthermore, an increasing number of laws are being proposed to address the solid waste - many targeted at plastic packaging. This was the background for the conference 'Recycled Plastics: Developments and Applications'. Speakers examined the latest developments and discussed recycling methodologies, marketing approaches, social and environmental implications. This report summarizes the main points made. (Edited author abstract).

Lai, Christopher C. (Michigan State Univ, East Lansing, MI, USA); Lai, C.; Selke, Susan E. *Pack Technol Sci* v 1 n 3 Jul-Sep 1988 p 157-160.

**075851 MULTILAYER PACKAGING CONTAINERS.** The author discusses the production of multilayer bottles in the United States, as this technology is likely to grow most rapidly during the next five years. The four major classes of products that are packaged in bottles or other rigid forms are: polypropylene, polyvinyl chloride, high-density polyethylene (HDPE) and, polyethylene terephthalate (PET). Nearly all multilayer bottles used commercially combine backbone structural layers of HDPE or polypropylene for strength and rigidity with a thinner barrier layer of a different polymer. The polymers that are strong barriers to oxygen permeation also tend to be efficient barriers to permeation by hydrocarbon liquids. Bottles made by the laminar-blend process have nylon arranged as many discontinuous and overlapping platelets dispersed within a matrix of HDPE resin that also

contains a compatibilizing polymer to promote adhesion of HDPE to nylon. The laminar-blend extrusion blow molding process is discussed. 11 Refs.

Sacks, William (Stevens Inst of Technology, Hoboken, NJ, USA). *CHEMTECH* v 18 n 8 Aug 1988 p 480-483.

**075852 PLASTICS IN PACKAGING.** A discussion is presented of Indian standards for plastics. An examination is made of the different packaging modes where plastics are being used: rigid containers, flexible packs and fabric packs. Their common applications and the relevant Indian Standards available are discussed. Flexible packaging is discussed. It is shown that the present trend in packaging is towards a changeover to plastics from the traditional packaging materials. In plastics also, flexible packs (up to 1 litre size) have an edge over rigid containers, being lighter, which results in cost reduction. Besides being functional in protecting the contents of a container from moisture, oxygen and loss of aroma, packaging in plastics has the ability to improve the aesthetics due to variety of colours and ease of decoration of packs through modes like multicolour printing.

Dorairaj, V. (Polyolefins Industries Ltd, Thane, India). *Chem Age India* v 39 n 3 1988 p 165-167.

**075853 PVC: PACKAGING ISSUES AND REGULATIONS.** A review is presented of the FDA's revised proposal for the regulation of PVC food packaging issued in 1986 and some recent developments that have further delayed FDA's issuance of a rule that would lead to the use of PVC in liquor bottles. Despite significant technological improvements in the manufacture of rigid PVC, which has led to drastic reduction of residual vinyl chloride monomer (RVCM) to safe levels, FDA action on PVC has remained stalled. It is concluded that final action by FDA may well depend not on scientific principles, but on the Agency's ability to effectively reconcile the correct scientific, health and legal solutions with the political pressure being exerted by environmentalist groups. (Edited author abstract). 10 refs.

de la Cruz, Peter L. (Keller & Heckman, Washington, DC, USA). *J Vinyl Technol* v 10 n 3 Sep 1988 p 117-120.

**075854 PVC PACKAGING RECYCLING.** This study examines the recyclability of PVC bottles into other PVC products. Post consumer bottles can potentially be granulated and used, without further treatment, in the production of these products. Washing will allow the granulate to recover most of the properties of the original bottle compound, by removing paper labels and residual product contamination. Plastic contaminants, such as those from caps and other plastic bottles, show little effect on several physical properties at levels up to 3%. This granulate can thus be used as a significant portion of the raw material feed for a number of PVC products including DWV (drain/waste/vent) pipe, pipe fittings, rigid sheet, bottles, etc. (Edited author abstract). 10 refs.

## Steel

**075855 ECCS EXPANDS HOOGOVENS' PACKAGING STEEL COMMITMENT.** Hoogovens IJmuiden has recently commissioned a new electrolytic chromium/chromium-oxide coating line to further increase its strength in the packaging steel sector. The line uses high current density (HCD) technology for the first time in Europe and represents an investment of £17M. Hoogovens has three electrolytic tinning lines, which process more than 500,000t of packaging steel every year. The contribution of packaging steel to the turnover of Hoogovens IJmuiden amounts to about 24%, indicating the high added value on these products.

Anon. *Steel Times* v 216 n 4 Apr 1988 p 208, 210.

**Testing** See Also NUCLEAR FUELS—Packaging.

**075856 DATABASE OF PACKAGING LABORATORY TEST EQUIPMENT.** The paper reports a recent data base produced for, and available to, National Packaging Centres in developing countries. The ITC in Geneva hold the material which is updated regularly. It should enable enquirers to ascertain details of the equipment they require and to choose between several alternatives. (Author abstract)

Salisbury, John. *Pack Technol Sci* v 1 n 2 Apr-Jun 1988 p 73-75.

**075857 MEASURING OXYGEN TRANSMISSION RATES OF PACKAGING FILMS UNDER HUMID CONDITIONS.** Producers of highly water-sensitive materials being used in food packaging, such as the ethylene vinyl alcohol copolymers, have had to devise methods for measuring gas transmission rates, particularly that of oxygen, under humid conditions. Some of the in-house procedures being used include some form of humidifying the gas streams, a technique taken from the standard methods used to specify dry gases. Other methods are the so-called 'sandwich' technique and the new H-system by Modern Controls. Currently, only limited data are available for comparing the techniques. When enough data can be collected with good precision between laboratories, a method can be supported for approval as a standard. (Edited author abstract). 5 Refs.

## PACKING

### Accident Prevention

**075859 GEFAHRENERMITTLUNG AM BEISPIEL DES ASEPTISCHEN ABPACKENS.** [Determination of Risks with Aseptic Packing Procedures as an Example]. The starting point to take precautions against risks is the determination of hazards. A company utilizing aseptic packing equipment is obliged to determine the hazards emanating from these devices in order to take precautions for the health protection of employees. The measuring procedure presented in this study assists companies to meet this requirement, i.e. to perform measurements. This strategic conception enables companies to maintain limit values characterizing health protection by the performance of a few specific measurements only. Furthermore, an analysis method which can be carried out without difficulties is described. Thus, the expenditure of measurements ascertaining that maximum workplace concentrations are not exceeded is low. (Author abstract) In German. 4 refs.

Schutz, Albrecht. *Staub Reinhalt Luft* v 47 n 9-10 Sep-Oct 1987 p 223-226.

### Calculations

**075860 CALCULATION OF STUFFING BOX SEALS HAVING AN EXPANDING CHAMBER.** The authors examine the effect on the computation character-

istics of static friction along the two surfaces limiting the packing under the assumption that no friction occurs between the packing and one limiting surface (chamber). Experiments were performed to check the validity of the theory. It is shown that for optimum utilization of the properties of the packing and its shrinkage upon tightening of the stuffing box, the chamber should have two cylindrical sections. The studies show that the procedure for calculating stuffing box seals with different sealing materials can also be used for calculating stuffing box seals of a modified design. 5 refs.

**Materials** See Also SEALS—Materials.

**075861 PACKING OPTIONS FOR ROTATING EQUIPMENT.** A variety of new packing materials has been developed as a result of the potential loss of asbestos. Presented are some packing selection guidelines. Some of the topics discussed include compression packing design, synthetic fiber utilization, packing ratings in various media, and fiberglass alternatives.

Ferland, R.H. (Robco Inc, Pittsburgh, PA, USA). *Hydrocarbon Process* v 67 n 4 Apr 1988 p 39-41.

**075862 NEW COMPRESSION PACKINGS AIM TO REPLACE ASBESTOS.** Material development for compression packings is the key to the solution of critical sealing problems in pumps, especially now that asbestos - formerly the material of choice - can no longer be considered. This article reviews the performance of a variety of compression-packing materials operating in various gases, liquids, and solvents. The materials discussed include braided Teflon ribbon, Teflon yarn, Kevlar yarn and texturized fiberglass.

Ferland, R.H. (Robco Inc, Pittsburgh, PA, USA). *Power Eng (Barrington Ill)* v 92 n 7 Jul 1988 p 28-31.

**Physical Properties** See HEAT EXCHANGERS—Components.

## PACKING PLANTS

### Effluent Treatment

**075863 TREATMENT OF SLAUGHTERHOUSE WASTEWATERS IN STABILIZATION PONDS.** A sampling program was devised to assess in terms of 5-day biochemical oxygen demand (BOD<sub>5</sub>), chemical oxygen demand (COD) and suspended solids (SS) removal the performance of one anaerobic, one facultative and two maturation ponds in series, for treating the wastewater resulting from a slaughterhouse killing approximately 625 pigs/week. The results show that, in spite of poor maintenance, which has been causing bank erosion and macrophyte infestation, the system has coped with large variations in flow and organic load, reducing to a minimum the impact of the effluent discharge on the receiving creek. (Author abstract) 2 refs.

**PAINT** See Also BRIDGES, STEEL—Protective Coatings; HEAT TRANSFER—Convection; PHYSICAL CHEMISTRY—Mathematical Models; PIGMENTS—Grinding; STEEL SHEET—Painting; VALVES AND VALVE GEAR—Plastics Applications.

**075864 METHOCCEL AND COLOR ACCEPTANCE OF LATEX PAINTS.** In this study, 30 interior flat paint formulations thickened with hydroxypropyl methylcellulose were made. Each paint contained a different latex. The paints were tested for color acceptance at 120 degrees F with several universal colorant systems. Excellent color acceptance was observed even with the time-honored

'finger rub up' test. Color difference values 'E' were less than one. The latexes evaluated are commercially available acrylics, vinyl acrylics and polyvinyl acetates from eight different manufacturers. (Edited author abstract) 2 refs.

Blake, Donald (Dow Chemical USA). *J Water Borne Coat* v 10 n 4 Nov 1987 p 17, 20.

**075865 ELECTRICAL INDUCTION OF PATTERNS IN METALLIC PAINTS.** A technique for electrically orienting metallic flakes in a wet paint layer using a corona current has been developed. The flakes are oriented perpendicular to the substrate, and a substantial color variation results. The resolution of the affected area is limited by the size of the flake, beam spreading due to space charge, and diffusion of the ions that constitute the corona current. Lines of 1-mm width are easily obtained. No contact with the wet paint layer is required, and the technique is fast and easily automated. The orientation is a result of competition between an induced electric torque and a viscoelastic torque. (Edited author abstract) 7 refs.

Inkpen, Stuart L. (MIT, Cambridge, MA, USA); Melcher, James R.; Jeganathan, Pradeep K. *Ind Eng Chem Res* v 27 n 1 Jan 1988 p 58-64.

**075866 APPLICATION OF THE COULOSTATIC IMPULSE TECHNIQUE FOR THE EVALUATION OF METALLIC SUBSTRATES WITH PAINT COATINGS IN ARTIFICIAL SEA WATER.** A coulостatic impulse technique used as an accelerated, nondestructive, and repetitive test to determine the anticorrosive properties of systems made up of a metal substrate, paint scheme, and electrolytic solution was implemented, together with an equivalent electric circuit representing the interface studied. The systems employed were several dummy cells and a steel sheet which was coated with two types of paints and submerged in sea water. Experimental results obtained for both systems perturbed by equivalent, minimum electric charges were quite similar and reproducible. In addition, they conformed with the results arrived at from calculus using the theoretical resolution of the equivalent electric circuit. By means of a simple, rapid, and nondestructive electrochemical method, the technique provides the ability to differentiate the corrosion protective properties of different organic coatings protecting a metallic substrate from contact with an aggressive electrolytic medium. (Author abstract) 27 refs.

**075867 SALT CONTENT AND ITS TRANSPORT THROUGH EPOXY-POLYAMIDE HYDROPHOBIC FREE FILMS.** The influence of the external salt concentration on the salt content and flux was determined for a normal ratio resin curing agent. These data showed an independence of the salt content and flux on the external concentration, pointing out the existence of a salt exclusion phenomenon. From experiments on permeation for different ratio resin curing agents it was possible to analyse its influence on the salt flux. This data showed an increase of the salt flux with increase of the polyamide content. (Edited author abstract) 18 refs.

## Additives

**075868 NEW GENERATION OF WATER-BASED THICKENER.** A unique water-based thickener, an organophilic clay produced by the surface treatment of bentonite clay with proprietary organic chemicals, has been developed. It is in the form of an aqueous slurry and can be used in a wide range of pH. In contrast to cellulosic thickener, it is not subjected to microbial degradation. Its rheological properties (pseudoplasticity and thixotropy) make it an excellent rheological additive for controlling application properties in aqueous coating systems. When used in latex paint it suspends pigment, imparts good flow

and leveling, improves sag control, and improves spatter resistance. It also improves hiding which will result in less consumption of TiO<sub>2</sub>. Comparisons against paints thickened with HEC and several associative thickeners are presented. (Edited author abstract) 3 refs.

**075869 EIGENSCHAFTEN VON ALUMINIUMOXID C UND SEINE WIRKUNGEN IM PULVERLACK.** [Properties of Aluminum Oxide C and its Effects in Powder Paint]. Aluminum oxide C is a highly dispersive product used, among other things, as a flowing aid and for increasing the positive electrostatic charge in powder. The effect on the electrostatic charge is of special significance in powder paints which can be applied by triboelectrically. (Edited author abstract) In German. 11 refs.

Ettinger, M. *Metalloberflache* v 41 n 9 Sep 1987 p 429-431.

**075870 INTRODUCTION OF A NOVEL, NONMETALLIC FUNGICIDE FOR THE COATINGS INDUSTRY.** Paint films are subject to fungal attack, which leads to cosmetic disfigurement, deterioration of the paint itself, and possible loss of adhesion. Fungicides are incorporated into coatings to prevent these deleterious effects and to prolong the life and usefulness of the paint. After many years of development work, a new fungicide based on novel chemistry specifically designed for use in coatings to protect against mildew defacement has been introduced. This paper reveals the chemistry of this new compound, the developmental history, and the superior performance characteristics through the presentation of both laboratory and field evaluation data. Comparisons with fungicides currently on the market are shown. The form in which the compound will be commercially available is reviewed, as well as its favorable toxicity profile. (Edited author abstract) 5 refs.

Dalton, Dennis L. (Cosan Chemical Corp, Carlstadt, NJ, USA). *J Coat Technol* v 60 n 761 Jun 1988 p 45-53.

**075871 VISCOELASTIC MEASUREMENT OF ORGANOCCLAY RHEOLOGICAL ADDITIVES FOR LATEX PAINT.** Rheological additives contribute to the viscoelasticity of an aqueous paint composition. In this study with organoclay thickeners and other commercially available thickeners, a correlation of spatter resistance and elastic moduli was observed. The improved spatter resistance of sagging, and flow and leveling organoclay-thickened paint can best be interpreted by the elastic moduli. The article relates viscoelastic parameters, storage modulus, loss modulus and complex viscosity to spatter, sagging, and flow and leveling of two types of paints. One is an acrylic latex enamel and the other is an interior latex wall paint. (Edited author abstract).

**Adhesion** See Also ADHESION; COATINGS—Testing; GALVANIZED METAL—Painting.

**075872 ADHESION OF PAINTS. IS THIS YOUR PROBLEM?** A discussion is presented of phosphating and chromating as techniques for treating surfaces to improve adhesion of paint. Coating application techniques are also discussed. Film drying is examined.

Brown, Lawrie. *Finishing* v 12 n 6 Jun 1988 40p.

**Antifouling** See Also COPPER COMPOUNDS—Desorption; TIN COMPOUNDS—Environmental Impact; TIN COMPOUNDS—Toxicity.

**075873 SEARCH FOR ANTIFOULANT ALTERNATIVES.** There is little doubt that tributyl tin (TBT)-based paints will be the subject of severe restrictions, if not complete elimination. The questions of appropriate alternatives and time of action, however, still remain. It is shown that antifoulants capable of replacing

the organotin biocide tributyl tin are available. The author cited, in particular, a copper-based ablative, tin-free antifoulant which equals and, in some cases, exceeds the performance of the TBT copolymer. Another antifoulant cited is an antibiotic called Compound-X, the advocates of which speak highly of its present performance and also of potential contributions.

Clark, Michael K. (Sea Technology, Arlington, VA, USA). *Sea Technol* v 28 n 10 Oct 1987 p 37-40.

**075874 NONTOXIC ALTERNATIVES TO ANTI-FOULING PAINTS.** All antifouling paints in use today are effective because toxic ingredients based on heavy metals are included in their formulation. The dominant toxins are cuprous oxide and triphenyl of tributyl derivatives of tin. The steady accumulation of these metals in the marine environment has adversely affected marine life, and restrictions on the use of tin-based antifouling paints now exist in the United Kingdom and France, and are under consideration in the United States. An alternative to a toxic coating is a nontoxic fouling release coating which weakens or eliminates the adhesive bond between fouling organisms and the coating. The fouling would then be dislodged by relatively weak mechanical forces, such as those arising from the motion of the ship through the water. This paper describes the formulations of the coatings, their application to five vessels, and their performance to date. (Edited author abstract) 26 refs.

Brady, R.F. (US Naval Research Lab, Washington, DC, USA); Griffith, J.R.; Love, K.S.; Field, D.E. *J Coat Technol* v 59 n 755 Dec 1987 p 113-119.

**075875 USE OF CALCIUM RESINATE IN THE FORMULATION OF SOLUBLE MATRIX ANTI-FOULING PAINTS BASED ON CUPROUS OXIDE.** Antifouling paints based on calcium resinate, calcium resinate/chlorinated rubber and WW rosin/chlorinated rubber were formulated and made in a laboratory ball mill of 3.3-l capacity. The experimental results of immersion raft trials (26 months) were statistically treated (factorial design 2×2×2×3×4, 96 samples prepared and tested in duplicate) and the conclusions then correlated with binder acid values obtained from laboratory analysis. The study showed the influence of composition variables (type of soluble resinous material, resinous material/chlorinated rubber ratio and binder content) and also the importance of some manufacturing variables (order of incorporation of the resinous material and toxicant, and cuprous oxide dispersion time) on the biocidal characteristics of the paints. (Edited author abstract). 17 refs.

Giudice, Carlos A. (CONICET, La Plata, Argent); Del Amo, Beatriz; Rascio, Vicente J.D. *Prog Org Coatings* v 16 n 2 Aug 1 1988 p 165-176.

**075876 ANTIFOULING PAINTS OF THE EMULSION TYPE BASED ON CUPROUS OXIDE.** Forty eight emulsified antifouling paints based on cuprous oxide were tested using oleoresinous binders constituted by bleached linseed oil-ester gum/rosin plus alkyl resin. Studies were made on the influence of binder composition, type of protective colloids and extenders, cuprous oxide content and film thickness on antifouling efficiency. Antifouling paints were applied over sandblasted steel protected by a vinyl wash primer and three coats of anticorrosive paint and tested in the sea during 18 months (including two periods of intense fouling). Trials gave encouraging results due to the good bioactivity with binders constituted by linseed oil-ester gum/rosin and corn starch as protective colloids. (Edited author abstract) 5 refs.

**Applications** See PLASTICS—Painting.

**Chlorinated Rubber** See Also STEEL—Painting; TRAFFIC SIGNS, SIGNALS AND MARKINGS.

**075877 WATER CONTENT AND TRANSPORT**

**THROUGH CHLORINATED RUBBER HYDROPHOBIC FREE FILMS.** As the result of observations using scanning, transmission and contrast phase microscopies as well as mercury porosimeter measurements and a porosity technique using  $\text{CuSO}_4$  in an acid medium, it is possible to propose a model in which the chlorinated rubber films are described as constituted by two phases,  $\alpha$  and  $\beta$ . The  $\alpha$  phase corresponds to the surface cured in contact with air and is continuous and homogeneous. The  $\beta$  phase contains void zones. The flux data showed that the water transport is dependent of film thickness, independent of the substrate and independent of the water activity outside the film. These results are discussed. 9 refs.

**Components** See Also STEEL STRUCTURES—Protective Coatings.

**075878 ISOPARAFFINS IMPART BENEFICIAL PROPERTIES TO COATINGS.** Synthetically produced isoparaaffins possess lower surface tensions than most other solvents. Employment of these isoparaaffinic solvents in solvent blends and in paint formulations reduces their surface tensions, which enhances their ability to wet substrates. In water-borne coatings, foam generation is reduced when isoparaaffins are used at low concentrations, alone or together with conventional antifoam agents, with no sacrifice in odor or performance. Higher-boiling isoparaaffins offer the added benefit of extending wet-edge time for these water-borne coatings. (Author abstract) 7 refs.

**Curing** See Also OVENS, INDUSTRIAL; STEEL—Painting.

**075880 MEASURING PAINT CURE QUANTITATIVELY.** Evaporative rate analysis is an analytical technique which provides the user with a rapid, quantitative instrumental test method for determining the state of cure of a painted surface. Using a microcomputer based analytical instrument, the technique performs the measurement in less than two minutes. The technique is based on solvent/swell diffusion phenomena resulting from a small droplet of a preformulated test solution which the instrument deposits onto the surface to be tested. A commercially available epoxy paint was chosen to demonstrate the applicability of the technique. 3 refs.

Slover, Charles C. (Meseran Co, Chattanooga, TN, USA). *Met Finish* v 85 n 10 Oct 1987 p 27-29.

**075881 KAWASAKI HEATS UP PRODUCTION.**

Motorcycles, all-terrain vehicles and Jet Ski recreational watercraft are produced by the Lincoln, Nebraska manufacturing plant that was established in 1974 as part of Kawasaki Motors Corporation, USA. When the popularity of Jet Ski watercraft led to larger sales, a production bottleneck was traced to paintcuring. In order to bring parts to required temperatures faster, the company installed a catalytic flameless infrared oven. In catalytic flameless infrared heating systems, natural gas is brought into contact with a catalyst in the presence of oxygen. The resulting reaction oxidizes the natural gas into water vapor and carbon dioxide, generating heat at the same time.

**Electric Conductivity**

**075885 INVESTIGATION OF ELECTRICAL RESISTIVITY-PIGMENT VOLUME CONCENTRATION RELATIONSHIP IN CARBON BLACK FILLED CONDUCTIVE PAINT.** Carbon black filled conductive paints are very useful for antistatic and EMI shielding applications. However, there is a certain limit to the conductivity that can be achieved. In this work, the relationship between electrical resistivity and carbon black loading of dry paint films was investigated. It is shown that the volume resistivity of these paints is proportional to the cube root of the volume concentration of the carbon black pigment and that the upper limit of

the volume conductivity attainable corresponds to the CPVC of the formulation. Beyond this point, conductivity decreases due to void formation in the dry paint film. (Edited author abstract) 19 refs.

Calahorra, Arie (RAFAEL-Armament Development Authority, Haifa, Israel). *J Coat Technol* v 60 n 757 Feb 1988 p 25-30.

**Electrodeposition** See Also PAINTING—Electrodeposition.

**075886 ELECTRODEPOSITION OF PAINT IN CARBON BLACK FILLED SYSTEMS.** Electrodeposition of paint (EDP) has been investigated with the aid of electrochemical methods using four various binders pigmented with five various carbon blacks (c.b.) in the concentration range of 0-25 weight percent (w/o) (in the solid). Electrodeposition itself is not influenced at low to medium c.b. concentrations, where ionic wet films resistivity is even slightly enhanced by single particles dispersed in the binder. At a relatively high critical c.b. concentration  $C_w$ , where strong electronic conductivity in the wet film is initiated due to the formation of linear agglomerates of c.b. particles, heavily deteriorated deposits are produced with warts at the surface. In the stoved film, electronic conductivities are in the range of  $10^{-9}$ - $10^{-5}$   $\text{cm}^{-1}$ . Percolation sets in at extremely low c.b. concentrations in the order of 1 W/O. (Edited author abstract) 35 refs.

**Failure** See Also COATINGS—Adhesion.

**075887 MODERN TECHNIQUES FOR THE ANALYSIS OF PAINT FAILURES.** The investigation of paint failures is important for a number of reasons. Identification of the cause of failure can determine the liability, if any, for repair or recoating and can provide a guide to the most effective remedial treatment. In addition, study of many failures can lead to a deeper insight into the mechanisms by which coatings adhere to and protect the underlying substrate. In this paper, several paint failure investigations are described, showing how in some cases the cause of failure may become obvious using low magnification optical microscopy, while in others a more advanced technique, Scanning Electron Microscopy (SEM) with Energy Dispersive X-ray (EDX) analysis, has proved extremely effective.

**Latex** See Also PIGMENTS—Agglomeration.

**075888 HEAT AND MASS TRANSFER IN LATEX PAINTS DURING DRYING.** Latex paint apparently dries in two stages. The first, when the evaporation rate of water is largely constant, occurs while an evaporative surface, separating the 'dried' layer from the still wet layer, moves towards the substrate. Evaporation during this stage depends on ambient conditions and can be modeled well by heat and mass transfer calculations. The drying slows to zero in the second stage, when the water supply for evaporation is depleted. A simple model for the second stage, that links evaporation rate with decreasing concentration of water, completes a good representation of the whole drying curve. (Author abstract) 15 refs.

**075889 METHOCCEL AND COLOR ACCEPTANCE OF LATEX PAINTS.** 30 interior flat paint formulations thickened with hydroxypropyl methylcellulose were made. Each paint contained a different latex. The paints were tested for color acceptance at 120 degrees F with several universal colorant systems. Excellent color acceptance was observed even with the time-honored 'finger rub

up' test. Color difference values 'E' were less than one. The latexes evaluated are commercially available acrylics, vinyl acrylics and polyvinyl acetates from eight different manufacturers. 2 refs.

## Manufacture

**075890 FLOW AND FILM PROPERTIES OF COATINGS CONTAINING MICROGELS.** Microgels have been prepared via an emulsion polymerization process involving the use of the amphiphilic oligosulfate, ZEO. The particle sizes of these microgels were < 100 nm and particle properties such as crosslink density, copolymer composition and functionality could be varied over a wide range. Their versatility and usefulness as coating modifiers has been demonstrated. Dispersions of the microgels are stable in both aqueous and organic media. Furthermore, solid powdered microgels can be produced by drying the emulsions. These powdered microgels are generally added to photoreactive coatings or can be redispersed in the above media. Such microgels may be applied in various other fields besides coatings because of the diversity of their form and properties. (Author abstract) 4 refs.

**075891 QUALITY CONNECTION IN PAINT MANUFACTURING.** Quality is more than just a trendy word at Rockford Coatings; it is a way of life. Quality is emphasized throughout all operations, from checking incoming raw materials to testing paints before shipment. Rockford Coatings approaches quality in two ways, according to Mel Meyer, vice-president and general manager. 'First, we emphasize quality throughout the plant. Second, we design quality standards around end-user requirements. Our testing is designed to check the coatings against whatever processes the customer is using.'

**075892 HAZARDOUS WASTE MINIMIZATION: PART III. WASTE MINIMIZATION IN THE PAINT AND ALLIED PRODUCTS INDUSTRY.** This paper looks at waste minimization practices available to the paint and coatings industry. The paper begins with an introduction to the industry and a description of the products. The steps involved in the manufacture of paints and coatings are then described. The paper then identifies the wastes generated. Source reduction and recycling techniques are the predominant means of minimizing waste in this industry. Equipment cleaning wastes are the largest category of wastes, and the paper concentrates on equipment and techniques available to reduce or eliminate these wastes. Techniques are described to reduce the other wastes from manufacturing operations. The paper concludes with a discussion of changing industry product trends and the effect that these trends will have on the generation of waste. (Author abstract) 6 refs.

## Mixing

**075893 PAINT MIXERS FOR DILUTING ANTI-BURN-ON DRESSINGS.** Anti-burn-on pastes are usually diluted to the necessary consistency in paint mixers with a shaft speed of about 60 rpm and a frame-type agitator. This sets up a tangential flow pattern in the mixer; the mixture rotates in a mainly horizontal circular path with little vertical or radial mixing. For the more efficient dilution and mixing of pastes in the foundry, one should use a bladed paint mixer with reflection

surfaces and raise the shaft speed to about 200 rpm.

**075895 KINETICS OF THE RELEASE OF 2,3,5,6-TETRACHLORO-4-METHYLSULFONYL PYRIDINE (TMP) FROM UNPIGMENTED FILMS.** The rate of the loss of 2,3,5,6-tetrachloro-4-methylsulfonyl pyridine (TMP) from unpigmented acrylic films was studied using kinetic equations developed for the release of a soluble material from a planar controlled-release device. For unencapsulated TMP, the rate of solution was greatly reduced when incorporated into the films which were cast from an acrylic latex and dried for 24 hr. Additional dry times, up to three weeks, did not significantly reduce the release rate. The 95% confidence interval for the release of unencapsulated TMP was found to be  $17.71 \pm 10.33$  percent/min<sup>1/2</sup>. The 95% confidence interval for the release rate of the microencapsulated TMP was  $4.42 \pm 2.40$  percent/min<sup>3/4</sup>. The F ratio was used to demonstrate that the reduction of the release rate by microencapsulation was statistically significant. The rate of release of TMP was also found to vary in proportion to the solubility of the TMP in the extraction solvent. Based on these results, the unpigmented acrylic latex film was characterized as a porous, monolithic controlled-release device. (Author abstract) 14 refs.

## Production

**075896 THEORY FOR THE DEAGGLOMERATION OF PIGMENT CLUSTERS IN DISPERSION MACHINERY BY MECHANICAL FORCES. I.** An equation quantifying the total probability,  $P_T$ , for an agglomerate of pigment or filler particles to be dispersed in a dispersion medium is derived. This total probability is shown to be the product of two separate, partial probabilities: the probability  $p_p$ , with which the agglomerates encounter a potentially active dispersion site, and the probability  $p_e$ , that enough energy per unit volume (energy density  $E/V$ ) is available to overcome the forces holding the agglomerates together. The total probability,  $P_T$ , is brought into connection with measurable paint properties, i.e., tinting strength development. (Author abstract) 13 refs.

Winkler, J. (Sachtleben Chemie GmbH, Duisburg, West Ger); Klinker, E.; Dulog, L. *J Coat Technol* v 59 n 754 Nov 1987 p 35-41.

**075897 THEORY FOR THE DEAGGLOMERATION OF PIGMENT CLUSTERS IN DISPERSION MACHINERY BY MECHANICAL FORCES. II.** An equation quantifying the probability for agglomerates to be dispersed in a dispersion machine from a previous paper is applied quantitatively to a continuously operated bead mill and a high-speed impeller. The effective volume per time unit is computed for various dispersion conditions in these devices. In addition, the fraction of energy used for dispersion is estimated. Effective volumes per second were found to be in the order of a magnitude of 1%

of the total volume filled with paint. The transfer of the energy onto the agglomerates takes place with an efficiency of approximately 1%. (Author abstract) 5 refs.

Winkler, J. (Sachtleben Chemie GmbH, Duisburg, West Ger); Klinker, E.; Sathyanarayana, M.N.; Dulog, L. *J Coat Technol* v 59 n 754 Nov 1987 45-53.

**075898 THEORY FOR THE DEAGGLOMERATION OF PIGMENT CLUSTERS IN DISPERSION MACHINERY BY MECHANICAL FORCES. III.** The effects of temperature and viscosity on the colloidal and mechanical aspects of pigment dispersions are viewed. The total amount of work mediated onto the mill bases during dispersions is not suitable to characterize the degree of deagglomeration. There is evidence that, in most dispersion machinery, the deagglomeration is governed by the shear stress within the mill base. This suggests that shearing type mechanisms are far more important than smashing type stresses for dispersions. Examples for the qualitative utilization of the total probability function,  $P_T$ , describing the dispersion process are given. (Author abstract) 39 refs.

Winkler, J. (Sachtleben Chemie GmbH, Duisburg, West Ger); Dulog, L. *J Coat Technol* v 59 n 754 Nov 1987 p 55-60.

## Quality Control

**075899 FILTERING KEY TO PERFECT CAR FINISH.** Paint manufacturing cleanliness and housekeeping standards must ensure that paint mixing equipment, piping, drums, tanks and transportation systems are free of contamination. Closed systems are used to the greatest extent possible, and all containers are tightly shut during transportation. Containers must be 'super clean.' Purchase specifications for drums or tote tanks are to medical standards. Cleaning procedures for the containers are explicit and demanding. Filtration is often used throughout paint-making. The choice of filtration is based on the nature and volume of the contaminant to be removed.

**075900 KRYOGEN-ENTLACKUNG MIT TITELN.** [Cryogenic Paint Removal by Means of Titelen]. Cryogenic paint removal possesses interesting features both from the ecological and economical viewpoints for removing paint from metal parts. This technique is used with various methods for conventional alkyd melamine stoving systems and air-dried synthetic resin or nitrocellulose lacquers. None of these methods, however, can be used with powder paint coatings. A suitable procedure was obtained by developing a primer called Titelen, which consists of natural proteins and is capable of swelling, thus making it possible to separate the paint coat from the part. (Edited author abstract). In German.

Morgenstern, Norbert. *Metaloberflaeche* v 41 n 8 Aug 1987 p 369-370.

**075901 REDUCTION OF TOTAL TOXIC ORGANIC DISCHARGES AND VOC EMISSIONS FROM PAINT STRIPPING OPERATIONS USING PLASTIC MEDIA BLASTING.** Three depainting methods were compared for their ability to strip Army communications shelters: chemical stripping, sandblasting, and plastic media blasting (PMB). Each process was studied with respect to the economics, the environmental impact, and the quality of the product. The purpose of this study was to determine if the PMB method is applicable to Army communications shelters and whether it would be advantageous for the Army to convert to this procedure both from the perspective of process efficiency and pollution reduction. The PMB process was determined

superior to the chemical stripping process and marginally better than sandblasting based upon the evaluation criteria. This report presents study results of the three methods evaluated and compares their respective efficiencies, processing costs, and waste generation. (Edited author abstract)

Wolbach, C.D.; McDonald, C. *J Hazard Mater* v 17 n 1 Dec 1987 p 109-113.

**075902 DILEMMA OF REMOVING LEAD-BASED PAINT.** This article describes the problems associated with removal of lead-based paints from bridges, the range of solutions being considered, research and Federal regulations. Two general strategies can be employed in an attempt to comply with hazardous waste disposal regulations. One involves using abrasive blasting together with capture and containment techniques. The other involves alternate surface preparation techniques without abrasive where the volume of waste that must be disposed of is diminished. 13 refs.

Hower, Harold E. (Journal of Protective Coatings & Linings, Pittsburgh, PA, USA). *J Prot Coat Linings* v 5 n 1 Jan 1988 p 30-37.

**075903 LEAD-PIGMENTED PAINTS-THEIR IMPACT ON BRIDGE MAINTENANCE STRATEGIES AND COSTS.** The removal, containment, recovery, and disposal of lead-pigmented paints is fast becoming one of the most critical cost items in steel bridge maintenance. The article examines the problems associated with the removal of lead-based paint and assess impacts on maintenance strategies and cost. It is concluded that for the majority of bridges, lead-paint debris does not pose a significant threat, but for certain urban bridges, it is necessary to carefully monitor and control the wastes. There is no proven cost-effective technology for the removal and containment of lead-based paint. Further equipment development is recommended. The Federal Highway Administration (FHWA) designated the removal of lead-containing bridge paint as a High Priority National Program Area. The immediate result of this was a symposium/workshop organized on the removal of lead-based paint, held February 29-March 1, 1988, and March 2-3, 1988, respectively. The main findings of the symposium/workshop are summed up. 7 refs.

Peart, John W. *Public Roads* v 52 n 2 Sep 1988 p 47-51.

## Selection

**075904 1988 PAINT AND COATINGS SELECTION AND COST GUIDE.** This paper updates and expands the authors' previous papers designed to assist the coatings engineer or specifier in identifying suitable paint and coating systems for specific industrial atmospheric environments, calculating current approximate installed costs and life for each, and establishing economic justification for their selections. In addition to cost factors for new construction and its normal maintenance, the 1988 edition includes maintenance painting conditions and cost factors covering varying degrees of rusting, pitting, and old paint breakdown. Generic classes of products and systems have been updated and expanded from 74 to 98 of the most commonly used protective coating systems, with particular emphasis on surface-tolerant coatings and those containing high-solids, volatile organic compound (VOC)-conforming products. Top-coated galvanized, and zinc metallized systems are included for comparison. 8 refs.

**075905 SELECTING COATINGS FOR INDUSTRIAL PAINTING.** Selecting coatings is an important and critical aspect in the corrosion protection of structural facilities. The first part of this paper describes some of the general considerations for selection of a coating. Many agencies, both private and public, have developed coating selection schemes which enable the owner's representative to systematically select coatings for specific structures.

These guidelines, called engineering standards, are based upon the types of structures at the agency's facilities. Development of such standards is discussed in the second part of this paper. 4 refs.

Appleman, Bernard R. (Journal of Protective Coatings & Linings, Pittsburgh, PA, USA). *J Prot Coat Linings* v 5 n 6 Jun 1988 p 30-41.

**075906 GENERIC COATING TYPES: THEIR CHARACTERISTICS AND USES.** This article describes liquid-applied (usually by brush, roller, or spray) coating and lining materials that are commonly used for corrosion protection in atmospheric or immersion service. The coating systems discussed are categorized by generic type of binder or resin and grouped according to the curing or hardening mechanism inherent with that generic type. While the resin or organic binder of the coating material is most influential in determining the resistances and properties of the paint, the type and amount of pigments, solvents, and additives such as rheological aids, etc., may also influence the application properties and protective capability of the applied film. Hybridized systems can be formulated that are crosses between the categories. 7 refs.

**Spectroscopic Analysis** See SPECTROMETERS, INFRARED—Accessories.

## Synthesis

**075907 USE OF SMALL POLYMERIC MICROVOIDS IN FORMULATING HIGH PVC PAINTS.** Since the introduction of opaque polymers to the coatings industry, many paint manufacturers have successfully used this small polymeric microvoid technology to lower their total raw material costs, while maintaining the quality of their paint formulation. This trend has recently accelerated due to increased prices for titanium dioxide, improvement in opaque polymer technology, and the move to uniform sales of paint by volume rather than weight. In the highly competitive interior paint market, these key properties include color, hiding, and washability. (Edited author abstract) 6 refs.

**Testing** See PIGMENTS—Testing.

## Thermal Effects

**075908 THERMOCHROMIC PAINTS AND PRINTING INKS.** Major advances in liquid crystal technology have made thermochromic paints and printing inks suitable for a wide range of industrial and commercial uses. The chiral nematic thermochromic crystals now produced are said to be sufficiently stable and reproducible for uses on a wider scale than any previous product of this type. Available as a 33% by weight micro-encapsulated liquid crystal suspension in water using gelatin/gum arabic coacervate walls crosslinked with an aldehyde, a thermochrome is, for the first time, available as a raw material for easy incorporation into any waterbased paint or ink. Chiral nematic thermochromes are micro-encapsulated using the well-known and available National Cash Register (NCR) oil process. The chiral nematics available from BDH Ltd. overcome the problems associated with cholesteryl esters. Once micro-encapsulated, the chiral nematics have far superior ultraviolet light resistance, although they remain vulnerable to attack by solvents.

**075910 MAGNETIC PARTICLE INSPECTION OF FERROMAGNETIC PARTS PAINTED.** The feasibility of magnetic inspection of ferromagnetic parts painted is described. And the relationship between the thickness of a paint and the depth of a crack is determined by experiments. (Author abstract) In Chinese.

Ding, Guantang; Miao, Shouren. *Wusun Jiance* v 9 n 6 Jun 1987 p 156-157.

## Thinners

**075911 INFLUENCE OF THINNER ADDITION ON BRUSHABILITY AND SAGGING OF HIGH BUILD ANTICORROSIVE PAINTS.** The objective of this paper was to establish rheologically the influence of thinner addition on the workability and sagging of high build anticorrosive paints of the same composition but with different thixotropic agent content (castor oil). Anticorrosive paints were prepared with a binder based on chlorinated rubber and, plasticized with 42% and 70% chlorinated paraffin. Zinc tetroxochromate, red iron oxide and barytes were employed as pigments. After pigment dispersion, castor oil gel was incorporated. The results of a rheological test allowed the viscosity calculation at an infinite shear rate. Thinning with 10% xylene did not affect workability. The influence of dilution on sagging is that modifies the shear stress and build up kinetics. The thinned samples with castor oil showed lower dry film thickness without sagging. (Edited author abstract) 10 refs.

del Amo, Beatriz (CIDEPI, La Plata, Argent); Rascio, Vicente J.D.; Guidice, Carlos A. *Key Eng Mat* v 20-28 pt 1-4 1988, 10th Int Congr on Met Corros, Madras, India, Nov 7-11 1987 pt 2, p 1063-1070.

**Viscosity** See Also ACRYLICS—Latex.

**075913 CONTROLLING VISCOSITY OF HIGH-SOLIDS COATINGS.** With the shift from solvent-based coatings to high-solids high-performance coatings, products finishers are facing many production problems that didn't exist five years ago. Driven by EPA requirements for the reduction of volatile organic compounds (VOCs), coating producers are introducing highly viscous finishes to manufacturers. Fluid heaters improve the application characteristics of high-solids coatings, resulting in higher quality finishes.

Soderstrom, Ric (Graco Inc, Minneapolis, MN, USA). *Prod Finish (Cincinnati)* v 52 n 7 Apr 1988 p 98-103.

## Weathering

**075914 ACCELERATED WEATHERING OF AUTOMOTIVE PAINTS MEASURED BY GLOSS AND INFRARED SPECTROSCOPY.** The purpose of this study was to determine how much faster automotive paints weathered by accelerated programs than by Florida exposure, and which accelerated program best simulated the effects of Florida exposure. Nine automotive paints, each in white and light blue colors, were weathered by five exposure programs. Three of these exposure programs used sunlight in Florida, Florida and Caracas, and in Arizona using EMMA (Equatorial Mount with Mirrors for Acceleration). The two other exposure programs used laboratory conditions and illumination (xenon-arc and quartz-filtered ultraviolet). The effect of surface weathering was measured by loss of gloss. Spearman ranking correlation coefficients of rates of gloss loss showed xenon-arc weathering correlated with Florida weathering slightly better than QUV, but both were greater than 0.9. (Edited author abstract) 23 refs.

**PAINT SPRAYING** See Also ELECTROPLATING SHOPS—Quality Control; ROBOTS, INDUSTRIAL—Manipulators.

**075915 NEW PRETREATMENT AND SPRAY PLANT FOR VAUXHALL'S CAVALIER.** A new pretreatment and spray painting plant built by Durr Ltd, Warwick, for finishing the saloon, hatch-back, and estate models of the popular Cavalier car, has been integrated into the production line at Vauxhall Motors Ltd's factory in Luton. Costing £20m, the Durr plant went into full production at the end of last year (1986). It is one of the most modern in Europe, and forms part of a new extension to the AC Block of Luton, which including the building and services represents a total investment by Vauxhall of £93m. Finishing capacity has increased from 40 to 52 bodies per hour. In addition to designing and manufacturing the finishing plant, Durr acted as consultants for the design of all the services in the AC Block extension.

Anon. *Prod Finish (London)* v 40 n 10 Oct 1987 p 15.

**075916 NEW STEELCASE HIGH-SOLIDS DISK LINE.** A new high-speed rotary disk line at Steelcase is improving quality, reducing operating costs, cutting energy use and minimizing the emission of volatile organic compounds (VOCs). The line was installed at the company's computer furniture plant in Grand Rapids, MI, to coat computer housings and lighting fixtures. Reduced operating costs stem from low manpower operating and maintenance requirements. One person operates the lines.

Anon. *Ind Finish (Wheaton Ill)* v 63 n 11 Nov 1987 p 37-38.

**075917 HON RECYCLES HIGH-SOLIDS OVER-SPRAY.** High solids solventborne coatings tend to be more costly than conventional low solids coatings. With this extra cost in mind, finishers applying high solids tend to be interested in transfer efficiency. Paint that doesn't reach the part to be coated becomes lost overspray. At the HON Co. plant in Cedartown, GA, the overspray is being recovered and recycled. The operation is allowing the plant to use nearly 95% of the paint that is sprayed.

Gardner, Charles L. (HON Co, Muscatine, IA, USA). *Ind Finish (Wheaton Ill)* v 63 n 12 Dec 1987 p 30-31.

**075918 EB/UV CURE OF 100%-SOLIDS 'WET-LOOK' PIGMENTED COATINGS.** High-gloss 'wet look' pigmented finishes have increased in popularity in various markets in the last few years. To meet consumer demand for durable high gloss products, technological advances were introduced during the 1970s which involved multiple applications, cures and sandings of ultraviolet-curable polyester resins. Universal Woods (Louisville, KY) has developed a UV and electron beam system for curing 100% solids pigmented coatings to

create high gloss finishes on flat stock for furniture and cabinet components. This process eliminates the shortcomings of the Italian method.

Anon. *Ind Finish (Wheaton Ill)* v 63 n 12 Dec 1987 p 34-35.

**075919 SOME RECENT ADVANCES IN AUTOMATIC SPRAY PAINTING SYSTEMS.** The article briefly reviews developments in automatic systems. Several installations in England are cited. The equipment includes horizontal traverse spraying machines, robots, camera recognition systems and two-component systems. 2 refs.

Eaton, Mike. *Prod Finish (London)* v 41 n 2 Feb 1988 p 10, 12-13.

**075920 PAINTING WITH A GENTLE TOUCH.** Low pressure high volume turbine spray equipment employs essentially an air turbine and a spray gun. The turbine generates atomizing air at a pressure of 7 to 10 psi at high-cfm volumes. The frictional action of the turbine's stages generates atomizing air at 200°F. The system can be used with specially designed manual or automatic guns. Robotic use also is possible.

Bunnell, Mike H. (CAN-AM Engineered Products Inc, Livonia, MI, USA). *Ind Finish (Wheaton Ill)* v 64 n 5 May 1988 p 28.

**075921 KOMATSU'S NEW PAINTING SYSTEM.** Large construction equipment is painted with an air-dry high-solids coating at Komatsu American Manufacturing Corp. in Chattanooga, Tennessee. Painters use air-assisted airless guns, both electrostatic and non-electrostatic. A trench in the spray booth permits spraying of the underside of the equipment.

Anon. *Prod Finish (Cincinnati)* v 52 n 9 Jun 1988 p 66-68.

## Automation

**075922 ENGINEERING DESIGN.** Today's high-performance military aircraft typically are built with bonded combinations of machined extruded aluminum sections, aluminum honeycomb, and aluminum skin. Pound for pound, the resulting structure is up to 39 times stronger than solid aluminum. Thermwood Corp. (Richardson, TX, and Dale, IN) has applied this same technology in the design of its new PR Series spray painting robots. Three different models are included in the line. All are six-axis units, incorporate the same basic construction details, and differ only in size and working envelope.

Stauffer, Robert N. (Robotics Today, Dearborn, MI, USA). *Rob Today* v 7 n 3 Jun 1985 p 75-76.

**075923 FINISHING THE JOB - AUTOMOTIVE-WISE.** Haden Drysys claims that keeping pace with the changing technology in paint finishing systems is something it has got down to a fine art. This is particularly so in the automotive industry where the company's continuous investment and research program has produced a range of new systems and equipment that solve the problems of air pollution, noise, energy conservation, corrosion and, increasingly have an emphasis on automation. (Author abstract)

Anon. *Prod Finish (London)* v 40 n 10 Oct 1987 p 12, 14.

**075924 CAD-BASED OFF-LINE PROGRAMMING OF PAINTING ROBOTS.** The progress of CAD/CAM methods and the growing interest in an off-line approach in robot programming supplied an idea for applying this technique to the programming of a painting robot. This would result in a better quality of coating and in a decrease of paint loss. There is also a possibility of interactive design of optimal spray gun trajectories for various workpieces. 7 refs.

Klein, Alexandr (Hungarian Acad of Science, Budapest, Hung). *Robotica* v 5 pt 4 Oct-Dec 1987 p 267-271.

## Control

**075925 CONTROLLING SPRAY BOOTHS WITH CHEMICALS.** Booth control chemicals have been developed primarily for treating unwanted overspray paint in both manual and automatic spray booths. They can be classified into two types. One type is chemicals for treating and neutralising the overspray paint to render it non-tacky and thus facilitate its eventual removal. These find their widest use in continuous, large volume production lines where a large amount of unwanted overspray paint is generated. The second type is temporary coatings which are applied to surfaces likely to be covered by the overspray paint and then subsequently removed. This type of booth control chemical would typically be used in intermittent production, manual spray booths or on exposed structural areas liable to contamination by the overspray paint.

**Efficiency** See Also PROTECTIVE COATINGS—Flame Spraying.

**075926 CALCULATING ON-LINE COATING TRANSFER EFFICIENCY.** The capability of coating application equipment to coat a product with a minimum of waste is a measure of its efficiency. Coating equipment transfer efficiency (CETE) can be evaluated on an operating chemical coating line with relatively good accuracy. The overall coating process efficiency (OCPE) is largely dependent on the CETE, and the difference between the two reflects losses in handling, spillage and clean-up. In the experiments reported, the paint material used was a two-coat, high-performance release coating.

## Equipment

**075927 SELECTING AUTOMATIC SPRAY GUNS.** Finishing plants relying solely on manual spray guns should investigate the possibility of switching to automatic guns. The upgrading can improve quality, reduce labor overhead, lower volatile organic compound (VOC) emissions, cut paint waste and lessen the likelihood of health and safety claims. Automatic (and manual) spray guns are of three basic atomizing types: air, airless and air-assisted airless. Each type is available with an electrostatic option.

Ehrenhofer, Kenneth R. (Kremlin Inc, Addison, IL, USA). *Ind Finish (Wheaton Ill)* v 63 n 11 Nov 1987 p 31-32, 34-35.

**075928 APPLYING HIGH-SOLIDS AND WATER-BORNE ELECTROSTATICALLY.** Several years ago the demand for the development of industrial coatings that would comply with pending environmental legislation led to interest in water-borne and high-solids coatings. It soon became apparent that in order to spray these coatings efficiently, some modifications to the application equipment would be required. High-speed rotational atomizers coupled with system modules and automatic control can apply hard-to-atomize coatings with high-quality results.

Scharfenberger, Jim (Ransburg-Gema Inc, Indianapolis, IN, USA). *Prod Finish (Cincinnati)* v 52 n 8 May 1988 p 50-55.

**075929 TODAY'S POWER-AND-FREE CONVEYORS.** Planners of finishing systems are continually searching for ways to increase finish quality, improve product

flow, reduce handling and lower costs. Many have discovered that an improved material handling system can help meet those goals. For applications in the finishing industry, a popular choice is the power-and-free conveyor. Today these conveyors are particularly valuable to highly automated painting facilities. The article discusses application to painting automobiles.

Tylaman, Theodore (Jervis B. Webb Co, Framington, MI, USA). *Prod Finish (Cincinnati)* v 52 n 11 Aug 1988 p 88-95.

**Fire Protection** See AUTOMOBILE MANUFACTURE—Painting.

**Optimization** See Also WOOD PRODUCTS—Finishing.

**075930 AIR-CLEANED FLAT-JET NOZZEL.** This paper is concerned with the problems of powder coating complex structural shapes using an automatic system. A short discussion of the physical principles involved demonstrates that the solution to these problems must be of both aerodynamic and electrical nature. A flat-jet nozzle with an air-cleaned electrode is proposed as a solution. The flat-jet nozzle produces the desired flow conditions and the air-cleaned electrode system supplies a consistent high-voltage charge. It is the combination of these two components that ensures both uniformity and consistency in powder coating the most difficult structures.

Welte, Urs J. (Ransburg-Gema Inc, St. Gallen, Switz). *Met Finish* v 86 n 8 Aug 1988 p 33-34, 36.

## Planning

**075931 PLANUNG UND REALISIERUNG NEUER LACKIERLINIEN FUER PULVERBESCHICHTUNG UND NASSLACK.** [Planning and Implementation of New Painting Lines for Powder Coating and Wet Paint]. This article presents a case from actual practice where the assets of powder coating are used as far as possible, although wet painting cannot be dispensed with. The problem solution, whose planning and implementation is described in detail, covers a total of three painting lines for powder and wet paint in combination. (Edited author abstract) In German.

Haupt, Helmut. *Metallberflaeche* v 41 n 9 Sep 1987 p 421-425.

**Robot Applications** See Also AUTOMOBILES—Painting.

**075932 AUTOMATIC PAINT PLANT SPEEDS PRODUCTION AND INCREASES FINISH QUALITY AT CROWN CONTROLS.** Crown Controls of Galway, Eire had several painting problems in the production of pallet fork trucks. The problems ranged from inconsistent coverage to excessive overspraying. An automatic robot paint shop was installed to alleviate the problems.

Anon. *Prod Finish (London)* v 40 n 11 Nov 1987 p 14, 16.

**075933 ROBOTIC SPRAY PAINTING OF AUTOMOTIVE PARTS.** Highly automated finishing systems and an unusual method of handling parts throughout the operation are used at Windsor plastics. Major industries served include business machines, consumer electronics, appliances and automotive. Windsor recently installed Wizard PartPainter Automation Cells for two of its spray painting stations. The Wizard robots are set up for high-volume parts.

Wesson, Jeffery. *Prod Finish (Cincinnati)* v 52 n 8 May 1988 p 58-64.

## Wastes

**075934 ABWASSEREINIGUNG - EIN BEITRAG ZUM UMWELTSCHUTZ.** [Wastewater Treatment - A Contribution to Environmental Protection]. Companies are under unmistakable pressure to deal more intensely

with the subject of wastewater engineering. This article focuses in particular on wastewater from painting shops and plants for its pretreatment. Readers are informed about practically oriented solutions, and consideration is given to dumping suitability. (Edited author abstract). In German.

Tschacher, Ulrich (Morgenstern Anlagen- und Maschinenbau GmbH). *Metallberflaeche* v 42 n 6 Jun 1988 p 297-298.

**PAINTING** See Also MOTOR TRUCKS—Painting; ORGANIC COMPOUNDS—Recovery; SOLVENTS—Applications; STEEL—Finishing; STEEL SHEET—Protective Coatings.

**075935 PULVERLACKERING - TEKNIK OCH ARBETSMILJO.** [Powder Coating - Technology and Work Environment]. This report is intended for people who participate in the choice of painting methods. The intention is to provide information about powder coating in such a way that the reader can decide whether it is a method that is suitable for the type of production concerned. The most usual method of applying powder to the object concerned is by spraying, but fluidized bed coating is also utilized. There are two different principles whereby each grain of powder is given a charge: through ionization or through friction. Conventional electrostatic charging, also known as corona charging, is based on the principle of ionization. (Edited author abstract) In Swedish. 67 refs.

Klinton-Kamark, Birgitta. *Inst Verkstadstek Forsk IVF Resultat* 86502 Apr 1986 66p.

**075936 THIRTY PATHS TO A PAINTED FINISH.** Advanced Machine Co. needed a conveyor system to move parts through its various painting and powder coating operations. When the Plymouth, Minnesota manufacturer of floor care and cleaning machines built a new facility to house its painting system, the selection of the right conveyor system was a high-priority item. The article describes the overhead power and free conveyor chosen.

Anon. *Prod Finish (Cincinnati)* v 52 n 6 Mar 1988 p 116-117.

**075937 PAINT BOOTH VOC EMISSION REDUCTION THROUGH AIR RECIRCULATION.** The continued reduction in allowable volatile organic compound (VOC) emissions embodied in the Clean Air Act has required operators of paint shops to search for new methods to limit VOC emissions from their finishing processes. One available method to reduce the exhaust volumes from paint spray booths while increasing the concentration of VOCs in the exhaust stream is air recirculation. This involves recirculating most of the exhaust air back to the booth with only a small stream being drawn off so as to keep the solvent concentration in the recirculating stream at any desired level. This article covers design, capital investment and operating costs.

Bhushan, Dinesh (Durr Industries Inc, Plymouth, MI, USA). *Met Finish* v 86 n 5 May 1988 p 51-55.

**075938 JIT DELIVERY HELPS PLASTICS FINISHER.** Just-in-time delivery of paint is bringing a number of advantages to a North Carolina molder and finisher of structural foam and other plastic products. The company is the Cashiers Structural Foam Div. of Consolidated Metco Inc. (Cashiers, NC). Under the principles of just-in-time (JIT) delivery, most paint is brought to the plant as it is needed. This has allowed Cashiers to free up most of the former paint storage area in the 10,000-sq-ft plant.

Anon. *Ind Finish (Wheaton Ill)* v 64 n 6 Jun 1988 p 33.

## Automation

**075939 CUSTOM COATER INSTALLS AUTODEPOSITION LINE.** A Detroit company has become the first custom coating plant to install an autodeposition painting system. Autodeposition deposits a low-gloss black coating on a ferris substrate by means of a

dipping process (without the use of electricity). The coating is deposited through autophoretic chemical reaction in a waterborne bath that contains only about 5% solids. The bath generates no volatile organic compounds. The company is Crown Enameling Products Inc. of Warren, MI. The autodeposition line is coating suspension leaf springs for General Motors pickup trucks.

Schranz, Joe (Industrial Finishing, Wheaton, IL, USA). *Ind Finish (Wheaton Ill)* v 64 n 3 Mar 1988 p 32-34, 55.

## Computer Applications

**075940 TOTALLY INTEGRATED PAINT FACILITY TO DEBUT.** Navistar International (Chicago), formerly International Harvester, is a leader in the manufacture of medium and heavy trucks. In 1985, Navistar began building a 210,000 ft<sup>2</sup> (19 510 m<sup>2</sup>) facility specifically for paint application. Giffels Associates, Inc. (Southfield, MI), designer of the facility, also developed the functional specifications for all its process systems and the Facility Computer Monitoring System (FCMS) to integrate the process systems. The facility will house pretreatment and electrodeposited prime paint lines, sealing robots, ovens, paint skids and transport system, paint booths, and painting robots. Thermal oxidizers to reduce volatile organic compound (VOC) emissions, vision inspection systems, and the FCMS will also be housed there. Author describes the design considerations, system operation, system hierarchy and system integration of the totally integrated paint facility.

Wilson, Donald. *CIM Technol* v 5 n 4 Winter 1986 p 86-88.

**Control Systems** See AUTOMOBILE MANUFACTURE—Painting; AUTOMOBILES—Painting.

## Electrodeposition

**075941 ELECTROCOATING IN THE APPLIANCE INDUSTRY.** Electrocoating has played a major role in the appliance industry. The first application of anodic electrocoating occurred in 1968 at the Clyde Division of the Whirlpool Corp. This process replaced a flow coat operation and featured significant improvements in corrosion resistance due to edge and hole coverage, which could not be effectively achieved with flow coating. Anodic electrocoating tends to dissolve the metal preparation, leading to corrosion as water diffuses into the coating. Cathodic electrocoating became an answer looking for a question and found its feasibility proof in coating air conditioner compressors in 1970. This was followed by the installation of a 42,000 gal tank to coat air conditioner cabinets; replacing a two-coat system with a highly automated process. After proving its potential in appliances, the automotive industry adopted the process with equal success. Today, cationic electrocoating points the way for the successful application of porcelain replacement coatings and high performance single coat top coats. This paper traces the development of cationic electrocoating and its impact on the coatings industry. (Author abstract) 5 refs.

**Monitoring** See BRIDGES, STEEL—Painting.

**Research** See AUTOMOBILES—Painting.

**Robot Applications** See Also MOTOR TRUCKS—Cabs.

**075942 ROBOTS APPLY TEXTURE COAT TO COMPUTER HOUSINGS.** Robotic spray is improving the quality of a texture topcoat applied at Fame Plastics (Cummings, GA). The coating is for injection-molded glass-filled polycarbonate computer housings for IBM. The consistency of spray ensures repeatable conformance to finishing specifications set by IBM. This minimizes rejects, increases productivity and cuts paint consumption.

Anon. *Ind Finish (Wheaton Ill)* v 64 n 6 Jun 1988 p 34.

## PALLADIUM ALUMINUM ALLOYS

## Internal Oxidation

**075943 MODULATING THE COMPOSITION OF A METAL/OXIDE INTERFACE AND USING HYDROGEN AS A PROBE.** Strong irreversible traps for hydrogen atoms in internally oxidized Pd-3 at.% Al alloys are related to segregation at the Pd/Al<sub>2</sub>O<sub>3</sub> phase boundaries. From an estimation of the strength of the binding energy, simple thermodynamic considerations, and sample preparation in an oxygen excess environment it is concluded that unsaturated oxygen bond are present at the phase boundary and that the trapping corresponds to the formation of O-H bonds. For the case of Al-excess, oxygen bond should be all saturated and Al-bonds remain unsaturated where no strong trapping of hydrogen is expected in agreement with experiment. The case of free oxygen bonds at the interface and the irreversible trapping of hydrogen could be regained by annealing in air. Thus, hydrogen provides evidence that the composition of a phase boundary can be modulated depending on the chemical potentials of the species forming the compound. 13 Refs.

## PALLADIUM AND ALLOYS See Also PALLADIUM COMPOUNDS—Stability.

**075944 DIFFUSIVITY OF HYDROGEN IN PALLADIUM-BASED SOLID SOLUTIONS.** An electrolytic method has been used to measure the temperature variation of the diffusivity of hydrogen in Pd-based substitutional solid solutions in the temperature range 270-350 K. The substitutional solutes were Fe, Co, Mn, Cr, and Ni. The kinetic data obtained for these systems, and previous data for systems containing the noble metals, transition metals of the First Long Period, and the Group V metals as substitutional solutes, have been analyzed in terms of equations derived by applying absolute rate theory to the cell model for ternary solid solutions. The analysis shows that the substitutional solute atoms create trapping sites for hydrogen atoms which are relatively shallow (0.4 kJ/mole) in comparison with sites created by the cold deformation of pure palladium (approx. 20–40 kJ/mole). The noble metals create the shallowest trapping sites for hydrogen and the Group V metals the deepest. (Author abstract) 34 refs.

## Adsorption See CATALYSTS—Palladium.

## Amorphous

**075945 LOW-ENERGY EXCITATIONS AND THEIR ORIGIN IN AMORPHOUS METALS.** The phonon thermal conductivity  $\kappa^{\text{ph}}(T)$  at low temperatures is measured on a series of amorphous Pd-Cu-Si based alloys. In detail, the changes of the phonon scattering by low-energy excitations (LEE) at temperatures 0.3 K < T < 1 K are systematically investigated, when the glass temperature  $T_g$  and the amount of frozen-in free volume  $v_f$  is altered by different methods. On the basis of calculations of the free volume it will be shown that the density of LEE as inferred from the  $\kappa^{\text{ph}}(T)$  measurements correlates strongly with the amount of free volume. In contrast to the irreversible changes in  $\kappa^{\text{ph}}$  observed upon annealing the samples, also reversible changes occur which are attributed to effects in chemical short range ordering in the Pd-Cu-Si glasses. (Edited author abstract) 35 refs.

## Coatings

**075946 EFFECT OF JOULE HEATING IN ELECTROCHEMICAL MEASUREMENT OF HYDROGEN TRANSPORT.** It has been shown that Joule heating during electrochemical charging at high current densities can produce substantial heating of the specimen and results in an increase in measured anodic current. Localized electrolyte heating and specimen temperature rise is a function of cell geometry and electrolyte circulation. The anodic current increase due to heating depends on the anodic current before charging and the palladium coating used. The steady state corrosion current depends on the strain rate and the method of deposition of the palladium coating on the anodic side. Finally, the present work and that of O-I demonstrate clearly that the increase in anodic current observed immediately after electrochemical charging during plastic deformation in nickel is due to Joule heating of the specimen and not dislocation transport of hydrogen. 7 refs.

**075947 AUGER ELECTRON SPECTROSCOPY AND ELECTROCHEMICAL CHARACTERIZATION OF Au-Pd SYSTEM IN 1 M H<sub>2</sub>SO<sub>4</sub>.** The electrochemical characterization of the Au-Pd system has been carried out by measuring the oxygen electroadsorption properties of palladium surfaces coated with gold (vacuum deposited) in 1 M H<sub>2</sub>SO<sub>4</sub> at 25°C. These properties are shown to be different from those of Pd-Au alloy. A prolonged repetitive triangular potential sweep was used to induce changes in surface composition which were followed by Auger electron spectroscopy. The crater edge profiles are consistent with the information obtained in the standard depth profile, showing an interface a few angstroms thick very close to the surface. This layer is enriched in palladium. Between this interface and the bulk of the electrode, gold is predominant, but with a considerable amount of palladium forming a mixture with the gold. (Author abstract) 20 refs.

## Defects

**075948 INTERACTION OF HYDROGEN WITH DISLOCATIONS IN PALLADIUM - I. ACTIVITY AND DIFFUSIVITY AND THEIR PHENOMENOLOGICAL INTERPRETATION.** Activity and diffusivity of hydrogen in deformed and annealed palladium has been measured by an electrochemical technique for different degrees of deformation (73, 50, 15, and 6%), at 295 and 322 K and over a wide range of hydrogen concentration from about 1 to 10<sup>4</sup> at.ppm. Deviations from the ideal solution behavior are drastic at the low concentration side where the solubility enhancement is as high as 1.2 · 10<sup>6</sup> for 73% deformation and 1 at.ppm. The diffusivity decreases with decreasing hydrogen concentration but at very low concentrations of some at.ppm an enhancement of the diffusion is observed. Evidence for this transport mechanism is also given by an unusual diffusion behavior during current pulse measurements at low concentrations. At 295 K the dislocation pipe diffusivity is about ten times as much as the bulk value in annealed samples. (Edited author abstract) 21 refs.

Kirchheim, R. (Max-Planck-Inst fuer Metallforschung, Stuttgart, West Ger). *Perspect in Hydrogen in Met, Collect Pap on the Eff of Hydrogen on the Prop of Met and Alloys* Publ by Pergamon Press, Oxford, Engl and New York, NY, USA, 1986 p 355-363.

**075949 INTERACTION OF HYDROGEN WITH DISLOCATIONS IN PALLADIUM - II. INTERPRETATION OF ACTIVITY RESULTS BY A FERMIDIRAC DISTRIBUTION.** Measurements of the activity of hydrogen in deformed palladium have revealed

a strong interaction with dislocations. The 'Fermi energy of hydrogen' is equal to the interaction energy and contains a contribution of -18 kJ/mole H which was attributed to the formation of a hydride close to the dislocation core. The elastic contribution was calculated from the stress field of an edge dislocation and its dependence on the reciprocal distance from the dislocation core corresponds to a dependence on the reciprocal square root of concentration in agreement with experimental findings. Deviations from this behavior at small distances were explained by a failure of the continuum mechanical calculations of the stress field yielding a cut-off radius of one Burgers vector. (Edited author abstract) 25 refs.

Kirchheim, R. (Max-Planck-Inst fuer Metallforschung, Stuttgart, West Ger). *Perspect in Hydrogen in Met, Collect Pap on the Eff of Hydrogen on the Prop of Met and Alloys* Publ by Pergamon Press, Oxford, Engl and New York, NY, USA, 1986 p 365-373.

## Electric Conductivity

**075950 HIGH-PURITY PALLADIUM SINGLE-CRYSTAL ELECTRICAL RESISTANCE MEASUREMENTS AT HIGH TEMPERATURE.** Measurements of the electrical resistance of an ultra-high-purity single crystal of palladium have been made to a temperature within 100°C of the melting point. These are reported along with measurements of the molten palladium resistivity. The results are discussed and compared with previously reported values. (Author abstract) 7 refs.

## Extraction

**075953 CATALYTIC EFFECT OF QUATERNARY AMMONIUM SALT ON THE EXTRACTION OF PALLADIUM(II) WITH 2-HYDROXY-5-NONYLBENZOPHENONE OXIME (LIX 65N) IN HEPTANE-CHLOROFORM SOLVENTS.** Extraction of Pd(II) from acidic chloride media using 2-hydroxy-5-nonyl-benzophenone oxime (LIX 65N, HL) in heptane is 60% more rapid than that using chloroform under comparable conditions, as well as more complete, reflecting an eight-fold increase in the extraction constant. A further substantial increase in the extraction rate was achieved using the quaternary ammonium salt, Aliquat 336S, without any change in the extraction constant. The extraction probably occurs through rapid phase transfer of  $\text{PdCl}_4^{2-}$  via ion pair extraction followed by formation of the chelate,  $\text{PdL}_2$ , in the organic phase. (Author abstract) 7 refs.

Rong, Qingxin (Univ of Arizona, Tucson, AZ, USA); Freiser, H. *Solvent Extr Ion Exch* v 5 n 5 1987 p 923-937.

## Gas Alloying

**075954 EFFECT OF TRAPPING ON THE SOLUBILITY AND DIFFUSIVITY OF HYDROGEN IN PALLADIUM ( $\alpha$ -PHASE).** The solubility and diffusivity data of hydrogen in palladium with different concentrations of defects are discussed within the framework of the two-level model with local equilibrium (Oriani's model). Analytical expression of the solubility isotherm and of the variation of the apparent diffusion coefficient depending on the total bulk concentration are derived. A good agreement is found between the experimental results on the solubility and diffusivity of hydrogen and the calculated values using the theoretical expressions. (Author abstract) 19 refs.

Bucur, R.V. (Inst of Isotopic & Molecular Technology, Cluj-Napoca, Rom). *J Mater Sci* v 22 n 9 Sep 1987 p 3402-3406.

## Gases

**075955 STRESS AND SOLUBILITY FOR SOLUTES WITH ASYMMETRICAL DISTORTION FIELDS.** The influence of stress on chemical potential and solubility for solutes with asymmetrical distortion fields is considered. Numerical solutions and series approximations are presented for several examples of different stress states. Both open and closed thermodynamic systems are treated. The calculations are compared with results for hydrogen in crystalline Pd and amorphous Pd alloys. The latter involves an asymmetrical distortion field. (Author abstract) 10 refs.

Kirchheim, R. (Max-Planck-Inst fuer Metallforschung, Stuttgart, West Ger); Hirth, J.P. *Acta Metall* v 35 n 12 Dec 1987 p 2899-2903.

**075956 INFLUENCE OF SURFACE IMPURITIES ON HYDROGEN PERMEATION THROUGH PALLADIUM.** In order to improve the understanding of the hydrogen-metal interaction, we have studied the influence of the surface state of a thin film of palladium on the hydrogen permeation process. Energetic desorption values  $E_d$  have been calculated by thermal programmed desorption experiments for various pretreatments of the sample. Auger spectral analysis shows that carbon, sulphur and oxygen are present at the surface of the metal. Results allow us to conclude that the increase in  $E_d$  is certainly connected with an increase in concentration of sulphur at the surface. (Author abstract) 18 refs.

Lalauze, R. (Ecole Natl Supérieure des Mines de Saint-Etienne, Saint-Etienne, Fr); Gillard, P.; Pijolat, C. *J Less Common Met* v 138 n 2 Mar 15 1988 p 179-187.

## Heat Treatment

**075957 BLOCKING OF HYDROGEN-DISLOCATION INTERACTIONS IN PALLADIUM BY INTERSTITIAL CARBON (BORON) SOLUTES.** It has

been shown that the segregation of hydrogen to dislocations at 323 K decreases in palladium doped with interstitial carbon or boron after a relatively low temperature annealing, at 423 K. After a similar treatment, pure palladium continues to show a large segregation of hydrogen to dislocations. TEM studies have shown that the dislocation densities are large in both the pure palladium and the carbon doped samples after annealing at 423 K. These results are consistent with the explanation that the heavy interstitial atoms, carbon or boron, migrate to dislocations at 423 K and block these dislocations for occupation by hydrogen. (Author abstract). 16 refs.

Leaching See PLATINUM AND ALLOYS—Leaching.

## Low Temperature Properties

**075958 CRYSTAL STRUCTURES OF H-Pd<sub>5</sub>Ce AND Pd<sub>5</sub>La AND THEIR ELECTRICAL RESISTIVITIES AT LOW TEMPERATURES.** The crystal structure of Pd<sub>5</sub>La was analyzed by powder X-ray diffraction and electron microscopy, and it was found that Pd<sub>5</sub>La is almost isomorphous with H-Pd<sub>5</sub>Ce. The electrical resistivity was examined for Pd<sub>5</sub>La, H-Pd<sub>5</sub>Ce and L-Pd<sub>5</sub>Ce in the range between 77 K and 300 K. The temperature dependence of resistivity suggested that H-Pd<sub>5</sub>Ce and L-Pd<sub>5</sub>Ce have a dense Kondo state. (Author abstract) 5 refs.

Itakura, Masaru (Kyushu Univ, Kasuga, Jpn); Hisatsune, Yoshimi; Sato, Hiroshi; Kuwano, Noriyuki; Oki, Kensuke. *Jpn J Appl Phys Part 1* v 27 n 4 Apr 1988 p 684-685.

## Magnetic Properties

**075959 COMPARISON BETWEEN THE MAGNETIC SUSCEPTIBILITIES OF Pd<sub>1-x</sub>Ag AND SINGLE PHASE PdH<sub>x</sub>.** The rapid decrease of the isothermal magnetic susceptibility  $\chi$  of single phase PdH<sub>x</sub> with n (=atomic ratio H/Pd) above the critical temperature  $T_c = 564$  K differs from that of the magnetically similar single phase system Pd<sub>1-x</sub>Ag<sub>x</sub> ( $x$ : silver mole fraction) at the same temperature and at equal valence electron concentrations ( $n=x$ ), i.e.  $\chi(\text{PdH}_n) - \chi(\text{Pd}_{1-x}\text{Ag}_x) > 0$ . By use of a semiphenomenological susceptibility ansatz related to the nonideal solution behavior of H (AG) in Pd the susceptibility difference is interpreted as an electronic excess effect. The analysis of the steep descent of the magnetic susceptibility also applies to the Pd-rich side of Pd in the subcritical temperature region (so-called  $\alpha$ -phase) and can be supported by  $^1\text{U}$   $^{57}\text{Pd}$  Knight shift data at 348 K. (Author abstract) 19 refs.

## Microstructure

**075960 SYSTEMATISCHE METALLOGRAPHISCHE PRAEPARATION ZUR GEFUEGEINTERPRETATION MEHRKOMPONENTIGER PALLADIUM-SYSTEME.** [Systematic Metallographic Preparation for the Structural Interpretation of Multicomponent Palladium Systems.]. Noble metal alloys, especially Pd-based alloys with Sn, In and Ga additions are prominent in dental technology as well as in the chemical industry and jewelry. Knowledge of the relevant phase diagrams and the phases concerned is therefore crucial. Several polishing and etching techniques are involved in the preparation side of this constitutional work for metallographic analysis. Using the revised systems Pd-Ga and Pd-In as examples, the preparation of various alloys is described. The applied metallographic techniques of etch polishing and electro-swab polishing enable a concentration-dependent systematic approach to the preparation to be developed. This is applicable to both higher-component Pd noble metal alloys and Pd nonprecious metal alloys. 12 Refs.

Schmid, Eberhard E. (Max-Planck-Inst fuer Metallforschung, Stuttgart, West Ger); Carle, Veronika. *Prakt Metallogr* v 25 n 7 Jul 1988 p 340-348.

## Phase Diagrams

**075961 EFFECT OF LATTICE DISTORTIONS ON THE X-RAY MEASUREMENT OF LATTICE PARAMETERS FOR PdH<sub>x</sub>. I. EMPIRICAL RELATIONSHIPS.** Measurements have been made of the changes in x-ray lattice parameter which result when a PdH<sub>x</sub> alloy is taken on a path in the PdH<sub>x</sub> phase diagram which traverses the mixed ( $\alpha + \beta$ )-phase region to reach  $\beta$ -phase concentrations ( $0.70 < x < 0.92$ ). The changes were followed by comparing the lattice parameter values for alloys which had been taken along such a path with lattice parameter values of alloys taken along paths avoiding the mixed-phase region in reaching  $\beta$ -phase concentrations of comparable value. From previous experience with the mixed ( $\alpha + \beta$ )-phase region and the observed diffraction line broadening and magnitude and direction of the lattice parameter shifts, it can be inferred that the lattice parameter changes are due to internal stresses resulting from the progression of the  $\alpha \rightarrow \beta$  phase changes as the alloy is moved through the mixed-phase region. A discussion is given of some implications of these observations for the use of lattice parameter measurements in locating coexisting curves for M-H alloys. (Author abstract) 20 refs.

## Physical Properties

**075962 SPIN-RESOLVED PHOTOEMISSION FROM Pd(111).** Circularly polarized synchrotron radiation of BESSY and spin-resolved photoemission have been used for a study of the electronic structure of Pd in  $\Lambda$ -direction. The photon energies were chosen between the photoemission threshold at 5.7 and 23 eV. We used the highly symmetric experimental setup of normal light incidence and normal photoelectron emission and studied transitions from the two  $\Lambda_6^{3/2}/\Lambda_4^{5/2}$ -band-pairs split by spin-orbit interaction. Though the magnitude of the spin-orbit splittings  $\Delta E_{so}$  in this medium-Z material is smaller than lifetime broadening, it is feasible to resolve the spin-orbit splitting of the initial states via photoelectron spin analysis. The data are consistent with a band-structure calculation of Noffke and Eckardt except for an energy dependent shift of 0.4 to 1.1 eV of the final bands towards higher energies. In the occupied part of the bandstructure an avoided crossing could be identified. Surface- (bandgap)- emission was observed for photon energies below 7.8 eV. (Author abstract) 19 refs.

## Radiation Effects

**075963 RADIATION CHARACTERISTICS OF PALLADIUM EXTRACTED FROM SPENT FUEL OF THE BOR-60 REACTOR.** Palladium is extensively used in various industrial fields. Its natural abundance is low, but it is produced as a fission product in the burnout of nuclear power-plant fuel; its buildup depends on the type of fuel, operating periods, and cooling time after irradiation. In water-cooled water-moderated reactors the buildup is 1 kg of palladium per ton of fuel, and in fast-neutron reactors it is 5 kg. It is therefore worth considering the possibility of utilizing the raffinates from the reprocessing of spent fuel to extract palladium and put it to further use. The object of this study was to experimentally determine the content of  $^{107}\text{Pd}$  in purified palladium extracted from fast-reactor fuel, and to ascertain its radiation characteristics. 8 refs.

## Spectroscopic Analysis

**075964 EXTRACTION-ATOMIC ABSORPTION SPECTROPHOTOMETRIC DETERMINATION OF PALLADIUM AS ITS ANIONIC COMPLEX WITH A SULFONATED AZO DYE.** The use of 3-hydroxy-4-(1H-tetrazol-5-ylazo)-2,7-naphthalenedisulfonic acid (T-azo-R) as a complexing agent for the separation of palladium from rhodium, platinum, or iridium by solvent extraction in the presence of benzalkonium chloride (BACl) has been investigated. After reextraction with perchloric acid from organic to aqueous phase, palladium can be determined by air-acetylene flame atomic absorption spectrometry (FAAS), by means of a calibration curve prepared with commercial standard solutions. The method has been applied to the determination of palladium and rhodium content in two pharmaceutical processing sludges. (Edited author abstract) 14 refs.

Pesavento, Maria (Univ di Pavia, Pavia, Italy); Riolo, Carla; Achilli, Marco. *Anal Chem* v 60 n 4 Feb 1988 p 332-335.

**075965 STUDIES ON HIGHLY SENSITIVE COLOUR REACTION IN THE SYSTEM OF PALLADIUM(II)-TIN(II) CHLORIDE-CRYSTAL VIOLET IN THE PRESENCE OF POLYVINYL ALCOHOL.** A sensitive spectrophotometric method for determination of palladium has been developed. The effect of light for improvement of the reproducibility of the determination and the optimum conditions for formation of the ion associate have been investigated. The molar absorptivity is  $3.7 \times 10^4 \text{ l-mol}^{-1} \text{ cm}^{-1}$  at 550nm. Beer's law is obeyed for 0.1–1.0  $\mu\text{g}/25\text{cm}^3$  of palladium. The method was used for the determination of palladium in some precious metal samples. (Edited author abstract). 8 Refs. In Chinese.

**075966 XPS SURFACE AND BULK STUDIES OF HEAT TREATED PALLADIUM IN THE PRESENCE OF HYDROGEN AT 150°C.** Palladium metal powders used for hydrogen isotope pumping were studied for their bulk and surface chemistry changes during cleaning with hydrogen gas at 150°C. Cleaning is necessary to promote rapid hydriding and dehydriding and to prevent contaminant ingrowth in the process gas during use. These studies show that heating the powders in vacuum at moderate temperatures (150°C) in a reducing environment removes surface oxide, leaves a predominately palladium metal surface which presents no significant barrier to hydrogen absorption or desorption, and shows no loss in surface area and pourability. A surface model of PdO is given and XPS results show that the water-forming reaction is the mode of PdO reduction. Thermodynamic data are discussed which support the above results. (Author abstract) 37 refs.

## Structure

**075967 ELECTRONIC STRUCTURE OF PALLADIUM-NOBLE METAL ALLOYS.** The authors perform a comparative study of the electronic structure of palladium-noble metal alloys  $\text{Cu}_x\text{Pd}_{1-x}$ ,  $\text{Ag}_x\text{Pd}_{1-x}$ , and  $\text{Au}_x\text{Pd}_{1-x}$ . They demonstrate different behaviour of Pd impurities in noble metal alloys and the reliability of their choice of alloy potentials, allowing for a consistent treatment of charge self consistency and lattice relaxations. The method is thus superior to other methods.

Surface Properties See HYDROGEN—Adsorption.

Surfaces See METHANOL—Adsorption.

## Thermodynamic Properties

**075968 THERMODYNAMIC FUNCTIONS IN DILUTE Pd-H SOLID SOLUTIONS.** Authors have demonstrated that virtually all of the variation with temperature of excess entropy and partial molar enthalpy for H in dilute Pd-H solutions arise from the 'oscillator' term and contributions from anharmonicity, the temperature dependence of the local mode frequencies, or the 'electronic' term may be ignored. 20 refs.

## Thermodynamics

**075969 SOLID SOLUTIONS OF Pd CONTAINING HYDROGEN AND A NOBLE METAL SUBSTITUTIONAL COMPONENT - I. THERMODYNAMIC BEHAVIOR.** Elastic data have been measured for Pb-based solid solutions containing Cu, Au, and Ag in the concentration range 0-50 at.% of substitutional solute and in the temperature range 300-1200 K. The elastic data have been used to evaluate a statistical mechanical model for solid solutions of hydrogen in Pb-based solutions containing noble metals. The elastic data are used to calculate that contribution to the partial thermodynamic functions of the dissolved interstitial atoms which arises due to the change in the specific volume of the metal lattice as the substitutional atom concentration is varied. (Author abstract) 8 refs.

Yoshihara, M. (Rice Univ, Houston, TX, USA); McLellan, R.B. *Perspect in Hydrogen in Met, Collect Pap on the Eff of Hydrogen on the Prop of Met and Alloys* Publ by Pergamon Press, Oxford, Engl and New York, NY, USA, 1986 p 3-8.

Thin Films See Also ACETYLENE—Hydrogenation; OLEFINS—Hydrogenation.

**075970 EFFECT OF HEAT TREATMENT OF Pd THIN FILM ALLOY ON HYDROGENATION OF CYCLOPENTADIENE.** The selectivity of the partial hydrogenation of cyclopentadiene was remarkably enhanced by heat treatment over Pd thin films containing boron or phosphorus at high content. This enhancement could be explained in terms of the small ensemble size and the low electron density of Pd. (Edited author abstract) 7 refs.

Tamaki, Jun (Osaka Univ, Toyonaka, Jpn); Yamamura, Masashi; Imanaka, Toshinobu. *Chem Express* v 2 n 10 Oct 1987 p 639-642.

**075971 THIN PALLADIUM FILMS PREPARED BY METAL-ORGANIC PLASMA-ENHANCED CHEMICAL VAPOUR DEPOSITION.** A method for the deposition of palladium films using the allylcyclopentadienyl palladium complex is reported. In a plasma-enhanced chemical vapor deposition process bright metallic films can be produced at low temperatures. The resistivity of these films approaches that of bulk palladium. If oxygen is used as the carrier gas, the films consist of PdO. (Author abstract) 14 refs.

Feurer, E. (Univ of Tuebingen, Tuebingen, West Ger); Suhr, H. *Thin Solid Films* v 157 n 1 Feb 15 1988 p 81-86.

**075972 OBSERVATION OF PERIODIC STRESS PRODUCED BY ION DAMAGE IN THIN FILMS.** The formation of periodic micro-crinkling, which exhibits a 'corduroy' contrast, has been observed in thin films of Pd and Ni after in situ implantation of B, Si, P and Ne at high doses ( $10^{16}$  to  $2 \times 10^{17}$  ions  $\text{cm}^{-2}$ ). This is associated with a macroscopic deformation of the thin film, apparently in the form of periodic bending. This effect increases

with increasing dose, until the thin film tears. (Author abstract). 27 Refs.

Ruault, M.O. (Cent de Spectrometrie Nucleaire et Spectrometrie de Masse, Orsay, Fr); Schack, M.; Bernas, H.; Chevalier, J.P. *Philos Mag A* v 58 n 2 Aug 1988 p 397-408.

**075973 INVESTIGATION OF D.C. PLANAR-MAGNETRON-SPUTTERED PALLADIUM FILMS BY SPECTROSCOPIC ELLIPSPOMETRY.** The pseudodielectric function of palladium films prepared by dc planar magnetron sputtering was measured by spectroscopic ellipsometry as a function of substrate temperature. The film data are in excellent agreement with an optical model using the Sen, Scala and Cohen effective medium theory, which is based on a dielectric coated-particle microstructure. With increasing substrate temperature, the palladium volume fraction was found to decrease slightly, while the r.m.s. microroughness of the film surface increased in magnitude. For temperatures below 115°C the film microstructure was not significantly affected by the substrate temperature but, by 190°C, the r.m.s. microroughness was  $80 \pm 3 \text{ Å}$ , with the palladium volume fraction in the bulk region falling slightly to  $97\% \pm 1\%$  relative to the film deposited at 22°C. These results are compared with those obtained by electron microscopy and x-ray diffraction. (Author abstract) 16 refs.

Sullivan, Brian T. (Univ of British Columbia, Vancouver, BC, Can); Parsons, R.R. *Thin Solid Films* v 154 n 1-2 Nov 12 1987, Pap Presented at the Int Conf on Metall Coat - Part II, San Diego, CA, USA, Mar 23-27 1987 p 281-289.

## Transport Properties

**075974 MACROCYCLE-MEDIATED TRANSPORT IN A BULK 1.5 M  $\text{HNO}_3$ - $\text{CHCl}_3$ -0.01 M  $\text{HNO}_3$  MEMBRANE SYSTEM OF  $\text{Pd}^{2+}$  AND  $\text{M}^{n+}$  FROM  $\text{Pd}^{2+}$ - $\text{M}^{n+}$  MIXTURES.**  $\text{Pd}^{2+}$  has been transported using sulfur substituted macrocycles as carriers and several  $\text{M}^{n+}$  ( $\text{M}^{n+} = \text{Li}^+, \text{Na}^+, \text{K}^+, \text{Rb}^+, \text{Cs}^+, \text{Mg}^{2+}, \text{Ca}^{2+}, \text{Sr}^{2+}, \text{Ba}^{2+}, \text{Ag}^+, \text{Ti}^+, \text{Cd}^{2+}$ , and  $\text{Pb}^{2+}$ ) have been transported using 18-crown-6 (18C6) and sulfur substituted macrocycles as carriers in a 1.5M  $\text{HNO}_3/\text{CHCl}_3/0.01\text{M HNO}_3$  bulk liquid membrane system. Competitive  $\text{Pd}^{2+}$ - $\text{M}^{n+}$  transport studies have also been carried out for the same systems. The cyclic polyether 18C6 transports  $\text{M}^{n+}$  selectively over  $\text{Pd}^{2+}$  for all  $\text{M}^{n+}$  except  $\text{Li}^+$ ,  $\text{Mg}^{2+}$ , and  $\text{Cd}^{2+}$ . In the cases of these three cations, no transport was found for either  $\text{Pd}^{2+}$  or  $\text{M}^{n+}$ . Generally, the sulfur substituted macrocycles transport  $\text{Pd}^{2+}$  selectively over  $\text{M}^{n+}$ . (Author abstract) 31 refs.

## Vapor Deposition

**075975 EFFECT OF MICA SURFACE 'DEHYDROXYLATION' ON PARTICULATE PALLADIUM VAPOR DEPOSITS.** Electron energy loss spectroscopy (ELS) and palladium nucleation were used to study the influence of pre- and post-cleavage annealing on some surface properties of muscovite mica. Two ELS features at 28 eV and 16 eV indicate OH molecules on the mica surface and in the near-surface bulk respectively. On post-cleavage heating of the mica to temperatures above 400°C the two surface losses disappear, causing the simultaneous liberation of water, which is explained by a dehydration of the  $\text{AlO}(\text{OH})$  layer of the mica lattice. The palladium nucleation and growth behavior is strongly influenced by the state of 'dehydration' of the mica surface. On 'dehydroxylated' mica the particle number density of palladium is increased and the mean particle size decreased owing in principle to stronger interaction between the mica substrate and the palladium deposit. (Author abstract)

## PALLADIUM BORON ALLOYS

### Molten

**075976 VAPORIZATION THERMODYNAMICS OF Pd-B(LIQUID) AND Pd-B-C(LIQUID).** The Pd-B and Pd-B-C liquid phases were studied by the Knudsen effusion technique to determine the variation of palladium and boron activity with composition and temperature. Equations are given which describe the thermodynamic properties throughout the liquid phase region. In addition, the phase boundary composition was determined between the liquid and the respective multiphase containing excess boron. The phase forms solid boron at 1600 K when the composition reaches  $Pd_{0.55}B_{0.45}$  and the palladium activity is 0.0186. Dissolved carbon causes the palladium activity to increase and the phase boundary to shift to a higher boron composition. (Author abstract) 7 refs.

## PALLADIUM CERIUM ALLOYS

### Amorphous

**075977 EVIDENCE OF AN INHOMOGENEOUS VALENCE ADMIXTURE IN THE AMORPHOUS  $Pd_{1-x}Ce_x$ .** Magnetic measurements were carried out on the amorphous  $Pd_{1-x}Ce_x$  alloys. The cerium electronic configuration is found to change from 'tetravalent' to trivalent over the concentration range  $0.125 \leq x \leq 0.25$  with increasing Ce composition. The presence of magnetic Ce ions indicates that the valence admixture is inhomogeneous in this system. This result suggests that fluctuations of short range order stabilize either the trivalent or the 'tetravalent' state. (Edited author abstract) 12 refs.

## PALLADIUM CHROMIUM ALLOYS

### Radiation Damage

**075978 PRECIPITATION AND IRRADIATION DAMAGE IN PROTON-IRRADIATED PALLADIUM-CHROMIUM ALLOYS.** Irradiation damage of Pd-Cr alloys containing 15, 20 and 25 at % Cr was studied over the temperature range 100 to 550°C, primarily in samples irradiated to a dose of 0.7 d.p.a. The solubility limit in this range of temperatures varies from 22 to 38% Cr, and precipitation of a phase having the  $L1_2$  crystal structure was observed in unirradiated samples of the 25% Cr alloy aged at temperatures as low as 100°C. Octahedrally shaped voids, with faces parallel to  $\{111\}$ , were found only in the 25% Cr alloy irradiated from 350 to 550°C but not in the other alloys at any temperature. The undersized chromium atoms migrate to point defect sinks during irradiation, resulting in solute segregation and precipitation under certain conditions. The precipitation of the  $L1_2$  phase, which is the thermodynamically stable phase at higher chromium contents, was irradiation-induced at dislocation loops, voids and grain boundaries in the more concentrated undersaturated alloys. This irradiation-induced precipitation was observed in the same samples containing 20 and 25% Cr but not in those containing 15% Cr. The behavior is compared with Pd-Fe and Ni-Si alloys. (Edited author abstract) 20 refs.

### Electric Conductivity

**075979 ANALYSIS OF THE ELECTRICAL CONDUCTIVITY OF THE TWO PHASE Pd H<sub>x</sub> SYSTEM.** The electrical conductivity of the two phase region of the Pd H<sub>x</sub> ( $0 \leq x \leq 0.65$ ) system at 20 K is described by a new semiphenomenological effective medium type equation. This equation has been shown to describe the conductivity of a wide variety of binary mixtures as a function of the conductivities of the two components ( $\rho_\alpha$  and  $\rho_\beta$  in the case of Pd H<sub>x</sub>) and two morphology parameters. One parameter is the critical volume fraction ( $f_c (=1 - f_\beta)$ ) at which the high conductivity phase first forms a continuous percolation path across the system. The other parameter, the exponent  $t$ , is a combination of the effective demagnetization coefficients of the components and the critical volume fraction. This parameter is discussed in terms of the known morphology of the samples. (Author abstract) 12 refs.

### Order-Disorder

**075981 LOW-TEMPERATURE EVOLUTION OF THE PROTON MAGNETIC RESONANCE LINE SHAPE IN  $\beta$ -PHASE PALLADIUM HYDRIDE.** Measurements of the proton magnetic resonance adsorption line shape in  $\beta$ -phase palladium hydride indicate that there is a short-range ordering associated with the order-disorder phase transition that occurs in the neighborhood of 50 K. However, measurements of the line shape in the range 10-30 K show a change from a Gaussian to a non-Gaussian profile. This effect is not related to the order-disorder phase transition. A possible explanation in terms of thermally assisted tunneling is proposed. (Author abstract) 26 refs.

### Stability

**075984 ON THE STABILITY OF THE ORDERED  $Pd_3V$  PHASE IN A PROTON-IRRADIATED Pd-15at. percent V ALLOY.** The maximum temperature at which the ordered  $Pd_3V$  phase forms in a Pd-15at. percent V alloy irradiated by 400 keV protons was determined to lie between 350 and 420 °C. Post-irradiation annealing experiments have established that  $Pd_3V$  is most probably a thermodynamically stable equilibrium phase with a critical ordering temperature slightly below 400 °C.  $Pd_3V$  is not expected to nucleate and grow under conditions of normal isothermal annealing (because of the low temperature range of its stability) unless diffusion is accelerated, in this case by charged particle irradiation. (Edited author abstract) 23 refs.

Chen, J. (Univ of California, Los Angeles, CA, USA); Ardell, A.J. *J Less Common Met* v 141 n 1 Jul 1988 p 45-53.

### Structure

**075985 STRUCTURAL PROPERTIES OF  $Pd_3Si_2$ .** The crystal structure of  $Pd_3Si_2$  has been determined and refined from X-ray single crystal diffractometer data.  $Pd_3Si_2$  crystallizes in space group Pnma (No. 62) with the unit cell dimensions  $a = 9.0528(4)$  Å,  $b = 7.4165(3)$  Å,  $c = 9.4009(4)$  Å, and four formula units per unit cell. The structure has been refined to a conventional R-value of 0.088. (Author abstract)

### Synthesis

**075986 COMPLEX COMPOUNDS OF Pd(II) WITH HISTIDINE.** The interaction of metallic ions with polypeptides and proteins is a problem of great interest in both coordination chemistry and biochemistry. The imidazole cycle in the molecule of histidine has a great biological importance: it also constitutes a possible way of linking metallic ions and insulin in the albumin serum. A great amount of research has been done on metal-histidine complexes. The study of D. Burk, A.L. Shade and M.L. Hesselbach on complex compounds of Co with histidine, that of P.Y. Morris referring to some chelates of Co(II), Ni(II) and Zn(II) with histidine can be quoted. More recently, Volstein and his coworkers published some papers dealing with the preparation and chemical characterization of a large series of complex combinations on Pt(II) with histidine. Taking into account the similarity of

behavior shown by Pd(II) and Pt(II), in the present paper we attempted the synthesis and chemical characterization of some complex combinations of Pd(II) with histidine. 8 refs.

## PALLADIUM COPPER ALLOYS

### Electronic Properties

**075989 POSITRON ANNIHILATION STUDIES ON THE ELECTRONIC STRUCTURE OF Pd<sub>1-x</sub>MOE<sub>x</sub> C<sub>u</sub>y ALLOYS.** The entire concentration range of α-phase Pd<sub>1-x</sub>Cu<sub>y</sub> alloys have been studied by angular correlation and positron lifetime methods. The conclusions concerning the electronic structure of these alloys are in agreement with SCF-KKR-CPA calculations. The comparison of the present results with the ones for Pd<sub>1-x</sub>Ag<sub>x</sub> alloys obtained previously allows one to confirm the idea that the behavior of the annihilation rate in random alloys can predict whether the split-band regime or VCA is the appropriate description of the electronic structure of a particular alloy. (Author abstract) 25 Refs.

Debowska, E. (Wrocław Univ, Wrocław, Pol); Rudzinska-Girulka, J. *Phys Scr* v 38 n 1 Jul 1988 p 103-108.

### Thermodynamic Properties

**075990 THERMODYNAMICS OF Pd-Cu-H SOLID SOLUTIONS.** Solubility isobars at various temperatures in the range 625-1250 K have been measured for Pd-Cu-H solid solutions containing 0-20 at.% Cu. The H-concentration was always less than approx. 10<sup>-3</sup> at.%. The variation with Cu-concentration of the partial molar thermodynamic functions of the H-atoms, deduced from the measurements, exhibit singularities not observed in other Pd-noble metal-H systems. The observed behavior has been explained using a statistical mechanical model for the solid solution. The contribution of effects related

to changes in the specific volume of the solution with Cu-concentration has been calculated from elastic data measured in the same range of temperature and composition. (Author abstract) 15 refs.

Yoshihara, M. (Rice Univ, Houston, TX, USA); McLellan, R.B. *Perspect in Hydrogen in Met, Collect Pap on the Eff of Hydrogen on the Prop of Met and Alloys* Publ by Pergamon Press, Oxford, Engl and New York, NY, USA, 1986 p 21-28.

## PALLADIUM COPPER SILICON ALLOYS

### Amorphous

**075991 H<sub>v</sub> CHANGE WITH COOLING CONDITION OF LIQUID-QUENCHED Pd<sub>0.775</sub>Cu<sub>0.06</sub>Si<sub>0.165</sub> ALLOY GLASS.** Micro-Vickers' hardness, H<sub>v</sub>, was studied for the liquid-quenched Pd<sub>0.775</sub>Cu<sub>0.06</sub>Si<sub>0.165</sub> alloy glass in relation to cooling conditions. The faster the cooling rate, the smaller the H<sub>v</sub> becomes. Based on the relaxation theory, we show the existence of an approximately linear relationship between H<sub>v</sub> and the sample thickness. 14 refs.

Nishi, Yoshitake (Tokai Univ, Hiratsuka, Jpn); Harano, Hidehiko; Ishizuki, Hisayoshi. *J Mater Sci Lett* v 6 n 12 Dec 1987 p 1445-1446.

**075992 HYDROGEN IN AMORPHOUS METALS - I.** The solubility and diffusivity of hydrogen in amorphous Pd<sub>77.5</sub>Cu<sub>6</sub>Si<sub>16.5</sub> and Ni<sub>49.9</sub>Pd<sub>31.8</sub>P<sub>18.3</sub> have been measured using an electrochemical method. The pressure-concentration isotherms show remarkable deviations from Sievert's Law while the amount of hydrogen dissolved lies in between the solubility of the components of the alloy. The diffusivity of hydrogen is rather high (about 10<sup>-8</sup> cm<sup>2</sup>/s) and it depends on temperature and also on concentration even at very low hydrogen levels contrary to crystalline metals. An equation is derived which relates the width of this function to the width of the radial distribution function which describes the structure of an amorphous alloy. Changes in this structure are believed to take place during annealing and were revealed by changes of hydrogen solubility. (Edited author abstract) 22 refs.

### Internal Friction

**075993 HYDROGEN RELATED INTERNAL FRICTION PEAKS IN AMORPHOUS AND CRYSTALLIZED Pd-Cu-Si ALLOYS.** A low frequency internal friction measurement by a torsion pendulum has been made on amorphous and crystallized Pd<sub>77.5</sub>Cu<sub>6</sub>Si<sub>16.5</sub> alloys, electrolytically charged with hydrogen. In the amorphous state, a relaxation peak appears in the temperature range 100-150 K. The peak increases its height and shifts towards lower temperatures with the increase in hydrogen concentration and exhibits the reverse trend on hydrogen desorption. On hydrogenation, crystallized specimens exhibit a large relaxation peak at about 170 K with a subpeak at 130 K. Possible origins of peaks are discussed in reference to the literature on Pd and Pd alloys. (Author abstract) 27 refs.

### Microstructure

**075994 HIGH RESOLUTION ELECTRON MICROSCOPIC STUDY OF THE STRUCTURE OF AMORPHOUS Pd<sub>77.5</sub>Cu<sub>6</sub>Si<sub>16.5</sub> ALLOY.** High resolution electron microscopy has been applied to microstructural observations of an amorphous Pd<sub>77.5</sub>Cu<sub>6</sub>Si<sub>16.5</sub> alloy.

In all specimens prepared at different cooling rates, images of microcrystalline domains were observed and the formation of medium range order in this alloy was proved. The average size of these domains varies from 3.0 to 1.5 nm depending on the cooling rate and melt temperature on cooling. From the geometries of the crossed-lattice images and micro-area electron diffraction, the structure of the domains is identified as a face centered cubic structure. (Edited author abstract) 34 refs. In Japanese.

## PALLADIUM COPPER SILVER ALLOYS

### Order-Disorder

**075995 FIELD EMISSION MICROSCOPY OF THE EARLY STAGES OF ORDERING AND DECOMPOSITION OF ALLOY PALLADIUM-COPPER-SILVER.** The method of field emission microscopy was used to study the initial stages of decomposition and atomic ordering of type B2 in alloy PdCuAg. The order in which the phases arise and the shape and size of particles at the early stages of decomposition are established. At the atomic level, cell boundaries and particle-matrix phase interfaces are observed. The alloy contained 50.0 wt.% Pd 25.0 wt.% Cu 25.0 wt.% Ag. 5 refs.

## PALLADIUM ERBIUM ALLOYS

### Crystallization

**075996 ION- AND ELECTRON-BEAM INDUCED REACTIONS IN MICROCRYSTALLINE Pd<sub>3</sub>Er.** This paper describes the results of an investigation which was originally intended to differentiate between some amorphous phases produced as a result of ion beam thinning and by interdiffusion between the Si substrate and superposed microcrystalline Pd<sub>3</sub>Er. In the former category of processes are included the increased propensity of a material such as Pd<sub>3</sub>Er to form amorphous oxide on exposure to air after ion irradiation. The authors also found that the Pd-Er can undergo both ion and electron beam-induced reactions and discuss these as of interest in their own right. It is demonstrated that a low voltage (5 kv) argon ion beam can promote amorphization with the incorporation of oxygen and that an 100 kv electron beam can accelerate crystallization. 7 refs.

## PALLADIUM GOLD ALLOYS

### Gases

**075997 SOLID SOLUTIONS OF Pd CONTAINING HYDROGEN AND A NOBEL METAL SUBSTITUTIONAL COMPONENT - II. KINETIC BEHAVIOR.** An electrochemical cell method has been used to measure the diffusivity of hydrogen in Pd-Au solid solution in the temperature range 273-360 K and in the concentration range 1-50 at.% Au. Up to 10 at.% Au the mobility of H in the metal lattice is virtually unaffected by the presence of Au in the solid solution. There is then an increase in mobility with increasing Au-concentration. This phenomenon has been interpreted in terms of a statistical model in which interstitial sites adjacent to Au atoms act as antitraps. (Author abstract) 9 refs.

## Spectroscopic Analysis

**075998**  $N_{6,7}$  SOFT X-RAY EMISSION SPECTRA OF PLATINUM-GOLD ALLOYS. The  $N_{6,7}$  soft x-ray spectra of platinum and gold from a series of platinum-gold alloys have been measured and their energies adjusted to compensate for the  $N_6$  and  $N_7$  core level shifts which were measured by XPS. The results are compared with the theoretical spectra published by Weinberger et al. The overall agreement in band shapes, peak positions and band widths is good and possible causes of minor discrepancies are discussed. (Author abstract) 13 refs.

## Heat Treatment

**075999** DISCONTINUOUS COALESCENCE OF DOMAINS IN ORDERED ALLOY PdFe. Discontinuous coalescence realized by means of grain boundary migration has previously been observed as the result of discontinuous decomposition,  $L1_2$  type ordering and during recovery of the grain in certain steels. Grain boundary displacement has been discovered (with the optical method) in ordered alloy NiPt (after quenching  $L1_0$ ). A more detailed investigation of that effect in alloys of this kind is of interest. Using the method of transmission electron microscopy of foils, the authors have observed and studied grain boundary migration in the ordered alloy PdFe ( $T_c$  680 °C). 9 refs.

## Magnetic Properties

**076000** MAGNETIC BEHAVIOR OF HYDROGENATED ORDERED ALLOY Pd<sub>3</sub>Fe IN THE RANGE OF COEXISTENCE OF TWO MAGNETIC SUBSYSTEMS. On the basis of a Mossbauer analysis and magnetization measurements of hydrogenated alloy Pd<sub>3</sub>Fe, the authors consider the magnetic state of the alloys as a set of two interconnected subsystems - a ferromagnetic  $\alpha$  and antiferromagnetic  $\beta$ -phase. The hyperfine field on the nucleus of <sup>57</sup>Fe changes rapidly in the  $\alpha$ -phase of the relative volume of  $\beta$ -phase in the specimen is more than 50%. The magnetization grows when the specimen is cooled in a magnetic field. (Edited author abstract) 5 refs.

## Mechanical Properties

**076001** INFLUENCE OF ORDERING ON BEHAVIOUR OF THE ELECTRICAL RESISTIVITY AND MECHANICAL PROPERTIES OF ALLOY PdFe DURING DEFORMATION. The methods of electrical resistivity, X-ray crystallographic analysis and electron microscopy were used to investigate the disturbance of short- and long-range atomic order and the behavior of the mechanical properties during deformation by drawing of alloy PdFe with different initial degrees of ordering and structure states. The highest strength properties are obtained by deforming the partially or totally ordered alloy to a certain degree (0.3-0.7). Higher degrees of deformation are required to achieve the same results during drawing of the unordered alloy. (Author abstract) 12 refs.

## PALLADIUM MANGANESE ALLOYS

## Microstructure

**076002** EVIDENCE FROM HYDROGEN SOLUBILITY STUDIES FOR ORDERING IN HYPOSTOI-

CHIOMETRIC ALLOYS OF Pd<sub>3</sub>Mn. The abrupt increases in hydrogen solubility and electrical resistance as quenched samples of hypostoichiometric Pd<sub>3</sub>Mn are heated is attributed to ordering of the alloy matrix. Low temperature hydrogen solubility comparisons of quenched and slowly cooled alloys show large differences which further support the contention that ordered forms of these alloys exist. In addition, electron diffraction patterns of the slowly cooled alloys show weak superlattice reflections indicative of the Ag<sub>3</sub>Mg structure. 6 refs.

## PALLADIUM NICKEL ALLOYS

## Amorphous

**076004** SURFACE CRYSTALLIZATION OF MELT-SPUN Pd<sub>40</sub>Ni<sub>40</sub>Pd<sub>20</sub> GLASS. The crystallization of Pd<sub>40</sub>Ni<sub>40</sub>Pd<sub>20</sub> glass, produced by melt-spinning in air, has been studied by optical metallography. Crystallization is predominantly from the surface and is more prevalent on the wheel-side. The non-uniformity is attributed to variation in quench rate during production. A three-stage anneal permits crystals which have nucleated at the surface to be identified and their size distribution to be analyzed. The surface nucleation is heterogeneous and appears to be hindered by mild oxidation. The annealing atmosphere markedly affects the surface crystallization behavior, as does removal of the original ribbon surface. When nucleation is sparse, partial crystallization causes the development of noticeable relief on the sample surfaces. (Author abstract) 9 refs.

Garcia Escorial, A. (Centro Nacional de Investigaciones Metalurgicas, Madrid, Spain); Greer, A.L. *J Mater Sci* v 22 n 12 Dec 1987 p 4388-4394.

**076005** ON THE MICROSTRUCTURE OF AMORPHOUS Pd<sub>46</sub>Ni<sub>36</sub>P<sub>18</sub> WITH TWO GLASS TRANSITIONS. The authors performed microscopic observations on thin foils of annealed amorphous Pd<sub>46</sub>Ni<sub>36</sub>P<sub>18</sub>. A phase separation phenomenon leading to the occurrence of two glass transitions intervenes at 605 < T < than 630 K. Immediately after completion of this reaction the scale of the phase separated zones  $r \leq 1.0$  nm and their electron density contrasts are too low to be detected before coarsening on further annealing which allows their detection once  $r > 1.0$  nm. The phase separation seems to produce zones depleted in Pd and richer in P and vice versa but does not seem to be a precursor to the nucleation of the NiPd fcc solid solution that is the first crystallization product at T  $\geq 630$  K. 9 refs.

## Structure

**076007** ELECTRONIC STRUCTURE OF Pd<sub>1-x</sub>Ni<sub>x</sub> ALLOYS INVESTIGATED BY POSITRON ANNIHILATION. The entire concentration range of  $\alpha$ -phase Pd<sub>1-x</sub>Ni<sub>x</sub> alloys is studied by angular correlation and positron lifetime methods. The electron number per one alloy atom is analyzed and the progressive delocalization of d-like electrons with increasing Ni concentration is postulated. Attention is also paid to the problem of annihilation rate in alloys. The changes in the character of annihilation parameter dependences on x are seemed to be connected with para- to ferromagnetic transition. (Author abstract) 16 refs.

Debowska, E. (Univ of Wroclaw, Wroclaw, Pol); Rudzinska-Girulski, J. *Phys Status Solidi B* v 148 n 1 Jul 1988 p 227-231.

## Thermodynamic Properties

**076008** THERMODYNAMICS OF TERNARY PALLADIUM-BASED SOLID SOLUTIONS CONTAINING NICKEL AND HYDROGEN. The solubility of hydrogen in Pd-Ni-H ternary solutions in equilibrium with H gas at atmospheric pressure has been measured in the temperature range 625-1250 K and in Pd-Ni 'binary solvents' containing up to 80 at.% of Ni. Concomitant elastic measurements have provided data which enable the partial thermodynamic functions of the H-atoms, deduced from the solubility measurements, to be converted so as to refer to a hypothetical Pd-Ni lattice of constant specific volume. The resulting 'volume corrected' functions have been discussed in terms of the cell model for ternary solutions and have been shown to vary with temperature and Ni-concentration in a manner in accord with this mode. The usual linear form of cell interaction energy spectrum has been modified by including supplemental contributions to the cell interaction energy which occur when substitutional solute atoms occupy adjacent sites on the fcc Pd-Ni lattice. (Author abstract) 24 refs.

## Thin Films

**076009** ENHANCEMENT OF THE MAGNETIC HYSTERESIS IN ULTRATHIN PdNi FILMS BY HYDROGEN ABSORPTION-DESORPTION CYCLING. Measurements of the magnetic hysteresis in ultrathin PdNi films ( $d \leq 100$  Å) show a marked increase of the perpendicular coercive field after hydrogen absorption-desorption cycling; a squaring up of the magnetic hysteresis is observed at the same time. We attribute tentatively this effect to an irreversible change of the stress state of the film in relation with the film-substrate interaction. (Author abstract) 11 refs.

# PALLADIUM NICKEL SILICON ALLOYS

## Amorphous

**076011 ANNEAL-INDUCED ENTHALPY RELAXATION BEHAVIOUR OF AMORPHOUS (Pd<sub>0.7</sub>Ni<sub>0.3</sub>)<sub>83</sub>Si<sub>17</sub> ALLOY BY X-RAY DIFFRACTION.** The main purpose of this letter is to present some new systematic X-ray diffraction measurements on structural relaxation which occur in the metallic glass (Pd<sub>0.7</sub>Ni<sub>0.3</sub>)<sub>83</sub>Si<sub>17</sub> caused by annealing. Glass samples of (Pd<sub>0.7</sub>Ni<sub>0.3</sub>)<sub>83</sub>Si<sub>17</sub> were prepared in the shape of ribbons (about 10 mm wide and 0.3 mm thick) by rapid quenching from the melt. These glass samples were annealed in evacuated quartz capsules under the required conditions and the densities were measured by Archimedes method with toluene. The most striking results in this work are the detection of changes corresponding to the anneal-induced enthalpy relaxation and such changes clearly contrast with the previous results of the irreversible relaxation due to low-temperature annealing. 20 Refs.

Waseda, Y. (Tohoku Univ, Sendai, Jpn); Matsubara, E.; Ohzora, M.; Tsai, A.P.; Inoue, A.; Masumoto, T. *J Mater Sci Lett* v 7 n 9 Sep 1988 p 1003-1006.

## Electric Conductivity

**076012 ANNEALING EFFECT ON THE ELECTRICAL RESISTIVITY OF Pd-SiBASED ALLOYS.** The authors investigated the electrical resistivity changes of Pd<sub>77.5</sub>Ni<sub>16.5</sub>Si<sub>6.5</sub> in the temperature region before crystallization. The temperature dependence of relative electrical resistivity of Pd<sub>77.5</sub>Ni<sub>16.5</sub>Si<sub>6.5</sub>, Pd<sub>77.5</sub>Cu<sub>6</sub>Si<sub>16.5</sub> and Pd<sub>80</sub>Si<sub>20</sub> is shown. Du scanning from room temperature to 820 K, the relative electrical resistivity of the glassy matrix increases with temperature and a drop appears near T<sub>x</sub> (the crystallization temperature). However, the resistivity curve has a hump near the glass transition temperature T<sub>g</sub> for an as-received specimen of Pd<sub>77.5</sub>Ni<sub>16.5</sub>Si<sub>6.5</sub>, Pd<sub>77.5</sub>Cu<sub>6</sub>Si<sub>16.5</sub> and such a hump was not observed for Pd<sub>80</sub>Si<sub>20</sub>. During isothermal annealing the electrical resistivity of Pd<sub>77.5</sub>Ni<sub>16.5</sub>Si<sub>6.5</sub> varies depending on the annealing temperatures. The variation of internal friction during isothermal annealing at different temperatures is similar to that of the electrical resistivity measurements. 7 Refs.

# PALLADIUM PLATINUM ALLOYS See METALS AND ALLOYS—Impurities.

# PALLADIUM RHENIUM ALLOYS

## Oxidation

**076014 PdRhO<sub>2</sub> FORMATION DURING THE AIR OXIDATION OF A Pd-15Rh ALLOY.** The surfaces of air-oxidized Pd-15Rh alloys have been examined by X-ray photoelectron spectroscopy (XPS) and Raman spectroscopy. The XPS results indicate that the near-surface region of samples oxidized in the temperature range 1075 to 1125 K contains Pd in both the +2 and +1 oxidation states and Rh in the +3 oxidation state. The ratio of Pd (I) to Rh (III) is 1:1. Raman spectra confirm that two Pd-containing phases, PdO and PdRhO<sub>2</sub>, are present in the near-surface region and eliminate the possibility that Rh<sub>2</sub>O<sub>3</sub> is present. A resonant Raman effect is observed in anhydrous PdO for exciting wavelengths in the vicinity of 500 nm. (Author abstract). 13 Refs.

# PALLADIUM RHODIUM ALLOYS

## Decomposition

**076015 STUDY OF THE Pd-Rh SYSTEM BY ELECTRICAL RESISTIVITY MEASUREMENTS.** The phase diagram results of this experiment differ slightly from those of Raub. Generally, decomposition was found to occur at higher temperatures. Presumably the reason for this is that the resistivity method detects phase separation on a very fine scale as takes place in spinodal decomposition, while earlier results only detected discontinuous precipitation of the two phases. Raub et al. report two lattice parameters for their samples which were aged for long times. Present results show only one lattice parameter as would be expected if separation were taking place on a scale of about 10 nm. 7 refs.

**076016 ELECTROCHEMICAL STUDIES OF HYDROGEN SORPTION BY Pd<sub>84.5</sub>Si<sub>15.5</sub> AMORPHOUS ALLOY.** It is the aim of this work to study hydrogen sorption and diffusion in Pd<sub>84.5</sub>Si<sub>15.5</sub> alloy (amorphous and crystalline), and to compare the data obtained with similar characteristics for pure Pd. It was found that the concentrations of sorbed hydrogen found in Pd<sub>84.5</sub>Si<sub>15.5</sub> amorphous alloy at the potentials of the α-phase are somewhat higher than those found in palladium. It was found when estimating the ratio between dissolved and adsorbed hydrogen that in the amorphous alloy, the amount of dissolved hydrogen is about an order of magnitude larger than that of adsorbed hydrogen. Electrochemical studies of hydrogen sorption have demonstrated a decrease of hydrogen solubility in the order of: Pd > Pd<sub>84.5</sub>Si<sub>15.5</sub> amorphous alloy > Pd<sub>84.5</sub>Si<sub>15.5</sub> crystalline alloy. 14 refs.

## Amorphous See Also HYDROGEN—Solubility.

**076017 ANISOTROPY IN YOUNG'S MODULUS OF NONFERROMAGNETIC AMORPHOUS WIDE RIBBONS.** Pd-Si and Ni-Si-B amorphous wide ribbons were prepared by the melt-quenching method, and Young's modulus as a function of angle to the ribbon direction has been investigated in the as-prepared, annealed and rolled states. It has been confirmed that these alloys show a large elastic anisotropy in both as-prepared

and annealed states and the anisotropy does not disappear even after full annealing. The elastic anisotropy is enhanced by cold-rolling. By rolling to the width direction of the specimen, the anisotropy becomes large in the direction of the ribbon axis. From the present results it is concluded that the amorphous alloys produced by melt-quenching inherently have the elastic anisotropy. (Author abstract) 19 refs.

**076019 DISSOLUTION CHARACTERISTICS AND OCCUPANCY SITES OF HYDROGEN IN AMORPHOUS PdSi ALLOYS: PART I.** Hydrogen solubility has been studied in three amorphous PdSi alloys with silicon contents of 14, 18 and 20 at.%. Hydrogen charging was achieved by heating in the temperature range 20-200°C in an atmosphere of hydrogen gas at pressures up to 12 MPa. The dissolved hydrogen concentrations were analyzed by in situ electrical resistivity and thermogravimetry measurements. The heat of solution was determined for hydrogen concentrations ranging from about 0.1 to 6 at.%. The heat of solution was found to depend markedly on the dissolved hydrogen content. (Edited author abstract) 25 refs.

Magnouche, A. (CNRS, Vitry-sur-Seine, Fr); Fromageau, R.; Hillairet, J. *J Less Common Met* v 138 n 2 Mar 15 1988 p 323-336.

**076020 DIFFUSION CHARACTERISTICS OF HYDROGEN IN AMORPHOUS Pd<sub>80</sub>Si<sub>20</sub>: PART II.** Measurement of the kinetics of hydrogen uptake and outgassing in response to the application or release of gas pressure enabled us to make a detailed analysis of the hydrogen mobility in melt-spun Pd<sub>80</sub>Si<sub>20</sub>. The diffusion coefficient of hydrogen was found to be dependent on hydrogen concentration. It increased by a factor of about two when the concentration of dissolved gas increased from 0 to 0.2 at.%. The progressive enhancement of hydrogen mobility reflects the existence of a broad continuous energy spectrum of the available sites. At very low concentrations, a typical value for the migration enthalpy of hydrogen is 0.43 eV (41 kJ mol<sup>-1</sup>). (Author abstract) 18 refs.

Fromageau, R. (CNRS, Vitry-sur-Seine, Fr); Magnouche, A.; Brebec, G.; Hillairet, J. *J Less Common Met* v 138 n 2 Mar 15 1988 p 337-348.

**076021 STUDY OF THE HYDROGEN DISTRIBUTIONS IN AMORPHOUS Pd<sub>80</sub>Si<sub>20</sub> BY THERMAL EVOLUTION OF HYDROGEN.** Hydrogen thermal desorption study in amorphous Pd<sub>80</sub>Si<sub>20</sub> provides phenomenological evidence for a distribution of hydrogen among sites of different energy caused by disorder in an amorphous metal. As a consequence, at low temperatures the sites of low energy are filled first. With increasing concentration, hydrogen occupies sites of higher energy. At higher temperatures or low concentrations, distribution of hydrogen in sites becomes independent of concentration. The dissolution of hydrogen is exothermic. The

pressure-concentration isotherms show deviations from Sievert's law at temperatures between 303 and 473 K for hydrogen pressures between 0.05 and 1 atm. This is attributed to the larger enthalpy of dissolution at higher concentrations, which is related to the distribution of hydrogen atoms in sites of different energies. (Edited author abstract) 21 refs.

Lee, Sung-Man (Korea Advanced Inst of Science & Technology, Seoul, South Korea); Lee, Jai-Young. *Acta Metall* v 36 n 3 Mar 1988 p 605-611.

**076022 RELATION BETWEEN VISCOSITY AND DIFFUSION IN AMORPHOUS METALLIC ALLOYS.** The main characteristics of creep and diffusion data in metallic amorphous alloys (PdSi and FeNiB types) are presented. It is shown that the free volume model cannot satisfactorily explain these data, particularly the different behaviour with respect to the kinetics of relaxation. The creep behaviour of Metglas is qualitatively similar to that of polycrystals at high temperature. From a macroscopic point of view, the Nabarro-Herring (or Coble) models are able to account for creep and diffusion experiments. (Edited author abstract) 49 refs.

**076023 EFFECT OF Cr AND Si COATING ON THE STABILITY AND KINETICS OF CRYSTALLIZATION OF Pd<sub>77</sub>Si<sub>23</sub> AMORPHOUS RIBBONS.** The DSC and metallography are used to study the influence of coating with silicon and chromium on the stability of Pd<sub>77</sub>Si<sub>23</sub> amorphous alloys. General requirements for a good coating material are discussed. (Author abstract) 9 refs.

Calka, A. (Australian Natl Univ, Canberra, Aust); Radlinski, A.P. *Key Eng Mater* v 13 pt 2 1987, Int Conf on Met and Semicond Glasses (MSG-86), Hyderabad, India, Dec 16-20 1986 p 303-306.

## Deformation

**076024 HYDROGEN IN DEFORMED AND AMORPHOUS Pd<sub>80</sub>Si<sub>20</sub> COMPARED TO HYDROGEN IN DEFORMED AND CRYSTALLINE PALLADIUM.** The purpose of this study is to present experimental results on hydrogen activity, diffusivity and resistivity increment in amorphous Pd<sub>80</sub>Si<sub>20</sub> before and after cold rolling and compare it with the corresponding quantities in crystalline Pd. In amorphous Pd<sub>80</sub>Si<sub>20</sub> the three quantities, emf, diffusivity, resistivity-increment, show a different concentration dependence when compared with the crystalline Pd. This is due to a broad distribution of site energies for hydrogen in amorphous metals. 11 refs.

Kirchheim, R. (Max-Planck-Inst fuer Metallforschung, Stuttgart, West Ger); Szokefalvi-Nagy, A.; Stolz, U.; Speitling, A. *Perspect in Hydrogen in Met, Collect Pap on the Eff of Hydrogen on the Prop of Met and Alloys* Publ by Pergamon Press, Oxford, Engl and New York, NY, USA, 1986 p 99-102.

## Internal Friction

**076025 GORSKY EFFECT MEASUREMENTS ON AMORPHOUS Pd<sub>80</sub>Si<sub>20</sub>H<sub>x</sub> BETWEEN 290 AND 490 K.** Authors have performed Gorsky-effect measurements on amorphous Pd<sub>80</sub>Si<sub>20</sub>H<sub>1.2</sub> in the temperature range 290-490 K. For T > 350 K the relaxation process cannot be described by a single relaxation time. In addition to the hydrogen related relaxation process a recoverable creep process independent of hydrogen content is observed. Surprisingly the activation energy associated with the creep process (E = 0.32 eV) is comparable to the activation energy of the hydrogen diffusion process (E<sub>a</sub> = 0.290 ± 0.005 eV). Within experimental error no temperature dependence of the relaxation strength of the Gorsky-effect has been observed. This is associated with both a large 'repulsive' long range H-H interaction of electronic origin and to a low density-of-sites function in the domain of energy of the sites occupied in Pd<sub>80</sub>Si<sub>20</sub>H<sub>x</sub> at low concentrations. 16 refs.

## Thin Films

**076027 SIMULATION OF FRACTAL-LIKE STRUCTURES IN BILAYER Pd-Si ALLOY FILMS.** Fractal-like structures have been observed in evaporated Pd-Si bilayer alloy films after the crystallization of a-Si at 400°C or more. A model for the formation of these structures has been proposed. The formation of these structures is the consequence caused by the latent heat released quickly during the crystallization of a-Si and during void formation. The simulation results of our model yields the fractal-like structures which is scale invariant and similar to that of the experimental results. (Edited author abstract) 15 refs.

Duan, Jian-Zhong (Univ of Science & Technology, Hefei, China); Li, Yan; Wu, Zi-qin. *Solid State Commun* v 65 n 1 Jan 1988 p 7-10.

**076028 APPEARANCE OF NEGATIVE FRACTAL-LIKE STRUCTURES IN Pd-Si ALLOY FILMS.** The fractal-like structures, or irregular holes, appear in silicide film after the crystallization of a-Si when the annealing temperature reaches 400-500°C. The fractal dimension of these holes decreases with increasing Si concentration. The structures and compositions of different regions investigated by TEM, HREM, Scanning Auger Microprobe and X-ray EDS show that only Si exists in the fractal-like region, so it is a negative fractal-like structure which is caused by diffusion of Pd atoms away from this region and is contrary to the DLA (diffusion-limited aggregation), a positive fractal-like structure caused by diffusion of atoms towards this region. Crystallized Si is quite perfect but with many twins and stacking faults, especially near the edge of these regions. The mechanism of appearance of fractal-like region and its growth process is discussed. (Edited author abstract) 13 refs.

## PALLADIUM SILICON COPPER ALLOYS

### Amorphous

**076029 SOLUBILITY, DIFFUSIVITY AND TRAPPING OF HYDROGEN IN DILUTE ALLOYS, DEFORMED AND AMORPHOUS METALS - II.** The chemical potential and diffusivity of interstitial solute atoms was calculated for disordered materials in a general way. Disorder may be of chemical nature as in alloys or caused by a strain field as around dislocations and a crack tip or disorder may be as total as in an amorphous alloy. For these examples of disordered systems relations were derived from a general expression and compared with corresponding special theoretical results which are mostly related to attractive interaction (trapping) and repulsive interaction (antitrapping) between interstitially and substitutionally dissolved impurity atoms. A comparison with experimental results is namely made for the solubility

and diffusivity of hydrogen in dilute alloys, deformed Fe and Pd and amorphous Pd<sub>77.5</sub>Si<sub>16.5</sub>Cu<sub>6</sub> and Ni<sub>64</sub>Zr<sub>36</sub>. (Author abstract) 29 refs.

Kirchheim, R. (Max-Planck-Inst fuer Metallforschung, Stuttgart, West Ger). *Perspect in Hydrogen in Met, Collect Pap on the Eff of Hydrogen on the Prop of Met and Alloys* Publ by Pergamon Press, Oxford, Engl and New York, NY, USA, 1986 p 549-558.

## PALLADIUM SILVER ALLOYS

### Electronic Properties

**076030 ELECTRONIC STRUCTURE OF Pd<sub>1-x</sub>Ag<sub>x</sub> ALLOYS ON THE BASIS OF POSITRON ANNIHILATION DATA.** The angular correlation and positron lifetime measurements were used to investigate α-phase Pd<sub>1-x</sub>Ag<sub>x</sub> alloys throughout the concentration range. On the basis of the annihilation parameters the numbers of s-like and d-like electrons per one alloy atom were calculated. These numbers are in agreement with the KKR-CPA calculation results. The linearity of positron annihilation rate λ vs. Ag concentration confirms the earlier suggestion concerning the character of λ(x) for random alloys whose densities of states represent split-band regime. (Author abstract) 17 Refs.

Rudzinska-Girulska, J. (Wroclaw Univ, Wroclaw, Pol); Debowska, E. *Phys Scr* v 37 n 6 Jun 1988 p 952-956.

### Thermodynamic Properties

**076031 THERMODYNAMICS OF Pd-Ag-H TERNARY SOLID SOLUTIONS.** The solubility of hydrogen in Pd-Ag-H ternary solutions in equilibrium with H<sub>2</sub> gas at atmospheric pressure has been measured in the temperature range 625-1111 K and in Pd-Ag 'binary solvents' containing up to 93 at.% of Ag. Concomitant elastic measurements have provided data which enable the partial thermodynamic functions of the H-atoms deduced from the solubility measurements to be converted so as to refer to a hypothetical Pd-Ag lattice of constant specific volume. The resulting 'volume corrected' functions have been discussed in terms of the cell model for ternary solutions and have been shown to vary with temperature and Ag-concentration in a manner in accord with this model. (Author abstract) 35 refs.

Yoshihara, M. (Rice Univ, Houston, TX, USA); McLellan, Rex B. *Perspect in Hydrogen in Met, Collect Pap on the Eff of Hydrogen on the Prop of Met and Alloys* Publ by Pergamon Press, Oxford, Engl and New York, NY, USA, 1986 p 69-76.

## PALLADIUM VANADIUM ALLOYS

### Phase Diagrams

**076032 Pd-V (PALLADIUM-VANADIUM) SYSTEM.** The major features of the existing diagram are compatible with currently available information. However, there are some differences with respect to detail. Specifically, the diagram has been modified to incorporate currently accepted melting points for Pd and V and later work concerning the range of homogeneity of PdV<sub>3</sub>. Temperatures and compositions associated with the invariant reactions in the system are summarized. 13 refs.

Smith, J.F. (Iowa State Univ, Ames, IA, USA). *J Alloy Phase Diagrams* v 4 n 1 Jan 1988 p 1-4.

## PALLADIUM YTTRIUM ALLOYS

### Gas Alloying

**076033 THERMODYNAMICS OF HYDROGEN IN PALLADIUM-YTTRIUM SOLID SOLUTIONS.** An equilibrate-quench-analyze technique has been used to measure solubility isobars at 10<sup>5</sup> N/m<sup>2</sup> in the Pd-Y-H system over the temperature span 625-1250 K. These data have been used to derive the dependence upon Y-content and temperature of the partial molar enthalpy and excess entropy of dissolved H-atoms. The partial enthalpy

decreases at all temperatures rapidly as the concentration of Y increases. Virtually all of the large variation is ascribable to the effects of lattice dilation in the Pd-Y matrix as the Y-concentration increases. (Author abstract) 19 refs.

Yoshihara, M. (William Marsh Rice Univ, Houston, TX, USA); McLellan, R.B. *Acta Metall* v 36 n 2 Feb 1988 p 385-391.

## Thermodynamics

**076034 THERMODYNAMIC STUDY OF THE PALLADIUM-YTTRIUM-HYDROGEN SYSTEM.** Equilibrium isobars for the ternary solid solution Pd-Y-H have been measured in the temperature range 625-1250 K and the composition range 0-13 at. % Y. The maximum H content was 1.5 at. %. The isobars were determined at six different pressures ranging from  $1.01 \times 10^3$  to  $1.01 \times 10^5$  N/m<sup>2</sup>. The resulting partial thermodynamic functions for H atoms in the solid solution are in good accord with the predictions of the cell model for such systems. (Author abstract) 15 refs.

Yoshihara, Michiko (William Marsh Rice Univ, Houston, TX, USA); McLellan, Rex B. *J Phys Chem Solids* v 49 n 4 1988 p 401-407.

## PAPER See Also ACIDS—Electric Properties.

**076035 CHEMICAL CARBONLESS COPY PAPER.** Chemical carbonless copy paper (CCP) is one among the fastest growing segments of the paper industry, with a worldwide growth rate of about 10% per year. There are tremendous developments in technology for producing this paper, since the time, the first chemical carbonless copy paper was put into market in 1954. The CCP may be characterized by a combination of an electron donor acceptor solid surface chemical reaction giving distinctive color, with new techniques of micro-encapsulation of chromogenic material in oil drops. The present paper discusses the development and status of CCP technology. (Author abstract). 15 Refs.

## Absorption See PAPER PRODUCTS—Physical Properties.

## Applications See PAPERMAKING.

## Calendering

**076036 CONTROL SYSTEMS FOR CALENDERS AND SUPERCALENDERS - POTENTIAL AND LIMITATIONS.** The calendering and supercalendering operations can be controlled to produce either a uniform thickness profile or uniform surface property profiles. To achieve both, the basis weight and moisture content of the paper must also be uniform. Hence, the full potential of calender control cannot be realized in isolation from the other papermaking operations. The development of new control strategies which will make better use of the information from currently available on-line sensors, will provide an interesting and potentially rewarding challenge for process and control engineers for years to come. (Author abstract) 14 refs.

Crotogino, R. (PAPRICAN, Pointe Claire, Que, Can); Gendron, S. *Pulp Pap Can* v 88 n 11 Nov 1987 p 44-49.

**076037 CALENDER STEAM SHOWERS: A NEW, EFFECTIVE MEANS OF HOT CALENDERING.** A new design of steam shower is now being applied at the calender stack to achieve hot calendering. Recent on-machine experience has shown up to 30% improvement in smoothness can be gained on newsprint and specialty groundwood grades. Because the smoothing effect is greater on the side of application, reduced two-sidedness is possible. Fiber softening achieved through steam calendering enhances the calendering effect while reducing calender nip damage. (Edited author abstract) 2 refs.

Hilden, K.K. (Devron-Hercules Inc, North Vancouver, BC, Can); Sawley, D. *Pulp Pap Can* v 88 n 12 Dec 1987 p 195-198.

**076038 HARD-NIP AND SOFT-NIP CALENDERING OF UNCOATED GROUNDWOOD PAPERS.** A review is presented of well-established and newly-emerging calendering techniques for the finishing of uncoated groundwood papers. The basic differences between the hard-nip and soft-nip calendering techniques are also discussed briefly. Machine calendering, gradient techniques, on-line soft calenders and supercalenders are considered. The choice of the most appropriate calendering technology requires a cost/benefit analysis based on incomplete and rapidly changing information. (Author abstract) 28 refs.

Crotogino, R.H. (Paprican, Pointe Claire, Que, Can); Gratton, M.F. *Pulp Pap Can* v 88 n 12 Dec 1987 p 208-216.

**076039 PRACTICAL APPLICATIONS OF NEW CALENDERING TECHNIQUES.** The benefits of recent calendering developments have been documented under production conditions in paper mills in North America and Scandinavia. New installations and upgrades to existing installations show that the latest calendering development offer higher productivity, enhanced calendering, tighter quality control, and the potential for full integration of on-line soft calenders with the papermaking process.

Malkia, Hannu P. (Valmet Paper Machinery Inc, Jarvenpaa, Finl). *Tappi J* v 71 n 5 May 1988 p 83-85.

**076040 EFFECT OF SUPERCALENDERING ON THE STRENGTH PROPERTIES OF PAPER.** Formette handsheets with varying levels of fibre orientation and wet pressing were subjected to supercalendering. Losses in elastic properties were found with increased supercalender loading. Inplane elastic anisotropy decreased with densification by wet pressing, and increased with densification by supercalendering. Tensile and compressive strength losses with supercalendering were not as great as might be expected from losses in elastic properties. Therefore correlations between elastic and failure properties are expected to be modified by calendering and supercalendering. (Author abstract) 24 refs.

Charles, L.A. (Inst of Paper Chemistry, Appleton, WI, USA); Waterhouse, J.F. *J Pulp Pap Sci* v 14 n 3 May 1988 p 59-65.

**076041 EFFECTS OF Z-DIRECTION MOISTURE AND TEMPERATURE GRADIENTS IN THE CALENDERING OF NEWSPRINT.** Temperature-gradient and moisture-gradient calendered papers exhibited much higher gloss, somewhat lower ink transfer and higher set-off than conventionally calendered paper having the same bulk. However, the gradient techniques appear to be able to produce high-gloss paper exhibiting less set-off than high-gloss machine calendered paper. Moisture-gradient calendering produced essentially the same results as temperature-gradient calendering, when both were carried out at the same roll temperature. The application of moisture onto the web prior to calendering did not provide any substantial net benefits. (Edited author abstract). 18 Refs.

## Coating See Also PAPER AND PULP MILLS—Machinery; PAPERMAKING—Taiwan.

**076043 COATER MEASUREMENT AND CONTROL: STATE-OF-THE-ART.** On-line measurement and control systems are being effectively applied to on-machine and off-machine coaters of all types. An array of sensors is available for these applications. The sensors include those for weight, moisture, ash, opacity, brightness, formation and caliper. Both machine-direction and cross-machine controls have been applied in coater applications. Advanced control techniques have also been used such as co-ordinated speed change, throughput optimization, start-up control and automatic grade change. (Edited author abstract) 7 refs.

Shapiro, S.I. (Aeonic Systems, Billerica, MA, USA). *Pulp Pap Can* v 88 n 8 Aug 1987 p 76-79.

**076044 NEW COATING TECHNOLOGY.** Because the technology of the size press has not kept pace with PM technology it can impose limitations on a high speed operation. Online surface treatment can, for example, cause poor runnability and detract from the efficiency of a first class machine. To overcome this problem a short dwell coater and blade metering size press have been introduced. The latter is being used by most American LWC mills, and they report improved runnability and reduce downtime and coating losses. (Author abstract)

## Marketing

**076052 HOW TO MARKET QUALITY NOT QUANTITY.** Swiss woodfree papermaker Cham-Tenero knows how to stay up in the clouds with the giants of the sector. Strong marketing and a top quality target sell its coated printing and specialty grades. In this article the author reports on this papermaker. Its range includes double-coated art papers and label papers.

Sutton, Peter. *PPI Pulp Pap Int* v 30 n 5 May 1988 p 59, 61-62.

## Measurements

**076053 HERE ARE FOUR STEPS TO SUPERIOR BASIS WEIGHT MEASUREMENT AND CONTROL.** With the development of successful cross-machine control, more uniform basis weight profiles place stringent requirements on basic sensors and their scanning platforms in order to realize the necessary measurement accuracy. Enhanced graphics and data presentation for maximum visibility of the process are needed as well, while new high-performance actuators and control schemes are being developed for even more precise cross-machine control of the process. Recent advantages in these four areas have resulted in higher quality paper at lower costs.

**076054 UNIFIED THEORY OF THE MECHANICAL PROPERTIES OF PAPER AND OTHER H-BOND-DOMINATED SOLIDS - PART II.** This work examines the derivation of modulus vs. apparent density relationships for ideal, isotropic papers through the use of Percolation Theory. The results of Percolation Theory are linked to the hydrogen bond theory of the structural integrity of paper through the maximum value of Young's modulus of an ideal isotropic cellulosic paper at the density of crystalline cellulose. An activity coefficient provides the linkage between the results of Percolation Theory and results for real, isotropic papers. (Edited author abstract) 8 refs.

Nissan, Alfred H. (Batten, George L. Jr.). *Tappi J* v 70 n 10 Oct 1987 p 128-131.

**076055 PREDICTING PAPER PROPERTIES DURING PRODUCTION.** If it were possible to predict the elastic modulus of paper during production it could be possible to quantify product stiffness and other performance criteria on a continuous basis. The author describes how the obstacles to the use of sheet density as a predictor of elastic modulus have been overcome. He presents equations and formulas which could provide a basis for on-machine prediction of elastic modulus of paper during production. The research work, carried out under specific conditions of web consolidation and drying, clarifies the mechanism of modulus improvement through drying restraint. (Edited author abstract) 21 refs.

Byrd, Von L. (Mead Central Research, OH, USA). *Pap Technol Ind* v 28 n 7 Oct 1987 p 654-657.

**076056 EFFECT OF TREATMENT WITH VERY DILUTE ACIDS ON THE WET TENSILE STRENGTH AND CHEMICAL PROPERTIES OF PAPER.** Filter paper was soaked in very dilute solutions of several mineral and aliphatic dicarboxylic acids and heated for various times at temperatures ranging from 100°C to 140°C. The wet strength of the paper, measured with an Instron tester using a jaw span of 15 cm, was greatly increased by these treatments. The largest increase was by nearly 1000%; this was achieved by heating with

oxalic acid at pH 2.7 for 1 h at 140°C. Increases of nearly 750% and 850% were obtained with hydrochloric and sulphuric acids, respectively, under similar conditions. The increases in wet strength have been attributed to the formation of inter-fibre cross-links. (Edited author abstract) 14 refs.

Nevell, T.P. (Univ of Manchester Inst of Science & Technology, Manchester, Engl); Nugawela, D. *Carbohydr Polym* v 7 n 3 1987 p 169-181.

**076057 ROLE OF CONTACTS BETWEEN THE FIBERS IN THE FORMATION OF THE STRENGTH OF PAPER.** The authors have determined independently the area of contact between the fibers. The independent determination of the contact area between the fibers allowed us to assess the strength due to the autohesive interaction between individual fibers ( $b_0$ ) and to identify the factors affecting the autohesion of the fibers. 4 refs.

Malinovskaya, G.K. (Leningrad Technological Inst of the Cellulose & Paper Industry, USSR); Drobosyuk, V.M.; Antonova, N.I. *Colloid J USSR* v 49 n 2 Mar-Apr 1987 p 313-314.

**076058 ON-LINE MEASUREMENT AND CONTROL OF STRENGTH PROPERTIES.** Paper strength is known to be affected by such process variables as furnish, refining, formation, pressing, and drying stresses. The relationships between these variables and product strength for a given machine can only be determined after extended observation and analysis. With the ability to measure strength on-line, an operator can track the effects of subtle changes in process variables, leading to a better understanding of how to control strength. On-line measurement of strength also provides other benefits, such as more uniform quality, reduced costs, and increased production.

Lantz, Keith G. (Measurix Corp, Cupertino, CA, USA); Chase, Lee M. *Tappi J* v 71 n 2 Feb 1988 p 75-78.

**076059 FIBER PROPERTIES AND TEARING RESISTANCE.** The effects of three principal fiber properties - length, strength, and coarseness - on the tearing resistance of paper have been studied. Experiments were carried out by varying one property at a time while keeping the others constant. The dependence of tearing resistance on fiber properties changes with the degree of sheet consolidation. In a poorly-bonded sheet, tearing resistance depends more on fiber length than on fiber strength, but the opposite is the case in a well-bonded sheet. For long, straight, and adequately bonded fibers, the tearing resistance is proportional to the square of fiber strength. This indicates that fiber strength is more important for tearing resistance than previously thought, particularly for softwood market chemical pulps. Among fibers of similar length and strength, coarser fibers make sheets with higher tearing resistance. (Author abstract) 12 refs.

Seth, R.S. (Pulp & Paper Research Inst of Canada, Pointe Claire, Que, Can); Page, D.H. *Tappi J* v 71 n 2 Feb 1988 p 103-107.

**076060 UNIFIED THEORY OF THE MECHANICAL PROPERTIES OF PAPER AND OTHER H-BOND-DOMINATED SOLIDS - PART III.** The modulus of real, isotropic paper is used to derive relationships between modulus and density for anisotropic, machine-made papers. The isotropic modulus is treated as an invariant; i.e., for a constant apparent density and an absence of changes in the furnish, the isotropic modulus is fixed. Structural theory is invoked to account for orientation effects. The resulting equations are simple products:  $E_{MD} = E_{iso} \beta_1$  and  $E_{CD} = E_{iso} \beta_2$ , where  $\beta_1$  and  $\beta_2$  are orientation factors, the forms of which are

**076047 A NEW GENERATION OF PAPER MACHINE TRIM PROGRAMS.** There are two basic approaches to solving trim problems in the paper industry: linear programming and sequential pattern generation. A new and more powerful approach combines the two methods, taking advantage of the most useful capabilities of each while eliminating the weaknesses of both. In most cases, the solution will contain patterns generated by both approaches. In the rare situation in which the problem is best solved exclusively by one method or the other, the procedure is capable of giving that type of solution as well. (Author abstract). 6 Refs.

Haessler, Robert, W. (Univ of Michigan, Ann Arbor, MI, USA). *Tappi J* v 71 n 8 Aug 1988 p 127-130.

Deinking See Also PULP MATERIALS—Waste Paper.

**076048 EVALUATION OF DEINKING PERFORMANCE: A REVIEW OF TEST METHODS.** Test methods for evaluation of deinking performance are not well defined. Standardized test methods are needed to help in assessing the efficiency of alternative deinking systems and the quality of deinked pulp. Techniques that are currently used to evaluate the deinking process include brightness improvement and ink-speck count. This article examines a variety of methods used to prepare brightness pads and discusses some of the factors that can affect pad brightness. Procedures are recommended for consideration as standardized test methods. (Author abstract) 20 refs.

McKinney, R.W.J. (PIRA, Leatherhead, Engl). *Tappi J* v 71 n 1 Jan 1988 p 129-131.

**076049 DEINKING AT PAPELERA PENINSULAR AND THE PHILOSOPHY OF DEINKING SYSTEM DESIGN.** With the adoption of an appropriate system philosophy and the selection of the right equipment and chemicals, it is possible to deink a 100% waste newsprint furnish by flotation alone and produce an excellent product at an attractive cost. The reason these studies have been successful is that we were able to use automatic image analysis techniques. In using image analysis, we were able to compile and transfer technical information not only from within the pulp and paper industry, but also from other technologies, such as mineral flotation and chemical detergent washing technology. Analysis of this knowledge has given us a fundamental technical understanding of the deinking process, which has enabled us to develop more efficient deinking units and systems. (Author abstract). 13 Refs.

#### 076061 COMPUTER SIMULATION OF THE UNIAXIAL ELASTIC-PLASTIC BEHAVIOR OF PAPER.

The elastic properties of paper materials have been predicted by a micromechanics model of a ribbon-like nonwoven structure. The present model extends the previous linear elastic theory to incorporate nonlinear elastic and deformation theory plastic behavior. The theory incorporates different nonlinear or plastic parameters of fibers that are loaded in tension and compression. The theory is used to develop a computer simulation of the uniaxial straining of a strip of paper. Theoretical results are compared with experiments conducted on two classes of paper materials. (Author abstract)

#### 076062 COMBINED EFFECT OF FIBER FINES AND DISSOLVED ORGANICS ON TISSUE PROPERTIES.

The quality of tissue is influenced by contaminants that may be present in the white water. Fines and dissolved organics are the main cause of trouble in the manufacturing process. In this work, the quantitative effect of these components on tissue properties were studied. Chemithermomechanical pulp (CTMP) fines and a mixture of xylan, lignin, and resin acid were added to bandsheet furnishes. Strength properties, absorbency rate, and formation of bandsheet were measured. Fines and organics have an impact on these properties, especially wet strength and absorbency. Resin acid and lignin are the organic contaminants responsible for the greatest effects. (Author abstract) 7 refs.

#### 076063 MECHANISM OF WET-STRENGTH DEVELOPMENT BY ALKALINE-CURING AMINO POLYMER-EPICHLOROHYDRIN RESINS.

Solubility tests of wet-strength paper in cupriethylenediamine ('cuen') have been used as a diagnostic test of the wet-strength mechanism. Tertiary amino polymer-epichlorohydrin ('epi') resins appear to insolubilize cellulose through cuen-resistant ether linkages. Secondary amino polymer resins did not insolubilize cellulose except with artificial curing. The reactivity of the functional groups of model compounds toward cellulose paralleled the insolubilization results. From electrophoretic mobility measurements and analogies with the wet- and dry-strength behavior of combinations of polyamide-epichlorohydrin (PAE) and carboxymethylcellulose, it appears that PAE resin first wet-strengthens paper by forming cuen-labile ester links with pulp carboxyl groups. Additional resin cross-links with itself instead of reacting with cellulose hydroxyls. (Author abstract) 12 refs.

Espey, Herbert H. (Hercules Inc, Wilmington, DE, USA); Rave, Terence W. *Tappi J* v 71 n 5 May 1988 p 133-137.

#### 076064 NOTE ON THE EFFECT OF FIBER STRENGTH ON THE TENSILE STRENGTH OF PAPER.

D.H. Page's equation describes quantitatively the effect of fiber tensile strength on sheet tensile strength. For strongly bonded sheets, sheet strength is approximately proportional to fiber strength. This particular prediction has never before been tested, though. The authors have now conducted an experimental check of the equation by varying the fiber strength in such a way that the other parameters are maintained constant. By weakening fibers in sheets using a vapor-phase treatment with hydrochloric acid, the fiber strength falls. The sheet tensile strength falls accordingly, exactly as the equation predicts. (Edited author abstract) 9 refs.

**Newsprint** See Also DATA PROCESSING, BUSINESS—Distribution Applications; PAPER AND PULP INDUSTRY—Marketing; PAPER AND PULP MILLS—Construction; PAPER AND PULP MILLS—Modernization; PAPERMAKING MACHINERY; PAPERMAKING MACHINERY—Canada; PAPERMAKING MACHINERY—Dryers; PAPERMAKING MACHINERY—Retrofitting; PULP MATERIALS—Kenaf.

#### 076065 IMPULSE DRYING OF NEWSPRINT.

Impulse drying, a process currently under development for drying paper in a long nip press with one heated surface, has been shown to yield superior newsprint properties with reduced energy requirements. The improvements are the result of the application of new dewatering and densification mechanisms to the drying process. Applied to newsprint, two impulse dryer nips could replace an entire cylinder drying system, while giving increases in sheet density and tensile strength of 30 to 40%. Impulse-dried sheets have excellent surface appearance and properties, including reductions in surface roughness of up to one half, and increases in water absorption time by a factor of six. Energy use is reduced in comparison with cylinder drying, as up to 50% of the water is removed as liquid. (Edited author abstract) 8 refs.

#### 076066 UPGRADING MECHANICAL PULPS BY CHEMICAL TREATMENT OF REJECTS PRIOR TO REFINING.

Groundwood rejects, TMP rejects and a mixture of groundwood rejects and shredded chips were individually treated with sodium sulfite liquor prior to refining. Newsprint from conventional (untreated rejects) and upgraded (treated rejects) furnishes were produced. Results show that the quality of newsprint from the upgraded groundwood furnish containing 33% less sulfite was comparable to newsprint from the conventional furnish, and the quality of upgraded TMP furnish was comparable to TMP containing 15% sulfite. (Author abstract) 12 refs.

#### 076067 NEWSPRINT REQUIREMENTS FOR WATER-BASED FLEXOGRAPHY, PART II: NEWS-PRINT CHEMISTRY AND WATER-BASED INKS.

Water-based inks for newsprint can be destabilized under conditions modeling newsprint chemistry. In the absence of alum, ink dispersions are stable indefinitely at a pH of 4.3 or higher. In the presence of as little as 0.5 ppm of  $Al^{+3}$ , ink dispersions will flocculate with time at any pH, and most rapidly below a pH of 5.3. Newsprint white waters and aqueous extracts from newsprints have a similar effect, except that the harmful effects of alum and low pH are mitigated by as yet unidentified newsprint components. It is suggested that ink destabilization by ions leaching from the paper into the ink at the plate/paper interface may contribute to plate fill-in in water-based flexography. (Author abstract) 14 refs.

Aspler, J.S. (PAPRICAN, Pointe Claire, Que, Can); Perreault, Z.F. *J Pulp Pap Sci* v 14 n 1 Jan 1988 p 12-16.

#### 076068 PRESSABILITY AND STRENGTH OF NEWSPRINT FURNISHES.

Newsprint has been traditionally produced from a mixture of mechanical and chemical pulp. In many mills, the proportion of the more expensive chemical pulp is determined by machine runnability, which depends on adequate web dewatering characteristics and wet-web strength. In these mills, the cost of production could be reduced if satisfactory machine efficiency could be achieved with less chemical pulp. The addition of chemical pulp of ground wood increases the strength of the wet web but does not significantly increase the solids content of pressed sheets. 12 refs.

McDonald, J.D. (Pulp & Paper Research Inst of Canada, Pointe Claire, Que, Can); Pikulik, I.I. *Tappi J* v 71 n 2 Feb 1988 p 71-74.

**076069 MAKING NEWSPRINT FROM A MODERN MIXED FURNISH.** Bridgewater is making a high quality newsprint from a mixed furnish of CTMP and DIP - deinked pulp. The two pulps complement each other, and the end product combines strength with a smooth and even surface - it has none of the problems of springiness and poor stackability that are associated with the bulky mechanical pulps. The author describes the technology that has transformed waste-based pulps so that today they are 'probably better than virgin mechanical fiber' and the properties DIP imparts - properties that have persuaded Bridgewater to move from a 35% to a 55% DIP furnish. (Edited author abstract)

Clewley, John (Bridgewater Paper Co, Engl). *Pap Technol Ind* v 29 n 1 Feb 1988 p 6-10.

#### 076070 MAKING NEWSPRINT FROM A 100% WASTE-PAPER FURNISH.

A discussion is presented of a complete revamping program that transformed the deinking plant, the pulping system, the pressure and wire section; the machine calender, the PM drive and the finishing department at the Aylesford Newsprint firm. Improvements in the press section are presented in tabular form. The final stage of the modernization program is a new drive to take the machine speed up to at least 900 meters/minute, and associated with this will be a new winder and automatic packing and handling system.

Cogger, R.C. (Aylesford Paper Mill). *Pap Technol Ind* v 29 n 2 Mar 1988 p 78-79, 82-84.

#### 076071 NEWSPRINT LOADING OF VACUUM-GEAR-EQUIPPED VESSELS.

Vacuum handling has brought major benefits, both in loading at QNS and unloading at discharge ports. Productivity has increased, costs have been reduced, and damage has dropped to half of what it used to be. 1 ref.

Caron, P.H. (Quebec & Ontario Paper Co, Baie Comeau, Que, Can). *Pulp Pap Can* v 89 n 2 Feb 1988 p 35-37.

#### 076072 GRAININESS AND FORMATION RANKING.

A representative sampling of Canadian newsprint, containing 256 specimens, was sorted into nine levels of subjective preference using the Rangefinder technique. An index of floc intensity and an index of grain size were measured on each specimen using the Paprican Microscanner. Subjective rank was found to depend upon a combination of these two mutually independent variables. (Author abstract) 3 refs.

#### 076073 ON-MACHINE STRESS-STRAIN BEHAVIOUR OF NEWSPRINT.

Dynamic tension and draw measurements in the open draw of a pilot paper machine were compared to laboratory measurements on wet, unstrained paper produced under similar machine conditions. It was found that the tensile strength of wet webs in the first open draw was lower and the elongation greater than that measured in a laboratory instrument. Thus, a lower wet-web modulus was measured on the paper machine despite the higher strain rate. It is postulated that this difference is a result of non-uniform tension applied through the thickness of the sheet as it peels from the (Author abstract) 13 refs.

McDonald, J.D. (PAPRICAN, Pointe Claire, Que, Can); Pikulik, I.I.; Daunais, R. *J Pulp Pap Sci* v 14 n 3 May 1988 p 53-58.

#### 076074 NEWSPRINT REQUIREMENTS FOR WATER-BASED FLEXOGRAPHY, PART III: INFLUENCE OF NEWSPRINT PROPERTIES ON FLEXO INK HOLDOUT.

A newsprint was calendered to various roughness levels, and was surface treated to various water absorbency levels. No correlation was found between flexo print density and water absorbency, but a correlation was found with newsprint roughness. However, for a range of commercial newsprints, the correlation between flexo print density and surface roughness was poor. These

findings are in agreement with what is commonly known for conventional oil-based inks. Print through in water-based flexography was found to depend on paper opacity, but not on pH, water absorbency, or other newsprint properties. Although evidence from newsprints that had undergone accelerated aging suggests that second impression setoff is reduced at a low newsprint pH, this cannot be resolved until water absorbency and pH effects have been separated. (Author abstract) 20 refs.

Aspler, J.S. (PAPRICAN, Pointe Claire, Que, Can). *J Pulp Pap Sci* v 14 n 3 May 1988 p 66-72.

**076075 REBUILD AT GNN BOOSTS NEWSPRINT OUTPUT, EVEN WITH SOME SHUTDOWNS.** With the modernization of newsprint machines Nos. 5 and 6 at its East Millinocket, Maine, mill, Great Northern Nekoosa Corp. was able to shut down two of four original machines without any loss in production capacity. The mill's two other original machines had been shut down prior to the recent modernization. Mill newsprint capacity with the two machines rebuilt by Beloit will be approximately 335,000 tpy, which is more than the total output from all four of the original machines. Author describes the new machines and how improvement in production and quality control were achieved by having these replacement machines.

**Nondestructive Examination** See ELECTRIC INSULATING MATERIALS—Paper.

**Opacity** See Also PAPERMAKING—Nonfibrous Materials.

**076076 POWER SERIES FOR THE EFFECT OF FORMATION ON OPACITY.** Opacity is a highly non-linear function of basis weight. Consequently, the increased opacity in the heavy regions fails to balance the loss in the light regions, causing the mean opacity to decrease in proportion to the mass non-uniformity. The net opacity can be calculated from a polynomial function of the formation index. To a good approximation, the opacity loss is proportional to the curvature of the function relating opacity to basis weight. (Author abstract) 2 refs.

**076077 EMULATING THE TAPPI DIRT COUNT WITH A MICROCOMPUTER.** Two aspects of the human visual system are emulated by a computerized dirt counter to improve agreement between visual and instrumental dirt assessment. Following Ricco's law, the integrated contrast within the speck's image is calibrated to the assessment of a 'standard observer' to account for the contrast response of the eye. Secondly, the image is sharpened with an appropriate medium-pass spatial filter to identify dirt amidst formation-related reflectance variations in the same manner as the human eye. In this way, the dirt counter can detect at least as much dirt as a person can and scale its visual impact commensurately. (Author abstract) 3 refs.

**076078 PROVEN APPROACH TO FLUORESCENT BRIGHTNESS MEASUREMENT AND CONTROL.** The most advanced approach for on-line whiteness/brightness measurement and control is the AccuRay Microscan Color/Brightness Sensor and Fluorescent Brightness Control. The most effective method of fluorescing fluorescent whitening agents (FWAs) is with a xenon lamp, as used in the Accu-Ray Microscan Color/Brightness Sensor. Xenon lamp technology for process applications, such as that found in the AccuRay sensor, makes it possible to measure a full range of color as well as fluorescent brightness by gaging the entire visible spec-

trum at discrete wavelengths, giving a total description of the white papers. The fluorescence is displayed as a delta and obtained by measuring the brightness without ultraviolet light through the use of a software-controlled UV filter and subtracting it from the brightness measured with ultraviolet light present.

**076079 CALCINED CLAY CAN IMPROVE THE PROPERTIES OF UNCOATED GROUNDWOOD PAPERS.** Manufacturers of uncoated groundwood papers have explored a number of methods to improve paper quality and acceptability with the use of filler pigments. Of the mineral fillers, calcined clays have been found to work in this application at low levels of addition (3 to 5 percent). In North America, Europe and elsewhere, calcined clays have been tested and found to provide benefits in newsprint, improved news, SC, and lightweight directory grades of paper. Some of these results are summarized here and show that calcined clays can offer improved paper quality and printability or maintain these properties while reducing basis weight. These results include: brightness; opacity; smoothness; basis weight; strength; bulk; printability; and retention. 3 Refs.

## Packaging

**076080 HIGHLY EFFICIENT CONTINUOUS COIL PACKING LINE.** A highly efficient continuous coil packing line with a new automatic paper packing system developed by SMI and Kawanozoki Inc. went into operation on the cold strip processing line at the Wakayama Steel Works in March 1987. This new system has made it possible to automate several manufacturing processes: paper supply, paper wrapping, paper folding, and taping. It is much more efficient and leads to higher quality than the conventional manual process, and it is highly flexible during operation. This report gives an outline of the continuous coil packing line, focusing primarily on the new automatic paper packing systems. (Author abstract) In Japanese. 1 ref.

**076081 STATISTICAL ANALYSIS OF CROSS-MACHINE VARIATIONS IN BASIS WEIGHT.** The author's spreadsheet is an aid to T 545, a gravimetric method for measuring basis weight profiles. The cross-direction profile is obtained when these samples are cut into sheets, conditioned, and weighed. A 100-in-wide machine will yield 180 samples for weighing and data analysis, so statistical methods are used to analyze the results. The spreadsheet performs this statistical analysis on up to 800 data points, generating a report in the form described in the test method. The spreadsheet can also be used without any modification for cross-machine profile analysis of other paper properties. (Edited author abstract).

**076086 BOND PAPER CHARACTERISTICS FOR PRINTING BY RESISTIVE RIBBON THERMAL TRANSFER.** On plain, bond papers, paper surface smoothness and chemistry are the characteristics that most affect image qualities in printing by correctable resistive ribbon thermal transfer. Sheffield smoothness of the papers correlated with 88 percent of the variability in relative print quality, with the best print quality being produced on the smoother papers. The London surface energy, which is dependent upon the surface chemistry of the papers, correlated with 82 percent of the variability in correction performance and 67 percent of the variability in abrasion resistance. Higher surface energies produced poorer correction and better abrasion resistance. The London surface energy can be measured using a gas chromatographic method. (Author abstract). 9 Refs.

**Recycling** See Also PULP MATERIALS—Waste Paper; WASTE DISPOSAL—Recycling.

**076088 POLYCHLORINATED BIPHENYLS AND HEAVY METAL LEVELS IN RECYCLED PAPER FOR HOUSEHOLD USE.** Besides polychlorinated biphenyls (PCBs), cadmium (Cd), mercury (Hg) lead (Pb) and other heavy metals from the print-inks (colors) may also be introduced to the recycled paper. The aim of the present study was to evaluate, on behalf of Danish Environmental Protection Agency, the levels of PCB's, Cd, Hg and Pb in the recycled paper for the household use. For this purpose a pilot study was undertaken for the determination of the contents of PCB's, Cd, Hg and Pb in recycled papers that were available in the Danish market.

The results of the present study indicate that the Pb content in the recycled papers is much higher than that in the non-recycled paper. Since Pb is toxic, and can be absorbed through the skin, the regulation of Pb content in recycled paper for household use must be considered. 5 refs.

**076091 BIRTH OF A FULLY AUTOMATED FOLIO SHEETER AND PACKAGING LINES.** Technology development in folio sheeting hit a virtual standstill during the 1970s. Since the early 1980s, however, significant improvements have increased machine speeds up to the 1000-ft/min range. Motorized movement of size-change parts was also introduced, followed by the development of fully automatic size changing. Evolution of backstands during this period also led to major production improvements through flying-splice or quick-splice systems. Technological advancements also brought significant improvements in control of cutoff length and better jogging and stacking. Customer acceptance improved as a result of these quality improvements in precision sheeting, and orders that formerly could only be processed by sheeting and trimming were changed to precision-sheathed tonnage.

**076092 MECHANICAL AND CHEMICAL METHODS ENHANCE TISSUE SHEET PROPERTIES.** This article reviews the mechanical means and furnished variables commonly used to achieve sheet properties. It further explores both wet end chemical additives (as well as Yankee spray boom applications) and the effects that each additive has on sheet properties. Through the use of various chemical additives such as retention/drainage polymers, dye fixatives, absorbency aids, softeners, and coating/release additives, tissue and towel manufacturers not only can make higher-quality paper but can also realize additional production benefits and cost savings such as reduction of wet and dry strength resins, increased crepe blade life, and lower furnish costs.

Novotny, Raymond J. (Nalco Chemical Co, Naperville, IL, USA). *Pulp Pap* v 62 n 8 Aug 1988 p 74-78.

**076093 SHEET RELEASE PROBLEMS INVOLVING MULTILAYER FABRICS EASILY SOLVED.** Papermaking problems are created when the sheet tail cannot be effectively blown off the fabric while threading the sheet. Additionally, the full-width sheet (at breaks) carries back with the fabric on the return run and may land in the wire pit, creating problems with consistency control. This article discusses a number of methods that have produced favorable results. Ensuring successful knockoff, and these involve: flooded nip shower; knockoff shower; wash roll doctor knockoff; inside wire return roll flooded nip.

Jones, Roy (BTR Paper Group, Wake Forest, NC, USA). *Pulp Pap* v 62 n 8 Aug 1988 p 108-110.

**076094 NEW SHEETER BOOSTS OPERATING SPEED AT CLAMPTIP PAPER BY MORE THAN 30%.** A description is presented of an MSL sheeter that has an average running speed of 450 to 550 fpm. This sheeter can produce over 50,000 lb of skidded material during an eight-hour shift. To obtain maximum running efficiency an Airfoil Overlap system was installed which provides fast sheet feeding from the cutting section to the stacker. The patented system forces the tail end of the first sheet down, while pushing the leading edge of the oncoming sheet up to provide jam-free overlapping. This feature is particularly important during operations where four webs are being cut at once due to the quantity of sheet overlapping. After material is sheeted, it is trimmed to size on one of its three guillotine trimmers.

Anon. *Pulp Pap* v 62 n 10 Oct 1988 p 100-101.

## Strain

**076095 MEASUREMENT OF STRAINS IN A PAPER TENSILE SPECIMEN USING COMPUTER VISION AND DIGITAL IMAGE CORRELATION. PART 1: DATA ACQUISITION AND IMAGE ANALYSIS SYSTEM.** An automatic data acquisition and data analysis system for the study of surface deformation in paper specimens through image analysis has been developed. The measurement method is a noncontacting whole-field method that is insensitive to typical laboratory vibrations and which has variable sensitivity that can be modified during post-processing of the data. This range in sensitivity can include the localized variability in paper specimens, or it can be employed to average out such effects and obtain the macroscopic response. (Author abstract) 8 refs.

Sutton, Michael A. (Univ of South Carolina, Columbia, SC, USA); Chao, Yuh J. *Tappi J* v 71 n 3 Mar 1988 p 173-175.

## Surface Properties

**076096 OPTICAL MEASUREMENT THROWS NEW LIGHT ON PAPER SURFACE.** The latest techniques of optical measurement are throwing new light on the surface properties of paper. And, since the printability of paper is influenced by its uniformity, levelness and smoothness, the data obtained could open the way to improved printing papers. Optical measurement is on-line, continuous and very accurate. It reveals that MD and CD samples of paper reflect incident light in different ways, possibly because surface scattering mainly occurs in the plane transverse to the fiber orientation - and the orientation distribution is normally skewed along the MD. (Author abstract) 18 refs.

Hansuebsai, A. (London Coll of Printing, Engl); Morantz, D.J. *Pap Technol Ind* v 28 n 5 Aug 1987 p 563-573.

**076097 RESPONSE OF PAPER SHEET SURFACE AREAS TO CHANGES IN RELATIVE HUMIDITY.** The inverse gas chromatographic method allows measurements of the changes in surface area of paper sheets as a function of relative humidity. Bleached kraft handsheets, formed from pulp beaten to varying degrees and dried

normally, show irreversible loss of surface area on exposure to high humidities; sheets dried free of restraint show an initial increase. The changes are attributed to a combination of fiber swelling and the relaxation of surface fibrillation generated at fiber-fiber bonds during the initial drying of the sheet. (Edited author abstract) 19 refs.

Gurnagul, N. (PAPRICAN, Pointe Claire, Que, Can); Gray, D.G. *J Pulp Pap Sci* v 13 n 5 Sep 1987 p 159-164.

## Swelling

**076098 MEASURING THE SWELLING PRESSURE OF PAPER.** A new technique measures the pressure created when water is added to dry paper sheets restrained in the z direction. Swelling curves obtained with commercial samples and with handsheets are interpreted in terms of fiber wall swelling, fiber shape recovery, and internal flow. Fiber wall swelling is the primary process in chemical pulp fibers, while the fiber shape recovery process predominates in mechanical pulp fibers. Internal flow results from the plasticizing effect of water, which causes the collapse of the paper structure. Swelling pressure develops rapidly and was measurable in less than 1 s. Consequently, water molecules diffuse into the cell wall much faster than is usually assumed. There is an excellent relationship between the irreversible increase in thickness upon redrying and the increase in surface roughness. (Author abstract) 8 refs.

Skowronski, J. (PAPRICAN, Pointe Claire, Que, Can); Lepoutre, P.; Richard, W. *Tappi J* v 71 n 7 Jul 1988 p 125-129.

## Testing

**076099 SHEFFIELD UNIT UPDATE TO TODAY'S TECHNOLOGY.** Recent developments in the measurement of gas flow rate should make it possible to modify a Sheffield tester so that it can be adapted for use within an automated data-collection system. The experimental work and development of instrument is described. The variables in the Sheffield smoothness test are discussed. A comparison is made with other air-leak smoothness testers. The results of the trials are summarized. Sheffield tubes calibrated in the appropriate units indicate a linear response to changes in flow rate as measured in SLPm (standard liters per minute). The linear response of each tube is different. The differences are consistent between mill units manufactured or recalibrated at various times and histories. Discontinuity points exist between flows measured at equal Sheffield units from the top of the lower flow tube to the bottom of the next higher flow tube.

**076100 CORRELATING THE ON-LINE MEASUREMENT OF ULTRASONIC VELOCITY WITH STRENGTH PROPERTIES.** During the past two years, five generations of ultrasonic-based strength sensors have been tested on a state-of-the-art corrugating medium machine at Nekoosa Packaging, Tomahawk, Wis. Projected velocity accuracies are better than 1%. Excellent correlation between the square of the ultrasound velocity and either STFI compression strength or tensile strength ( $r=0.995$  in both cases) has been demonstrated using samples taken during an extensive rush-drag trial at the mill. Good correlation between CD ring crush and ultrasound velocity is also obtained when both MD and CD velocities are combined. Accurate prediction of results for the flat crush test requires that both MD velocity and sheet caliper be taken into account. The continuous monitoring possible with an on-line sensor has shown some unanticipated stiffness variations during the rush-drag trial that may ultimately lead to new understanding of the process. (Author abstract) 9 refs.

**076101 MEASUREMENT OF STRAINS IN A PAPER TENSILE SPECIMEN USING COMPUTER VISION AND DIGITAL IMAGE CORRELATION.** An automatic data acquisition and data analysis system for the study of surface deformation in paper specimens through image analysis has been developed. It has been used successfully to study the in-plane deformations in a uniaxial test coupon of paper. The method was also used to determine the displacement field in the gauge region. Both local variations and the microscopic paper response may be obtained from the experimental data. Finally, the technique may also be applied to the determination of a deformation field on the microscale. (Author abstract) 2 refs.

Chao, Yuh J. (Univ of South Carolina, Columbia, SC, USA); Sutton, Michael A. *Tappi J* v 71 n 4 Apr 1988 p 153-156.

**076102 EVALUATING SYNTHETIC FORMING FABRIC TRIALS.** It is imperative to quantify the results whenever a fabric trial is undertaken. In order to do this in an orderly fashion, it is recommended that a 'needs analysis' and test plan be developed to organize the trial and quantify the gains. A detailed approach to fabric trials and a typical test plan format includes: the objective statement; success criteria; abort criteria; potential problem analysis; data collection; data evaluation; quantitative/qualitative evaluation.

**Ultrasonic Effects** See PAPERBOARDS—Ultrasonic Effects.

## Wetting

**076103 ULTRASONIC TECHNIQUE TO STUDY WETTING AND LIQUID PENETRATION OF PAPER.** A new ultrasonic apparatus was designed to study wetting and liquid penetration of paper. The apparatus can measure both fast and slow transient changes in ultrasonic attenuation by a sheet of paper touched by a rising surface of test liquid pumped into the measuring cell. Test with water showed the time dependence of attenuation, varying with different degrees of sizing of the paper sample. The fast change shows a good correlation with the Bristow absorption test and can be related to the wetting delay of the paper surface. The slow change was interpreted as caused by liquid penetration into the bulk pores of paper sheets. (Author abstract) 17 refs.

## X-Ray Analysis

**076104 SOFT X-RAY IMAGING CAN BE USED TO ASSESS SHEET FORMATION AND QUALITY.** Low-energy (< 10 keV) x-ray radiography can be used to assess formation with a spatial resolution on the order of one fiber diameter. Digital image processing can be used to quantify mass and floc size distribution through histogram analysis and two-dimensional Fast Fourier Transforms, respectively. Superior speed and resolution may be achieved via optical image processing techniques. In addition, formation can be assessed independently of sheet color, stickies and other contaminants are easily quantified, and the quality of internal layers in multilayer sheets can be assessed. (Author abstract) 2 refs.

**076107 TECHNOECONOMIC TRENDS FAVOURING INCREASED ELECTRICAL DEMAND BY THE PULP AND PAPER INDUSTRY - A STATUS REPORT.** The purpose of this report is to analyze, and project to the mid-1990's, the impact of new pulping and papermaking process technology on incremental electrical energy demand by Canada's pulp and paper industry. Continuing efforts and technological development to enhance this industry's competitive position have favoured increased consumption of electrical energy per tonne of product. The trend towards higher specific electrical energy consumption should continue in the foreseeable future. 21 refs.

## Computer Applications

**076108 WESTRAK PUTS WESTVACO CORP. ON CUSTOMER SERVICE FAST-TRACK.** From the receiving dock to the press room to the shipping platform and everywhere in between, electronic data transmission has swept the graphics industry. The benefits of this kind of record-keeping are steadily giving the competitive edge to those who not only have it, but also know how to put it to work for them. The program is a joint development

of the Graphic Communications Association and the American Paper Institute. It has the support of many paper companies in the United States and Canada. The first implementation of the system was accomplished by Westvaco Corp. through its WesTrak system.

Horton, Virgil (Westvaco Corp). *PIMA Mag* v 69 n 3 Mar 1987 p 19-21.

## Computer Simulation

**076109 DYNAMIC PROCESS SIMULATION IMPROVES PROJECT DESIGN, TRAINING, OPERATION.** Of particular interest to an integrated engineering and construction company and its clients is the use of dynamic process analysis by simulation. This article discusses how dynamic process simulation can be utilized from the ground floor (engineering design) of a project through commissioning (test bed and training applications) to operation (utilization in advanced control).

## Europe

**076112 CMEA AIMS TO OPEN FOREST RESERVES.** The developments plans of the CMEA group of eastern European countries are described. Priorities include the expansion of existing mills and the exploitation of vast forests in the USSR. CMEA countries' growing stock and forest areas are summarized. The prognosis for the year 2000, prepared four years ago, predicts present output levels will rise by 50%, which means a total paper production of 21-22 million tons/yr. It is likely, however, that this will not cover demand in 2000. New capacity for most of the countries involves the enlargement of existing mills. In the USSR there are two main directions for development: opening so far unexploited forest areas in the European region; bringing certain transsiberian regions into production. New mills covering the demands of more member countries are to be built with common finance, technology and manpower.

Vamos, Georg. *PPI Pulp Pap Int* v 29 n 7 Jul 1987 p 56-58.

Finland See CHEMICAL INDUSTRY—Energy Utilization.

## Health Hazards

**076113 CANCER INCIDENCE OF WORKERS IN THE FINNISH PULP AND PAPER INDUSTRY.** The cancer incidence of 3 545 workers in the Finnish pulp and paper industry was assessed in a retrospective cohort study. Among the men, 196 cases of primary cancer were detected versus 203.8 expected [standardized incidence ratio (SIR) 96, 95% confidence interval (95% CI) 82 - 114], and there were 47 cancer cases among the women versus 57.9 expected (SIR 91, 95% CI - 108). Lung cancer occurred in 78 men (62.6 expected, SIR 125, 95% CI 98 - 155), and the excess was the most prominent for the male board mill workers (40 observed, 18.1 expected, SIR 222, 95% CI 158 - 302), particularly after 20 years' latency (25 observed, 7.8 expected, SIR 323, 95% CI 209 - 476). Analogous excesses of lung cancer occurred among the men (especially the male board mill workers) who began work after 1 January 1945. The findings were not explained by smoking habits. ## India

**076114 ENERGY CONSERVATION AT BHADRACHALAM PAPER BOARDS LTD.** M/s. Bhadrachalam Paper Board Limited (BPL) was established in 1979 as an integrated pulp and paper plant. The primary energy need of the plant is in the form of steam and electricity. Coal is used for steam generation and the high pressure steam also generates captive power of 4.5 Mw before it is utilized to meet other needs. As a result of the measures taken specific energy consumption per tonne of paper production was brought down from 9.35 tonnes of steam and 1550 KWH of electricity in 1981, to the level of 8.6 tonnes of steam and 1480 KWH of electricity in 1985. The major areas of improvement have been modifications in the chipper house, stationary side hill screen system optimum utilization of the blow heat recovery system and vacuum pumps in the paper machines. Concerted efforts have also been made for electricity and water savings. Some of the measures undertaken by the company are discussed.

## Machinery

**076115 PGW UPDATE: SEVENTEEN MILLS NOW USE THE PROCESS TO PRODUCE 5,500 TPD.** The pressurized grinding process has progressed very rapidly from its initial development to widespread acceptance and application. Pressurized groundwood (PGW) is used in all major paper grades that contain mechanical pulp, with the majority going into SC and LWC. The excellent printing properties of groundwood are maintained. Together with reduced share of chemical pulp in the paper furnish, PGW pulp provides a high-quality sheet for printing, especially with lightweight paper grades. The PGW and its advantages are described in this article.

Anon. *Pulp Pap* v 62 n 6 Jun 1988 p 114-117.

## Maintenance

**076116 1987 MAINTENANCE CONFERENCE.** This conference proceedings contains 29 papers discussing several aspects related to maintenance practices in the paper and pulp industry. Topics covered include: selecting a computerized maintenance management program; role of software in predictive maintenance; lubrication practice in Canadian pulp and paper mills; fire research; bearing failures; vibration prevention methods; and analysis of paper machine suction shells. All of the papers are in English except one which is in French. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11283 in the Ei

## Marketing

**076117 UNCOATED MECHANICAL PULP PRINTING SPECIALTIES: MARKET, MANUFACTURE, QUALITY.** Major reasons for the Canadian newsprint industry's increasing trend towards higher value printing grades are analyzed. These reasons include relatively high manufacturing costs with the exception of energy, out-dated equipment, the need to strengthen the industry's competitive position, plus a rapidly growing and readily accessible U.S. market. **Planning** See PAPER AND PULP MILLS—Quality Control; RIVER BASIN PROJECTS—Management.

## Quality Control

**076119 QUALITY MOTIVATES AN INCREASING NUMBER OF FORMING FABRIC TRIALS.** It is paramount for the future health of the North American paper industry that it continually improve its competitive position. In order to accomplish this, paper machine clothing trials must be considered. If they are undertaken, a thorough test plan will ensure that an accurate evaluation can be made, thus enabling all participants to reach logical conclusions about the trials. Papermakers as well as clothing suppliers must keep in mind that the paper-making process is intricate and that the value-added aspect of paper machine clothing will continue to be a major factor in the competitive marketplace throughout the 1990s. Customers' demands for quality are motivating an increasing number of machine clothing trials. Author discusses the criteria for conducting the machine clothing trials.

## Reliability

**076120 RELIABILITY ANALYSIS OF THE FEEDING SYSTEM IN THE PAPER INDUSTRY.** The paper discusses the performance of a feeding system in a paper mill having five units. Out of these, three are working almost on the same pattern, while the working of the other two is different. Reliability and availability function and mean time to failure (MTTF) of this system are calculated. (Edited author abstract) 3 refs.

**076122 BOWATER ADDS CATAWBA LWC PM.** The new 8.5-m wide fourdrinier paper mill (PM) 2 at Bowater Carolina's Catawba mill is described. Although its ultimate purpose was to add 177,000 tons/yr of lightweight coated (LWC) paper capacity, the \$423-million investment at Catawba mill included much more than just the new Beloit PM 2 and its off-machine coater, supercalenders and winders. Three separate projects were completed, the LWC line, three thermomechanical pulp (TMP) lines, a new woodyard, extra kraft pulp capacity and other equipment. This report concentrates on the PM, its coater, and the finishing department.

Smith, Kenneth. *PPI Pulp Pap Int* v 29 n 7 Jul 1987 p 54-55.

**076123 WRAPPING LINE SEALS INVESTMENT.** As part of the same investment program that included the new 220,000-ton/yr PM 1, the Parenco newsprint mill has added a roll handling and wrapping line capable of processing the entire output of the mill. When PM 1 is fully on stream, that will amount to 400,000 tons/yr of standard and improved newsprint grades. The roll handling and wrapping system is complex. And as a prelude to the whole investment, the mill exchanged its Omega computer for a new Vax mill computer system, to allow efficient tracking and controlling of the new production, which will include several soft-calendered, improved news-print grades.

Pearson, John. *PPI Pulp Pap Int* v 29 n 11 Nov 1987 p 51, 53.

**076124 FROM PAPER TO REAM TO BOX TO PALLET.** Bowater's New Thames mill has rebuilt its PM 6 machine extensively in 1984. New lines started up in 1985, and 30,000 tons/year of A4 and A3 papers are being produced. Also, more than 2,500 tons/year of folio papers are converted. Reels coming off the 125,000-ton/yr 6.8-m trim PM 6 enter the converting house, which is adjacent to the end of the machine.

Sutton, Peter. *PPI Pulp Pap Int* v 29 n 11 Nov 1987 p 57, 59, 61.

**076125 SHEETERS HANDLE 350,000 TONS/YR.** Nordland Papier's Dorpen mill in West Germany has one of the largest sheeter installations in Europe. Dorpen mill has three paper machines. All are twin-wire units supplied by Valmet. PM 1 was installed in 1969 and rebuilt in 1984. It is 4.5 m wide and has a maximum operational speed of 750 m/min. It makes the heavier-weight grades, ranging from 80 to 250 g/m<sup>2</sup>. For the production of larger formats, the mill uses six Jagenberg Synchro sheeters ranging from 1.6-2.15 m wide. The latest was installed this year.

Pappens, Rita. *PPI Pulp Pap Int* v 29 n 11 Nov 1987 p 65, 67.

**076126 LAJA MILL INVESTS FOR THE YEAR 2000.** Procel is the name of a \$40-million investment program at CMPC's Laja mill, aimed at increasing

capacity and raising efficiency to keep the mill competitive well into the future. In this article the author reports how CMPC's Laja mill in Chile raised market pulp output.

Vila, Juan (Eurocan Pulp & Paper, Can). *PPI Pulp Pap Int* v 30 n 6 Jun 1988 p 65, 67.

**076127 UPGRADED CTMP MILL PRODUCES EXTRA TONNAGE WITH RELIABILITY, QUALITY.** Powell River, B.C., has installed the first chemi-thermomechanical pulp (CTMP) line on the North American West Coast and now is one of the largest and most productive CTMP lines. The steps that helped it achieve high reliability and quality of product are described. The tight scheduling, woodroom and steam plant improvements, and high quality pulp production are discussed.

## Automation

**076128 NIAGARA PAPER MILL MOVES TO 'AUTOMATED QUALITY MANAGEMENT'.** The Niagara Millwide Quality Management Program is one of the many quality assurance/improvement efforts being initiated by paper mill management throughout North America. Niagara's program involves extensive SPC training, participative management and the employment of the new RoboTest technology to provide timely, accurate and useful quality information throughout the mill.

Anon. *PIMA Mag* v 69 n 10 Oct 1987 p 23-26.

**076129 STRUCTURED APPROACH TO MILLWIDE AUTOMATION.** The mill automation plan approach has been found useful in defining an overall approach to millwide automation. It has been applied both to new mills and also to retrofits into existing mills. In the latter case the existing control systems have been overlaid onto the data flow diagrams before the new alternatives have been explored. The definitions of local and global data bases have also been defined with this method. The structure of data bases is an important element of millwide and should be analyzed carefully. 2 refs.

Fadum, Ole-Kristian (Fadum Enterprises Inc, Westwood, MA, USA). *Process Technol: A Compil of Rec Eng Conf Pap on Process Control and Simul* Publ by TAPPI Press, Atlanta, GA, USA, 1985 p 9-13.

**076130 BEFORE YOU AUTOMATE.** Before you automate, understand your corporate objectives, define and analyze your mill requirements, and then plan your millwide solution. Because of the complexity of the issues involved, as well as the large number of possible solutions and offerings available on the market today, there is no simple answer to millwide automation. This paper addresses some of the issues and poses some questions for discussion. An evolutionary approach to millwide automation based on an evaluation of current and future requirements is proposed. (Author abstract) 14 refs.

Kallos, Steven E. (Foxboro Co, Foxboro, MA, USA); Sawyer, Raymond D. *Process Technol: A Compil of Rec Eng Conf Pap on Process Control and Simul* Publ by TAPPI Press, Atlanta, GA, USA, 1985 p 29-33.

**076131 TALE OF TWO TOWNS.** The article presents a comparison of two companies' methods of installing automation and provides an instruction scenario as to such a system implementation. Both cases are real. Waterton believed in the maxim that 'people would support what they helped to create'. Lufton practiced 'mushroom management' - keep people in the dark and tell them only what they need to know. Both companies faced early choices - they could either manage by fear or manage by trust.

Spiker, Barry K. (Honeywell Industrial Automation Systems Div, Phoenix, AZ, USA). *Manuf Syst* v 6 n 1 Jan 1988 p 25-29.

**076132 FLOW PROBLEMS SOLVED AT NEWS-PRINT MILL USING VENTURI-ELEMENT METER.** Measuring dryer condensate flows at Great Northern Paper required instrumentation capable of withstanding high vibration and noise. As part of this new system, Great Northern installed two venturi-cone primary flow elements to achieve the rangeability and the accuracy required in the updated process. In the system, steam condensate from six separate dryer sections is directed by two 2-in. lines through a vacuum receiver pump. These lines carry the condensate to a vent condenser and back to the boiler, where steam is generated. Precise measurement of flow in this area is critical to papermaking.

Royek, Steve (Ametek Inc, Paoli, PA, USA). *Pulp Pap* v 62 n 9 Sep 1988 p 216-217.

**076133 MASS FLOW METER INSTALLATION AIDS ALKALINE SWITCH AT FINE PAPER MILL.** A case story is described where a six-machine, 550-tpd fine paper mill switched from acid to alkaline papermaking. This required more attention to wet end chemistry. The new complexity of the additive process coupled with a general need to exert tighter control on flow rates led to an evaluation of the Smith S-Mass Coriolis mass meter. The twin S tubes are vibrated at their natural frequency. As fluid flows through the tubes, their displacement relative to each other becomes slightly distorted. The resultant phase shift in the output signals from motion sensors A and B is directly proportional to the mass flow rate. S-mass meter testing program and applications are described. The meter proved to be very accurate. Greater accuracy in flow measurement and more precise control can have a significant impact on machine productivity and profitability.

Butler, Ernest L.; Anderson, Donald P. *Pulp Pap* v 62 n 9 Sep 1988 p 224-226.

**076134 MILL MANAGEMENT'S ROLE IN MILLWIDE AUTOMATION.** It is argued that mill and production managers in the USA have generally been slow to take the appropriate leadership role in defining, justifying and introducing millwide systems planning in their companies. Increasingly, the impediments to efficient investment and implementation of applied technology are seen in cost accounting, management and planning. A simple general model of the use of computers in industry is developed. It consists of three systems: data processing (DP), management information systems (MIS) and applied technology (AP). Their integration is discussed. A true millwide system defined by all of these classes of systems activity can be considered as the horizontal integration of the process control systems, and the vertical integration of these process control systems with conventional management information systems.

Routledge, Thomas C. (H.A. Simons Ltd, Vancouver, BC, Can). *PIMA Mag* v 70 n 10 Oct 1988 p 17-20.

## Auxiliary Equipment

**076135 RECONDITIONING BEATS REPLACEMENT.** Bark presses are subject to severe wear during operations. In this article the author describes how replacement of moving components and a change in frame design can save money and extend press life.

Klang, Hakan. *PPI Pulp Pap Int* v 30 n 6 Jun 1988 p 91.

**Boilers** See Also BOILER CONTROL—Water Level; BOILERS—Efficiency; BOILERS—Waste Heat Utilization; BOILERS—Water Tube; PULP MANUFACTURE—Waste Liquor Utilization.

**076136 PROTECTING YOUR RECOVERY BOILER FROM PMS AND OTHER SORDID CRITTERS.** The author examines the problem of water circuits contamination of the recovery boiler. He points to the pulp mill as the main cause. He suggests the use of the following tools to minimize the problem: sample coolers;

monitoring techniques such as conductivity turbidimetry, membrane filters; warning systems for utilities/personnel; effective condensate corrosion treatment program.

Levine, Gerald (Betz Industrial). *PIMA Mag* v 69 n 7 Jul 1987 p 35-37.

**076137 AIR JETS AND MIXING IN KRAFT RECOVERY BOILERS.** This paper examines several aspects of single and multiple air-jet systems typical of those used in recovery boilers. We first review the extensive work involving the trajectory and penetration for air jets in crossflow in a wide variety of applications, including combustion furnaces. We next discuss the dominant influence of the interaction of multiple jets. This interaction dramatically changes the determination of jet penetration in a boiler furnace. Flow channeling is seen to be a prominent feature of furnace air flows and is shown to influence mixing, combustion, and char entrainment in recovery-boiler furnaces. Finally, some general guidelines for design of recovery-boiler air systems are presented. (Author abstract) 22 refs.

Adams, Terry N. *Tappi J* v 71 n 1 Jan 1988 p 97-100.

**076138 KRAFT RECOVERY BOILER: CONVENTIONAL TO LOW ODOR CONVERSION.** Reduced emissions, reduced energy costs and reduced maintenance costs are the objectives of a recovery boiler low odor conversion. The project affects a number of process streams in several mill areas and presents some options. Exploring the options may uncover additional energy savings that will improve the return on investment (ROI) (Author abstract) 1 ref.

Hein, A.G. (H.A. Simons Ltd, Vancouver, BC, Can). *Pulp Pap Can* v 88 n 12 Dec 1987 p 223-226.

**076139 40-YEAR FIGHT AGAINST CORROSION IN KRAFT RECOVERY BOILERS: A REVIEW.** Recovery boilers of the Tomlinson concept have been used in Sweden since 1936. Increasing dimensions, higher pressures, elevated temperatures and higher capacities have caused increasing corrosion problems. Considerable effort has been made in Scandinavia to reduce the fireside corrosion. Fundamental research was conducted in the 60s. Composite tubes were introduced in the 70s. However, recovery boilers still have corrosion problems. This paper reviews Swedish experience on recovery boiler corrosion, during the last four decades. (Author abstract) 14 refs.

Ingevald, S. (AF-IPK, Stockholm, Swed); Bruno, F.; Ekqvist, F. *Pulp Pap Can* v 88 n 12 Dec 1987 p 250-255.

**076140 RETROFITS: WHERE THE ACTION IS.** Retrofitting, rather than building new recovery boilers, has become the major business of some manufacturers. There are two main factors responsible for this development, one economic, the other technical. The economic impetus is the capital cost of new recovery boilers, which has become so high that it is difficult to justify a new unit to obtain additional capacity or to replace an obsolete, inefficient unit. While not applicable to all boilers, it is clear that there is a substantial reservoir of untapped capacity in existing recovery boilers that could handle much of the anticipated expansion in kraft pumping in the near term.

Grace, Thomas M. (Inst of Paper Chemistry). *PIMA Mag* v 69 n 12 Dec 1987 p 57-58.

**076141 SINTERING OF FIRESIDE DEPOSITS AND ITS IMPACT ON PLUGGING IN KRAFT RECOVERY BOILERS.** The paper first examines the results of laboratory and field studies of the sintering characteristics of deposits and precipitator dusts collected from various recovery boilers. Then the effect of sintering on the boiler plugging is explored. Sintering of deposits

and dust begins at temperatures as low as 300°C. In the range of 500°C to 600°C, deposits sinter rapidly, reaching a maximum strength in less than 1 hour. 5 refs.

**076142 EXTRACTING THE LAST TON OF CAPACITY.** Technical ingenuity has raised Cenibra's market pulp capacity in the last 10 years from 265,000 to 350,000 tons/yr. Now the mill situated near Inatinga in Minas Gerais State of Brazil is implementing a plan to double its capacity to 700,000 t/yr by the early 1990s. The pulp is produced from eucalyptus trees. The equipment's process and economics of production are described. Energy saving and effluent treatment is also discussed.

**076143 COMPUTER CAN BE A TECHNOLOGICAL MINEFIELD.** Mills can make costly mistakes when investing in computers. The mill must define exactly what it wants of a computer - what the problems are - before deciding on a system. And, it is vital that the right personnel be allocated to this task. This introduction to computer technology is designed for the non-expert, it points out some of the dangers in the minefield. (Edited author abstract) 5 refs.

**Computer Simulation**

**076145 ROLES FOR MICROCOMPUTERS IN APPLICATIONS OF MASSBAL TO LARGE AND SMALL PROCESS SYSTEMS.** SACDA's MASSBAL program was originally developed for mainframe use. It has been successfully implemented on minicomputers, and recently it has been installed on a microcomputer. We describe our implementation experience, and our discovery of some eye-opening facts about microcomputer software. Based on our experience, we envisage a number of applications of microcomputers for engineering purposes. Local computing power greatly reduces the requirement for costly timesharing facilities. Software for microcomputer poses a number of difficulties. These problems include security for the software, and a fair return for software developers. Despite the many engineering tasks that micros can accomplish, there are limitations. Some of the current limitations and deficiencies are outlined, which it is hoped will be overcome by future hardware and software releases. (Edited author abstract) 1 ref.

**Concrete Construction**

**076147 MASSIVE FOUNDATIONS FOR AYRSHIRE PAPER MILL.** The building is made up of a precast portal frame sitting on in situ pile caps, columns and beams. Cladding consists of precast panels, six metres wide and two-and-a-half metres deep. Main roof beams weigh twenty-eight tonnes, and are twenty-seven metres long. The operating floor of the mill will be seven metres above the ground floor, to suit the installation of machinery which has to be deeply seated in its foundations. Pile caps of various shapes and sizes support the outside of the building and internal columns, and these caps are linked with ground beams.

**Construction** See Also CONSTRUCTION INDUSTRY—Management.

**076148 IT'S BOOM TIME FOR ALBERTA'S BURGEOING PULP AND PAPER INDUSTRY.** With one mill soon to be opened, the large expansion of an existing one, and the announcement of the construction of two more, the province is becoming a major player in the Canadian pulp and paper industry. The soon-to-be-opened market pulp mill belongs to Millar Western pulp Ltd. Champion Forest Products in Hinton announced it would be doubling capacity to 385,000 t/y of pulp in a \$361-million project. Daishowa Canada Co. Ltd. announced plans for a \$500-million market pulp mill, in Peace River. The biggest news is the announcement of the construction of Alberta's first paper mill. The Alberta Newsprint Company Ltd. will build a 220,000-t/y mill near Whitecourt.

**076149 MILLION-TON MILL MOVES CLOSER.** The author reports from Brazil on the start of work on Aracruz's second eucalyptus pulp line. On completion of the 525,000-ton/yr installation, mill capacity will rise to one million tons/yr. (Edited author abstract)

Knight, Patrick. *PPI Pulp Pap Int* v 30 n 4 Apr 1988 p 55, 57-58.

**Control** See Also CONTROL SYSTEMS—Performance.

**076150 LAYING THE FOUNDATIONS OF MILL-WIDE CONTROL.** The New Thames Mill took a first step towards mill-wide control with the installation of a dual coaxial highway and a distributed control system in 1984. A new module was plugged in to extend control to the wet end in 1985; and future modules will bring finishing and conversion into a mill-wide system. The system is easy to use and mill staff can change and develop control loops. It has proved 100% reliable, and the mill has achieved precise control over the furnish and reduced energy consumption, broke, time loss and off specification paper. (Author abstract)

**076151 CONTROLLERS KEEP FLEXIBILITY HIGH, OPERATING COSTS LOW AT PULP MILL.** The Leaf River Forest Products pulp mill in New Augusta, Mississippi can process up to 697,000 cords of wood per year, yielding 367,000 tons of fully bleached hardwood and softened kraft pulp. Leaf River has five operating areas - the woodyard, digester/bleach plant, pulp machine, powerhouse, and wastewater treatment

facility - each of which is supervised by an Allen-Bradley PLC-3 programmable controller with hot back-up. The controllers supervise a number of smaller programmable controllers. An A-B Data Highway lets the controllers 'talk' to each other and to the mill's color graphics operator interface system, linking the five areas into a mill-wide distributed control system.

**076153 SPECIFIC ENERGY CONTROL OF SCMP REFINERS AT NBIP.** The SCMP plant is controlled by a Foxboro Videospec/Microspec system and a Fox 300 supervisory computer. A feed forward equation of specific energy versus primary freeness set point is used to determine the primary refiner motor loads and the primary freeness signal is fed back to adjust the equation if freeness drifts from set point. A similar closed loop is used for the secondary refiners except that here there is the benefit of feeding forward the actual primary freeness signal. Refiner throughput is measured by calibrated metering belts and adjusted for press inlet consistency. (Edited author abstract) 2 refs.

**076155 PAPER-MILL-WIDE SYSTEM DESIGN FROM THE USER'S VIEWPOINT.** The paper-mill-wide needs for process and production control and information are analyzed and synthesized in the context of a typical, rather common type of mill. It was found that the 'Williams' type hierarchy provides a convenient framework for structuring of the present state of the art in paper-mill-wide systems and an extension to 'business-wide' systems is proposed. Some measurement and control problems, unique to paper-making, are reviewed in the mill-wide context. Several options for implementation, including 'customized standard application modules', are briefly reviewed. (Author abstract) 13 refs.

**076157 ADVANCED ANALYSIS METHODS FOR USE IN THE DESIGN OF MORE EFFECTIVE CONTROL SYSTEMS IN THE PROCESS INDUSTRY.** Optimization of plant operation in industrial applications is a complex task. In most instances, the optimization is to be performed with respect to cost, usually in the form of increasing the product per-unit cost. Thus, the optimization procedure is concerned with increasing the efficiency of (1) plant management (i.e., scheduling, etc.), and (2) plant operation. This paper discusses a specific set of software analysis tools that can be used very effectively to increase productivity of plant operation. The discussion contains a brief introduction to some of the current control needs in the pulp and paper industry. Also presented is a description of the software tools, current applications of these tools in the aerospace and heating, ventilation, and air conditioning industries and potential use of these tools in the pulp and paper industry. (Author abstract) 14 refs.

## Corrosion Protection

**076163 BRINGING EXPERTISE TO THE SITE.** One technique employed to control corrosion is electrochemical control. Corrosion Service Co. Ltd., Downsview, Ont., not only offers the service to the pulp and paper industry, it has developed support systems that detect corrosion automatically from its office near Toronto. The firm claims to be one of only two in the world which provide such a service; its competitor is a smaller, Finnish company. Using electrical measurement techniques, Corrosion Service can determine if a vessel is corroding. The company offers two monitoring systems: a computer communications unit (CCU), and a remote monitoring unit (RMU).

Karl, Wayne. *Pulp Pap J* v 40 n 9 Nov 1987 p 19, 36.

**076164 ELECTRONIC CORROSION PROTECTION THROUGH THE USE OF A CONTROLLED ENVIRONMENT MODULE (CEM).** With the pulp and paper industry's growing reliance upon sophisticated process control equipment for production optimization, new techniques of control room design and construction which effectively reduce the potential of corrosion-induced equipment failure are of prime importance. To meet this challenge Circul-Aire Inc. has developed a prefabricated self-contained controlled environment module (CEM) enclosure system. This paper presents examples of potential applications of CEM's and describes the system concept and its development. (Author abstract)

**076166 TREATMENT AND ENERGY RECOVERY - AN INTEGRATED APPROACH FOR SMALL PAPER MILL WASTE SLUDGE.** Waste sludge generated during the manufacture of paper in small scale units producing 5-30 tons per day of paper, poses handling and disposal problems. This sludge along with two other major solid wastes viz., undersize feed and coal fines can be made into briquettes with readily utilizable fuel value. Waste sludge, undersize feed and coal fines registered calorific values of 2500, 3500 and 9000 kcal/kg respectively. Coal fines were found to be less reactive than the other two components. A treatment train consisting of settling, sludge conditioning with cationic polyelectrolyte of d-glucose amine type, and mechanical dewatering by vacuum filtration usually furnished a sludge cake of 20-30% solids consistency at an optimum polyelectrolyte dose of 7 mg/l. Various combinations of these waste solids were used to determine calorific values. Concentrated black liquor can be used as binder for briquettes. (Author abstract) 22 refs.

**076172 START-UP OF AN UPFLOW ANAEROBIC SLUDGE BLANKET REACTOR FOR TREATING THERMOMECHANICAL PULPING EFFLUENTS.** The start-up of upflow anaerobic sludge blanket reactors for treating thermomechanical pulping (TMP) wastewater was studied. Three laboratory scale reactors were inoculated with different amounts of sludges originating from a conventional anaerobic digester batch-fed with TMP wastewater and sludge from a municipal digester. The effects of a small amount of pulverized peat coke in the seed sludge was examined. The reactor seeded with the highest amount of sludge was most resistant to sludge washout and retained a greater amount of sludge than the other reactors. The addition of peat coke was not found to facilitate the start-up. There were no remarkable differences in specific sludge activities between the three reactors. It was observed that feed interruptions of several hours disturbed the process and delayed the start-up. (Author abstract) 14 refs.

Rintala, Jukka (Tampere Univ of Technology, Tampere, Finl). *Aqua Fenn* v 17 n 2 1987 p 221-230.

**076173 LOWER COSTS ENCOURAGE MILL INTEREST.** Since the early 1980s, interest has been growing in the paper industry in the use of anaerobic systems for treatment of wastewater from pulp and paper mills. Today, there are at least 20 systems working in the industry and several more are at the pilot stage or about to be implemented. Anaerobic treatment plants basically convert dissolved organic waste present in mill effluent into biogas, which consists of a high proportion of methane and which can be burned in the mill as an energy source. The article reports on some mills investing in such installations and the results obtained.

Pearson, John. *PPI Pulp Pap Int* v 30 n 3 Mar 1988 p 28-30.

**076174 BAIENFURT INVESTS IN THE ENVIRONMENT.** Steady investment in environmental protection procedures has made Feldmuehle's Baienfurt mill a showcase for the West German pulp industry. In the past two and a half years, the mill has invested DM 11 million (\$7 million) in a program aimed at cutting emissions from its 30,000-ton/yr sulfite pulp line. The program has tackled three major areas of concern: pollution by organo-halogens (especially organo-chlorine compounds and other organic compounds (COD) in the mill's wastewater and the emission of sulfur dioxide. In addition, measures have been taken to improve the cleanliness of wastewater before it is returned to the river.

Pearson, John. *PPI Pulp Pap Int* v 30 n 3 Mar 1988 p 31-32.

**076175 ANAEROBIC PILOT PLANT EXPERIENCE AT CONSOLIDATED-BATHURST INC.** Three anaerobic processes to treat combined NSSC-CTMP effluents were being operated on a pilot scale at the

Consolidated-Bathurst Inc. mill at Bathurst, N.B., Canada. These processes included stirred contact, upflow anaerobic sludge blanket (UASB), and two-stage fluidized bed systems. Representative contaminated mill effluent collection and delivery to the pilot units is described, as well as the pilot plant set-up and monitoring program. Operating experience during the first 100 days is discussed. (Edited author abstract). 3 Refs.

**076176 EFFECTS OF PULP AND PAPER MILL EFFLUENTS ON COASTAL FISH COMMUNITIES IN THE GULF OF BOTHNIA, BALTIC SEA.** This article summarizes effects on littoral fish community structure in nine polluted areas in the Gulf of Bothnia. Gill net catches were dominated by perch, roach and ruffe. Catches of roach and ruffe increased in the vicinity of pulp and paper mills, regardless of the production process of the mill. Catches of perch did not change significantly. These changes in abundance are qualitatively similar to those associated with eutrophication and the mechanisms involved are probably the same, since both kinds of pollution increase the organic loading in the receiving area. No diet effect that could explain species distribution was observed. (Edited author abstract) 28 refs.

Hansson, Sture. *Ambio* v 16 n 6 1987 p 344-348.

**076177 EFFLUENT FLOWMETER CALIBRATION USING FLUORESCENT DYE TRACER.** Rhodamine WT fluorescent dye tracer and a fluorometer have proven useful in flow measurements of paper mill effluents. Examples illustrate their use in continuous and discrete sampling modes. Although clays in the effluent have not interfered with tests, notable dye instability has been encountered in bleached kraft mill and wet debarking effluents. (Author abstract) 8 refs.

**076179 NATURE AND PROPERTIES OF SOME CHLORINATED, LIPOPHILIC, ORGANIC COMPOUNDS IN SPENT LIQUORS FROM PULP BLEACHING. 1. LIQUORS FROM CONVENTIONAL BLEACHING OF SOFTWOOD KRAFT PULP.** A sample of spent chlorination liquor from the bleaching of softwood kraft pulp was fractionated to isolate the chlorinated lipophilic compounds. These were investigated by gas chromatography and gas chromatography/mass spectrometry, and a number were identified as chlorinated diones and enol lactones. The compounds were found to be weakly mutagenic and to have limited potential for bioaccumulation. Quantities ranged from < 1 to 72 g/ton of pulp. At pH 7 and room temperature, these compounds were found to be relatively unstable and to decompose. (Author abstract) 22 refs.

McKague, A. Bruce (Swedish Pulp & Paper Research Inst, Stockholm, Swed); Kolar, Marie-Claude; Kringstad, Knut P. *Environ Sci Technol* v 22 n 5 May 1988 p 523-526.

**076180 IMPACT OF BLEACHED KRAFT MILL EFFLUENTS ON DRINKING WATER QUALITY.** Bleaching effluents from kraft pulp mills contain large quantities of chlorinated organic compounds, some of which are mutagenic. Mutagenic chloro-organic compounds are also formed as by-products in chlorination of drinking water. The work reported here was a combined field and laboratory study aimed at comparing the evidence of health risks from pulp mill contaminants in drinking water, with corresponding evidence from normal, chlorine disinfection by-products. The study was performed in a Swedish river basin with a large, public water works located downstream from a bleached kraft mill. Chemical analyses (gas chromatography and determination of adsorbable organic halogen) and bioassays for mutagenic activity (bacterial and mammalian cell bioassays) were performed on samples of river water, drinking water and laboratory produced drinking water. (Edited author abstract). 45 Refs.

**076181 KRAFT MILL BLEACH PLANT EFFLUENTS: RECENT DEVELOPMENTS AIMED AT DECREASING THEIR ENVIRONMENTAL IMPACT, PART 1.** Much work has been conducted to demonstrate new ways to decrease the formation of chlorinated organic compounds during bleaching. The authors review this research, the characteristics of bleach plant effluents, and the current effluent treatment methods. The formation of chlorinated organic compounds may be decreased by three basic methods. Part 1 covers the first two methods. The first is to remove more lignin during pulping by extending the pulping reaction, leaving less lignin to react with chlorine in the first bleaching stage. The second method is oxygen delignification, which is commercially practiced and may be employed to remove as much as 50 percent of the lignin prior to chlorination. (Edited author abstract). 48 Refs.

#### Environmental Impact

**076184 STOCK PREPARATION ENERGY-SAVING MEASURES PRODUCE RAPID PAYBACK. PUMPS AND REFINERS ARE THE LARGEST ENERGY CONSUMERS IN A TYPICAL PAPER MILL: OPERATING AT THE HIGHEST EFFICIENCIES IS IMPERATIVE.** The article discusses energy savings potentials in pulping; cleaning and screening; fractionation; refining; storage and mixing; wastepaper washing and pumps. Many of the measures described require considerable investments, while others can be adopted at no significant expense. These improvements are, however, often the result of detailed engineering studies. By integrating the three aspects of technological requirements, energy-saving measures, and operational reliability and flexibility an optimum plant design concept will result. In many cases, simple measures can bring considerable savings without high investments.

Kohrs, M. (Sulzer Escher Wyss GmbH, Ravensburg, West Ger); Strobel, S.; Siewert, W.H. *Pulp Pap* v 62 n 4 Apr 1988 p 49-52.

**076185 METHODOLOGY AND APPROACH FOR UNDERSTANDING AND OPTIMIZING EXISTING PLANT THERMAL CYCLES.** When evaluating an existing plant's thermal cycle, it is important to understand how the plant actually performs under different production conditions. Operating conditions are affected by the type of pulp and paper products being manufactured, the type of fuels being consumed, the cost of purchased power, and the impact of seasonal variations. This paper presents a methodology and approach that has been used successfully to optimize energy usage and to reduce operating costs in existing plants. Each plant has a unique set of operating conditions, equipment configurations, fuel contracts, and power contracts. These factors require individual analysis to determine potential savings on a case-by-case basis.

**Energy Management** See Also ENERGY MANAGEMENT—Finland.

**076186 INCREASED PRODUCTION - DECREASED ENERGY CONSUMPTION.** A complete energy audit of the St. Jerome mill was carried out with the program based on: Installation of an energy-management system. Flash steam recuperation at the paper machine condensate tanks. Control of building heating and ventilating systems. Modification of process-air systems. White water recirculation and process water heating. The installation of two boilers lowered energy costs. Closely documented project objectives and close follow-up after the system's start-up permitted to achieve savings. 3 Refs.

Goulet, J.-P. (Rolland Inc, St. Jerome, Que, Can); Lapointe, M. *Pulp Pap Can* v 89 n 6 Jun 1988 p 111-114.

**Energy Utilization** See Also ENERGY CONSERVATION.

**076187 OPTIMIZING THE YIELD FROM EXISTING HYDRO-ELECTRIC GENERATING FACILITIES.** The increasing cost of electrical energy emphasizes the value of examining existing hydro-electric installations for opportunities to increase the energy production from such facilities. With energy representing between 10% and 30% of the total cost in the production of paper optimization, the sourcing of energy is particularly important to the paper industry. This paper examines opportunities for increased power generation at a number of facilities with the conclusion that most hydro-units that have not been upgraded during the past 30 years offer substantial opportunities for increased energy production with attractive pay back periods. (Author abstract)

**076188 SIDESTREAM OXYGENATION OF THE CAPE FEAR RIVER.** Results from operating and evaluating the 5000-lb/day sidestream oxygenation system showed that sidestream oxygenation is a feasible approach for upgrading the quality of the receiving stream. At the design feed rate of 550 lb of O<sub>2</sub>/h, the sidestream oxygen transfer efficiency increased from 83% to 90% after the drilled pipe sparger was replaced with an oxygen diffuser. Sidestream oxygen transfer efficiency decreased from 99% to 83% as the oxygen feed concentration increased from 77mg/L to 228 mg/L. Sidestream oxygen transfer efficiency increased from 42% at 9 s of retention time to 83% at 53 s of retention time at the design feed rate. Efficiency increased from 81% at 75 psig to 88% at 110 psig. Eductors that angled downward at 22° reduced oxygen losses from turbulence at the river surface and improved the mixing of the sidestream with the river. River survey results showed that the present oxygenation system increases the river's dissolved oxygen by approximately 0.5 mg/L but does not have sufficient capacity to raise the dissolved oxygen at the sag point to 5 mg/L. Analysis of the river upstream of the mill showed that the BOD load in the river is almost equal to and sometimes greater than the BOD discharged at the mill site. Empirical calculations showed that the total oxygen utilized in the river correlates better with the total BOD in the river than with the BOD discharged by our mill alone.

Daniels, Douglas L. (Federal Paper Board Co, Riegelwood, NC, USA). *Tappi J* v 70 n 11 Nov 1987 p 107-110.

**076189 TEN TIPS FOR THE INDUSTRY ON HOW TO AVOID ENVIRONMENTAL PROBLEMS.** The recently enacted Clean Water Act and dioxin furor require mills to be more vigilant in monitoring antipollution programs. The truth is that a company can get in trouble over something as seemingly small as improper disposal of a cleaning solvent. Smart mill managers avoid the trap with a systematic preventive approach to complying with environmental laws. Ten basic tips to help mills tackle the job of meeting waste disposal, clean air, and clean water rules are given. These include: environmental manager; training; policies; purchasing review; paper trail; spot checking; landfill review; environmental audit and declaration of responsibility.

Berge, Vanessa Mullins (Wyatt, Tarrant & Combs, Frankfurt, KY, USA). *Pulp Pap* v 62 n 4 Apr 1988 p 53-54.

**076190 PREDICTION OF SUCTION ROLL PERFORMANCE IN PAPER MAKING.** Suction rolls are used to extract water from paper during paper making by applying a vacuum to the paper web as it passes over the roll surface. Suction rolls have frequently suffered from cracking during service, apparently as a result of corrosion fatigue processes. The search continues for improved suction roll alloys with greater resistance to corrosion fatigue. Previous laboratory tests to measure the corrosion and cracking resistance of candidate alloys have not always displayed good correlations with the performance of these alloys in service. The need for more relevant laboratory tests to predict the service performance of suction rolls is discussed in light of the demands of suction roll applications. Near-threshold fatigue crack growth testing has been conducted on superior and inferior suction roll alloys to determine whether these tests offer better agreement with service performance. A correlation was found between service performance and near-threshold fatigue crack behavior in dilute chloride solutions under conditions of high tensile mean stress. (Author abstract) 15 refs.

**076192 UPGRADING THE COMBUSTION SYSTEM OF A 1956-VINTAGE RECOVERY STEAM GENERATOR.** The upgraded steam generator has demonstrated a 60% increase in steam production over nameplate rating, a 20% increase in liquor processing capability, a 200% increase in operational on-line time between dry cleaning, and a 99% reduction in TRS emissions. (Author abstract)

Fridley, M.W. (Mid America Packaging, Pine Bluff, AR, USA); Barsin, J.A. *Tappi J* v 71 n 3 Mar 1988 p 63-69.

**076193 APM TAKES NEW VIEW OF FINISHING FLOW.** Confronted by a complex web of problems at its Petrie mill, Australia's largest paper manufacturer, APM, has adopted an innovative approach to board finish. As part of a program which will eventually cut order-to-delivery times from 4-6 to two weeks, the mill has effectively separated its papermaking operations from the finishing department. Output from the PM is stored as coreless jumbo rolls in a new 10,000-m<sup>2</sup> warehouse. Collapsible shafts are used to move the rolls to the finishing department machinery. The seven collapsible series 750 leaf-type shafts supplied by Tidland Corp., USA, are central to the scheme. They have a face width of 3.5 m, a diameter of 600 mm and weight three tons each. They are believed to be the largest in operation in the world's paper industry. Without them, the whole philosophy behind a \$20-million plus investment at Petrie over the last 18 months would be unworkable.

Bayliss, Martin. *PPI Pulp Pap Int* v 29 n 11 Nov 1987 p 72-73.

**076194 GEARED MOTORS WITHSTAND TOUGH OPERATING CONDITIONS.** Geared motors provide the required speeds at the point of application without the need to interpose further speed reduction components. They are consequently coming into wider use, especially where a high degree of Ingress Protection (IP code) is specified so that they can be installed in the most exposed positions. Good geared motor units thus offer not only above-average motor efficiencies but also a favorable gearing efficiency which, with present technology, cannot be improved upon in series production. Even with right-angled drives, which, due to space limitations, are often unavoidable, the bevel gear units that are available enable good efficiency to be obtained in comparison with the worm driven which are frequently used for the purpose. Steps in the range of speeds are discussed. Factors relating to noise levels are outlined. Corrosion protection, mechanical braking and real-lubrication intervals are examined from the viewpoint of maximizing equipment operating life.

#### Finland

**076195 DID YOU SAY WOODFREE LWCT?** To help cut postal costs of paper for direct mail houses, Tervakoski mill of Finland has rebuilt a large 4.5-m trim PM 12 during 1984-1985. Only the wire section was left from the original unit. The majority of the new equipment was supplied by Ahlstrom, including the press and dryer sections, and a modified size press, which is used for application of coatings. A new machine calendar, from

Hunt & Moscrop, was also installed. Burned lime, which is converted into precipitated calcium carbonate (PCC), is used as a filler material and also as a coating ingredient. The lime is converted at a plant on the mill site, which is Europe's first on-site PCC unit at a mill. The success of Tervakoski with the production of thin printing papers using the new PM owes itself very much to the use of chalk to preserve opacity.

O'Brian, Hugh. *PPI Pulp Pap Int* v 29 n 11 Nov 1987 p 80-81.

## Flexible Manufacturing Systems

**076196 CONSTRUCTION OF WORLD'S MOST ADVANCED BLEACHED CTMP MILL IS ON TRACK.** The mill's major process equipment include: 60-inch, 12,000 hp refiners, pressurized screens, cleaners and disc filters, twin-roll presses, hydraulic drives for dewatering presses, flash dryers, finishing line with slab/bale presses. The extremely flexible facility will operate as a specialty pulp mill, making a wide variety of grades to meet the individual technical requirements of tissue/towel, printing and writing papers and paperboard manufacturers. The new mill's process control system will consist of a Bailey Control Network 90 distributed control system and General Electric Series 6 Genius programmable controllers.

Anon. *PIMA Mag* v 69 n 8 Aug 1987 p 34-35.

## Flow Sheets

**076197 INTERACTIVE MICROCOMPUTER FLOWSHEET CALCULATIONS.** The computer program FlowCalc is a modular simulation software package designed to run on a personal computer. It combines the interactive editing, graphic, and spreadsheet-like input/output capabilities of microcomputers with the modeling and simulation capabilities of modular simulation software. This program, coupled with the low cost and fast response of dedicated microcomputers, allows process simulation to be more readily available throughout the industry to engineering and technical professionals. The context for microcomputer flowsheet calculations and process simulation is discussed, leading to the specification of appropriate hardware and software tools for implementation on microcomputer. (Edited author abstract) 21 refs.

## Gas Turbines

**076198 AERO-DERIVATIVE GAS TURBINES GAINING INDUSTRY FAVOR.** Aero-derivative gas turbines have their place in the paper industry. Their high efficiency, reliability, availability and good maintainability, coupled with the added flexibility of Stream Injected Gas Turbines (STIG) cycles, can offer a good fit with the power and steam requirements of many paper mills. Cogeneration systems based on aero-derivatives can help the paper industry maintain its outstanding record of energy management and its lessening dependence on fossil fuels through the efficiency advantages such systems provide.

Brown, R.M. (GE); Gray, R.H. *PIMA Mag* v 69 n 7 Jul 1987 p 17-21.

**076199 GAS TURBINES SUPPLY ENERGY NEEDS IN PAPER INDUSTRY.** Three total energy applications involving Ruston gas turbines have recently been detailed, two of these being cogeneration installations and the third a combined-cycle set. All are in the U.K. paper industry. A Ruston Tornado is the prime mover in a new cogeneration (CHP) plant installed at the Burneside, Kendal, plant of James Cropper plc, the specialist paper maker. The total investment here amounts to £2.75 M, and has been made in response to a changing heat-to-power balance. The new RGT gas-turbine set will

enable Cropper to meet all its electricity needs in-house, and enable the company to sell power to the national grid.

Anon. *Diesel Gas Turbine Worldwide* v 20 n 5 Jun 1988 p 15-16.

## Health Hazards

**076200 LOW HEALTH RISK SEEN FOR DIOXIN IN PAPER PRODUCTS.** The chemical 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) and 2,3,7,8-tetrachlorodibenzofuran (TCDF) are formed as trace contaminants in paper mills during bleaching of kraft pulps with chlorine and chlorine derivatives to make white products. The bleaching process varies among mills, producing varying TCDD and TCDF levels. In a study of seven pulps, for example, TCDD levels ranged from nondetectable (below the detection limit of 1.0 ppt) to 51 ppt, with a median of 4.9 ppt. Study finds skin exposure to TCDD in paper goods to be far below hazardous levels; work is under way on paper dust, food packaging.

Instruments See DRYING—Measurements.

## Korea

**076201 MAKING THE MOST OF BEING THE NEWEST.** Korea's biggest papermaker, Kye Sung, runs the most modern mill. It makes woodfree papers, coated and uncoated. Like others, it has been enjoying higher export sales, specially to the USA. (Author abstract)

Sutton, Peter. *PPI Pulp Pap Int* v 30 n 4 Apr 1988 p 49-51.

## Machinery

**076202 KERWIN PAPER'S NO. 1 PAPER MACHINE REBUILD INCREASES PRODUCTION 45%.** The author describes how the production on a 62-year old specialty paper machine has increased 45% with a new conventional press with blind-drilled rubber-covered roll. The dryer siphoning technique was changed to rotary siphoning which afforded a 10% drying increase.

Anon. *Pulp Pap* v 62 n 6 Jun 1988 p 94-95.

**076203 GILMAN PAPER ADDS Eo BLEACH STAGE AS FIRST PHASE OF PLANT EXPANSION.** Gilman Paper Co., St. Marys, Ga., started up an oxygen extraction stage in September 1987, which has resulted in a CE(OH)DED bleaching sequence. The success of this Eo stage has been shown by a reduction in bleaching costs as well as by lower shive content in the bleached pulp. Gilman is currently installing equipment to split the 600-tpd plant into two 500-tpd bleach plants with a planned startup of both plants by July 1988. Addition of the bleach stage has allowed an existing five-stage sequence to be split into two three-stage lines, thus significantly increasing the production. 4 refs.

**076205 CLOTHING COMPANIES JOIN SPC TREND WITH FAST, STREAMLINED PROGRAMS.** Paper machine clothing suppliers have implemented statistical process control programs. Author describes how SPC has improved the quality of the product in the clothing companies.

Ferguson, Kelly H. (Pulp & Paper, San Francisco, CA,

USA). *Pulp Pap* v 62 n 5 May 1988 p 46-50.

**076206 REPAP BEGINS MAJOR COATED FREE-SHEET CAPACITY EXPANSION AT MIDTEC.** Midtec Paper Corp., a Repap Enterprises Corp. Inc. affiliate, is currently building the most advanced coated free-sheet papermaking complex in the world at its Kimberly, Wis., site. The 205,000-tpy facility will cost upwards of \$250 million, and it will create 100,000 tons of incremental coated free-sheet capacity. Author describes the papermaking complex including forming, pressing, drying, coating, supercalendering, process control system, construction schedule and coating preparation as well as how the increase in productivity is attained in the plant.

Patrick, Ken (Pulp & Paper, San Francisco, CA, USA). *Pulp Pap* v 62 n 5 May 1988 p 86-90.

Maintenance See Also MAINTENANCE—Computer Applications; WINDING MACHINES—Vibrations.

**076207 MAINTENANCE PERFORMANCE EVALUATION: A FOLLOW-UP REPORT.** The Maintenance Performance Evaluation (MPE) exposes a cross-section of mill management/staff, production and maintenance personnel to 400 desirable standards of performance. These personnel, who range from managers to hourly employees, compared the standards with their views on the degree to which their mills met each standard. The results are processed to yield composite scores on each standard so that the mill can set aside those aspects which it performs well while focusing on those which need improvement.

Anon (Paul D. Tomlinson Associates Inc). *PIMA Mag* v 69 n 8 Aug 1987 p 38-41.

**076208 SETTING UP AND OPERATING A COST-EFFECTIVE PREDICTIVE MAINTENANCE PROGRAM AT CHAMPION PAPER COMPANY.** The article briefly describes a maintenance program at the Champion Paper Company plant in Quinnesec, Michigan. The predictive maintenance program currently monitors approximately 6,600 points. Some of the units covered are the pulp machine, pulp mills, boilers and woodyard area.

Anon. *Pract Lubr Maint* v 10 n 3 Sep 1987 p 19-20.

**076209 MEETING THE MAINTENANCE CHALLENGE.** As Canadian mills produce record quantities of pulp and paper, maintenance managers face more pressure to keep things running smoothly. This report, prepared from discussions at the CPPA maintenance conference in Saint John, N.B. in October and from other research, looks at some of the problems and possible solutions.

Karl, Wayne. *Pulp Pap J* v 40 n 9 Nov 1987 p 26-27.

**076210 RESULTS ORIENTED MAINTENANCE: THE FUTURE PRODUCTIVITY FACTOR.** In a study of 130 Swedish pulp and paper mills, the author found that the number of mills had decreased more than 31% in the last 15 years. During the same period, the number of hourly operators decreased by more than 18%, while the number of hourly maintenance personnel decreased by only 3.5%. Fifteen years ago, about 26% of all hourly employees were maintenance personnel. Today, that average is about 31%. In many mills, maintenance employees comprise more than half the payroll. In a highly-automated future mill, maintenance people may comprise 70 to 80% of the total mill payroll. Productivity will depend more on reliable and maintainable equipment and efficient maintenance than on efficient operations.

Idhammar, Christer (PBI Maintenance Inc, Raleigh, NC, USA). *PIMA Mag* v 69 n 12 Dec 1987 p 30-33.

**076211 WHERE SCAN AND US MILLS EXCEL.** This article summarizes the author's maintenance philosophy and how this applies to Scandinavian and US pulp

and paper industries, based upon the author's 20 years of experience as a maintenance management consultant in Scandinavia and North America. (Author abstract)

Idhammar, Christer. *PPI Pulp Pap Int* v 30 n 4 Apr 1988 p 41-44, 54.

**076212 PREVENTION IS BETTER THAN CURE.** A PPI survey of 15 EEC paper mills in the newsprint, printings/ writings and packaging sectors, showed that most were either using or planning to implement a preventive maintenance program. (Author abstract)

Pearson, John. *PPI Pulp Pap Int* v 30 n 4 Apr 1988 p 46-48.

**076213 MAINTENANCE SYSTEMS - A CRITICAL CHOICE.** A predictive maintenance programme is developed which is based on the principle that 'the operator is responsible for every aspect of production including the well-being of his equipment'. This concept depends on multi-skilling, or cross-crafting. Over a three year period, the in-house maintenance programme has reduced downtime, increased output, and enabled the paper mill to put in a more consistent performance. At the same time, outside contracting was reduced and labour productivity improved. A mill can achieve this structure through a maintenance management system. The software gives the maintenance crews easy access to the information that is necessary for decision-making and efficiency. The system includes files on all the equipment in the mill.

Anon. *Pap Technol Ind* v 29 n 3 May 1988 p 91, 93.

**076214 MAINTENANCE PROCEDURES FOR COMBATING CORROSION AND BUILDUP OF DEPOSITS.** A wide variety of industrial cleaning services are available for all three major areas of a pulp and paper mill: power and steam generating equipment, pulp processing equipment, and paper making machinery. Although chemical cleaning can be offered using many different types of chemicals and processes, hydrojetting is probably the fastest and most effective method for most pulp and paper mill machinery. The maintenance, cleaning, and corrosion protection of the three types of equipment mentioned above is discussed. In particular, it is stressed that sufficient cool-down time must be allowed to prevent the molten chemical bed from overheating the cleaning solutions, thus causing severe corrosion of metal surfaces. Calcite deposits develop very rapidly in digesters that are pushed to peak production. The hotter the temperatures, the faster deposits form.

Lewis, George (Halliburton Services, Duncan, OK, USA). *Pap Trade J* v 169 n 5 May 1985 p 57-58.

**076215 1987 MAINTENANCE CONFERENCE.** This conference proceedings contains 29 papers, one of which is in French. Some of the subjects covered are maintenance of papermaking machinery, computerized maintenance management, electrochemical metallizing, vibration analysis, helium leak detection, condition monitoring, roll measurements, predictive maintenance, and nondestructive examination. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 10870 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

Anon (CPPA, Technical Section, Montreal, Que, Can). *1987 Maint Conf, St. John, NB, Can, Oct 20-22 1987* Publ by CPPA, Montreal, Que, Can, 1987 169p.

## Management

**076216 PLATFORM FOR MILLWIDE INFORMATION SYSTEMS.** In one typical installation, the system functions provide, capture, manage, and archive all relevant production information from each parent roll. The building blocks of the structure are: data acquisition; real-time database management; continuous history database management; event history database management; relational database management (optional).

Koppel, Lowell B. (Setpoint Inc, Houston, TX, USA);

Llansa, Jorge I. *Tappi J* v 71 n 6 Jun 1988 p 61-64.

**076217 HOW TO APPLY ANALYTICAL PROBLEM-SOLVING TECHNIQUES IN YOUR PAPER MILL.** Madison Paper Industries experienced a problem with the spindles on two Bruderhaus supercalenders with a screwmatic configuration for three months, and then decided to put together a team to correct the irregular nut movement on the spindles. The key points of this case study are that a multi-disciplined team (different maintenance specialties plus operations) involving interested parties (operators) used a systematic approach to solve a difficult problem. Obviously, most problems in a mill are corrected without taking the time to pull various individuals together as a team. Team problem-solving can foster better cooperation between departments, create excitement for doing the work and improve productivity.

Beary, Rodney P. (PIMA Training Inst); Bearce, Clarence J. *PIMA Mag* v 70 n 7 Jul 1988 p 8-10.

Materials See METALS TESTING—Creep.

Modernization See Also PAPERMAKING—Finishing; PAPERMAKING MACHINERY.

**076218 ROTHESAY RESPONDS TO PRESS-ROOM DEVELOPMENTS BY ADDING QUALITY.** At Rothesay Paper Ltd., Saint John, N.B., paper machine, winder and pulp facility modernizations are a direct response to growing quality requirements. Rothesay saw numerous benefits of the upgrade soon after the rebuilt machines were started up, among them improved sheet formation and reduced steam consumption.

Karl, Wayne. *Pulp Pap J* v 40 n 7 Sep 1987 p 35, 37, 39.

**076219 MODERNIZATIONS AND EXPANSIONS: ANALYZE ALL THE ALTERNATIVES BEFORE YOU PROCEED.** Modernizations and expansions are integral parts of a papermaker's job and they must be approached in a formal and professional manner, the author says. The paper takes a hard look at the considerations and limitations that are part of any major project. (Edited author abstract)

Bellafronto, Malcolm J. (Pope & Talbot Inc). *PIMA Mag* v 69 n 3 Mar 1987 p 35-38.

**076220 REED PAPER MACHINE MODERNIZATION TAKES TWO-SIDEDNESS OUT OF NEWS-PRINT.** The newspaper machines modernization of Reed Inc., Quebec Mill Division, included Bel Bond formers on all machines, Combi presses on P.M. 1 and 2 and Tri-Nip presses on P.M.3 and 4. The object of the program was newsprint quality improvement from a printability point of view. Cost competitiveness and incremental production increases were also contemplated. This program included a modernization related to improvement in working conditions, environment and energy conservation. The paper reviews various paper properties and how they were affected by Bel Bond-Combi press and Bel Bond-Tri-Nip press combinations. The program was completed in May 1986. (Author abstract)

Sarasin, A.C. (Reed Inc, Quebec City, Que, Can); Samson, G.E. *Pulp Pap Can* v 88 n 10 Oct 1987 p 75-77.

**076221 CASCADES AIMS TO MAKE PORT CARTIER THE LARGEST BCTMP MILL IN THE WORLD.** When Cascades bought the ITT mill in 1986 for \$20 million, a \$90-million program was set in to convert the sulfite mill to a bleached chemithermomechanical operation. New equipment includes seven screw presses, eight CTMP refiners, a chip handling system, astock handling system, a medium consistency stock pump, and several motors up to 30,000 hp. The revitalized systems include the bleach plant, the pulp machine, power boiler, water treatment plant, roll handling equipment, and bale finishing equipment.

Williamson, Peter N. (Pulp & Paper Canada, Westmount, Que, Can). *Pulp Pap Can* v 88 n 11 Nov 1987 p 23-25.

**076222 FALK A DRIVING FORCE BEHIND**

**BOWATER PROJECT.** When it comes to a complex process like papermaking, the important role that gear drives play can be easily overlooked. However, speed reducers and couplings are important because, together, they transmit driving forces and produce the necessary torque for turning shafts. If this function fails, the entire PM goes down. This paper reports the modernization of Bowater Carolina Co., which included besides the Falk speed reducers, development of a new woodyard, de-barking equipment, chip conveyor, kraft digesters, demineralizers, evaporators and control systems.

Anon. *PIMA Mag* v 69 n 12 Dec 1987 p 26-27.

**076223 LAKE SUPERIOR PAPER INDUSTRIES BEGINS SUPERCALENDERED PRODUCTION.** Lake Superior Paper Industries (LSPI) began producing uncoated supercalendered (SC) groundwood paper at its Duluth, Minn., greenfield mill early last November. Lake Superior Paper is a joint venture of Pentair Inc. and Minnesota Power. Built at a cost of approximately \$400 million, the mill is designed to initially produce 243,000 tpy on a single machine, and the site is laid out to accommodate two additional machines. Its entire 1988 output is already under contract, and demand for high-quality SC-A paper is so good that management is now anticipating that work on a second machine may begin as early as 1991. The article describes the modernization/expansion project and the machinery, finishing operations, pressure groundwood system, personnel hiring/training.

Smith, Kenneth E. (Pulp & Paper, San Francisco, CA, USA). *Pulp Pap* v 62 n 4 Apr 1988 p 118-123.

**076224 DAISHOWA BEGINS BUILDING C 500 MILLION DOLLARS MARKET PULP MILL IN ALBERTA.** Daishowa is involved in two joint ventures in Canada, both undergoing aggressive expansion programs. Cariboo Pulp & Paper Co is expanding capacity 55,000 metric tpy (softwood chemical market pulp) including a recovery boiler rebuild, a new pressure diffuser, a slaker, and high-density storage. At Quesnel River Pulp Co. chemithermomechanical pulp (CTMP) capacity is being increased by 50 percent with the addition of a 275-metric-tpd TMP line, Flakt dryers, and related engineering. Daishowa also agreed to purchase the assets of Reed International plc's North American Paper Group for C 565 million dollars. The acquisition gives Daishowa a foothold in the North American newsprint market with a 417,000-metric-tpy mill in Quebec City, Que. The mill also produces 35,000 metric tpy of boxboard and 20,000 metric tpy of sulfite pulp. The deal includes a packaging plant, a pigment manufacturing plant, and two lignin sulfate plants.

Ducey, Michael J. (Pulp & Paper, San Francisco, CA, USA). *Pulp Pap* v 62 n 8 Aug 1988 p 96-98.

**076225 PENSACOLA CONVERSION BRINGS MILL INTO CORPORATE MAINSTREAM.** When Champion International Corp. changed its Pensacola, Fla., kraft mill into a manufacturer of white paper, it was the single largest conversion of such a facility ever attempted. The project's centerpiece was a full rebuild of the world-class P-5, including a Beloit Bel Form top wire, new stock prep, headbox and white water installations and the addition of a size press in the rebuilt dryer section. Existing Measurex Corp. profile controls were upgraded and linked to Foxboro Videospecs. Other major additions at Pensacola included a Sunds Defibrator two-line, short-sequence bleach plant with medium-consistency oxygen delignification. Also incorporated into the change-over was a new finishing and converting operation for cut size, sheeting and variable rolls. A new participative style of management has also been introduced.

Anon. *PIMA Mag* v 70 n 9 Sep 1988 p 28-30.

**076226 PULP MILL LIME KILN IMPROVEMENT PROJECTS PRODUCE RAPID PAYBACK.** Several kiln upgrade methods are presented along with costs,

savings, and paybacks. Energy savings as high as 420,000 dollars/year can result, with paybacks as short as three months. Additional benefits include increased production and reduced maintenance costs. Savings and paybacks discussed are based on 300 tpd production, 350 days/year operation, and 2/1 million dollars Btu fuel cost.

Puhr, Francis (Francis Puhr Corp, Clearwater, FL, USA). *Pulp Pap* v 62 n 10 Oct 1988 p 154-157.

## Modification

**076227 CHAMPION UNVEILS P-5, WORLD'S LARGEST PRODUCER OF UNCOATED BLEACHED FREE-SHEET.** This paper reports the conversion of Champion International Corp's brown kraft mill to a producer of fine white paper. The conversion involved a new bleach chemical prep area. Champion installed new facilities for chemical receiving, unloading and storage, as well as a new chlorine dioxide plant.

Anon. *PIMA Mag* v 70 n 1 Jan 1988 p 19-23.

## Optimization

**076228 STUDY OF BROKE HANDLING AND WHITE WATER MANAGEMENT USING A DYNAMIC SIMULATION.** Computer process simulation is becoming widely used in the pulp and paper industry as a tool for process design and optimization. However, most of the programs available are steady-state simulators. For operator assistance and for testing possible control actions, it is important to describe the dynamics of the process. A steady-state flowsheet simulator was adapted at the Pulp and Paper Research Institute of Canada (PAPRICAN) to analyze mill-wide dynamic behavior. The model was used in an integrated TCMP-newsprint mill to evaluate different broke handling and white water management strategies. (Author abstract) 2 refs.

Croteau, A.P. (PAPRICAN, Pointe Claire, Que, Can); Roche, A.A. *Pulp Pap Can* v 88 n 11 Nov 1987 p 74-77.

**076229 OPTIMIZATION OF THE (CD) (EO) BLEACHING SEQUENCE AT CHAMPION'S QUINNESEC MILL.** The Quinnesec mill is ideal for a statistical study because its information systems provide nearly all of the data required to completely describe the bleaching process. Statistical modeling techniques are a convenient way to process the mill data to predict pulp qualities and other parameters from key operating variables. 4 refs.

Powell, David A. (Michigan Technological Univ, Houghton, MI, USA); Barna, Bruce A.; Sullivan, Pat. *Tappi J* v 71 n 6 Jun 1988 p 49-55.

Peoples Republic of China See PAPERMAKING MACHINERY—Retrofitting; PULP MATERIALS—Straw.

## Piping Systems

**076230 QUALITY STARTS WITH PIPING IN THE APPROACH FLOW SYSTEM.** The piping in the approach flow system of a paper-mill can have a big impact on paper quality. It can cause disturbance in the flow of stock - due to the position of bends and valves, for example. And this has a knock-on effect on the accuracy of the flowmeter and the consistency of the stock delivered at the making box. Flowmeters, which work well in ideal conditions, may not be accurate in a paper-mill. Correct installation and upstream piping are of the first importance. The aim of this paper is to give some ideas for the solutions of installation problems. It concentrates on the flow disturbances and on the effects of flow profiles on electromagnetic and vortex flowmeters. Some suggestions for upstream piping are made. 12 refs.

Halttunen, Jouko (Tampere Univ of Technology, Finl). *Pap Technol Ind* v 28 n 8 Nov 1987 p 682-683, 686-687, 689.

**076231 DESIGN OF ABOVEGROUND FIBERGLASS-REINFORCED PIPING SYSTEMS.** Process piping is one of the most complex and demanding systems

in a pulp and paper mill. Piping failures can produce temporary system outages or an entire plant shutdown. The design of FRP pipe is unique in the world of piping design and necessitates that certain precautions be taken in the purchase of the pipe. The author presents an overview of the general nature of problems experienced in piping systems and describes an engineering approach by which the mill engineers can best assure the success of new FRP piping systems. 5 refs.

Renoud, Winston J. (Fiberglass Structural Engineering Inc, Bellingham, WA, USA). *Tappi J* v 71 n 3 Mar 1988 p 55-59.

**076232 OPTIMUM DESIGN OF PULP STOCK PIPELINES.** Because power costs will continue to increase, perhaps even at an accelerated rate in the future, the design engineer must consider power costs as well as capital costs on any project. Optimum pipe design is based on the least sum of fixed costs and power costs. In many installations, pipe friction is responsible for a sizable portion of pumping power costs. The engineer must also consider proper design for nonplugging operation. The method presented here allows the engineer to select a pipe size from friction loss curves on which optimum flows and nonplugging flows are shown. The method applies to stocks of all consistencies and can be extended to any stock for which pipeline friction parameters are known. The curves presented at the end of this paper are for consistencies of 1.5-6.0%. 4 refs.

Laskey, H.L. (Simons-Eastern Consultants Inc, Portland, ME, USA). *Tappi J* v 71 n 6 Jun 1988 p 79-83.

## Port Cartier, Canada

**076233 CASCADES GETS SET TO START CTMP PRODUCTION AT REJUVENATED MILL.** The Port Cartier market pulp mill - a former sulfite operation mothballed in 1979 - is about to begin production again under new owner Cascades Inc. The mill is to produce 180,000 tpy of bleached chemi-thermomechanical pulp (BCTMP). Details of production plans and equipment are given.

Port Hudson, LA See PAPERMAKING MACHINERY—Felts.

## Power Supply

**076234 CROPPER UPGRADES ENERGY SYSTEM.** As part of a continuing investment program at its Burnside mill, UK specialty papermaker James Cropper has started up a gas turbine combined heat and power system. (Author abstract)

Jeffs, Eric. *PPI Pulp Pap Int* v 29 n 12 Dec 1987 p 39-41.

**076235 GAS TURBINES LEAD CHP REVIVAL.** Over the last 40 years, significant reductions have been made in the amount of energy required to make a ton of paper. This has been accompanied by a shift in the balance of energy demand from steam towards electricity. Technical developments in energy efficiency and process control have so altered the heat to power balance in the paper industry that combined heat + power systems are again viable. The article describes some current turbines.

Jeffs, Eric. *PPI Pulp Pap Int* v 30 n 3 Mar 1988 p 40-42.

**076236 PM AND POWER ADDED AT ROERMOND.** A Third Paper machine and a fourth gas turbine combined heat and power (CHP) set were the key elements in a DFI 160-million (about \$86 million), five-year investment program completed last year by Dutch producer Roermond Papier. The power plant extension was the final element of the program and started up in October of last year. The new 100,000-ton/yr PM 3 had been started up in August 1986.

Jeffs, Eric. *PPI Pulp Pap Int* v 30 n 3 Mar 1988 p 43-44, 51.

Process Control See Also CONTROL SYSTEMS, DISTRIBUTED PARAMETER; PAPERMAKING—Finishing.

## 076237 TALE OF FOUR MILLWIDE PROJECTS.

From an analysis of four millwide projects in this article, it is concluded that those projects which were based on a long-term plan came out with adaptable and maintainable systems, despite the rapid advance of technology during the lives of these projects. The millwide control encompasses regulatory, supervisory/optimization control. It is the integration of the individual process areas (e.g., digestion, recovery, stock prep, etc.) into a coordinated unit. Millwide incorporates production management and management information systems functions. In addition, millwide can also integrate features such as on-line simulation, on-line maintenance, automatic laboratory management and future items such as robotics.

Kallos, S.E. (Valmet Automation); Nieminen, P. *PIMA Mag* v 69 n 7 Jul 1987 p 29-33.

**076238 CONTROL SYSTEM PERFORMANCE MANAGEMENT: THE HUMAN FACTORS.** Not many companies in the pulp and paper industry successfully manage process control technology and achieve a marked competitive edge as a result. Control system performance directly affects product quality, yet tends naturally to decay with time, often as a result of human factors. Staffing, training, a common language, distributed knowledge, organization and motivation are the issues. Corporate culture and climate will determine how different companies cope. (Author abstract) 4 refs.

Bialkowski, W.L. (Entech Control Engineering Inc, Toronto, Ont, Can). *Pulp Pap Can* v 88 n 12 Dec 1987 p 243-248.

**076239 HOW STATISTICAL PROCESS CONTROL WORKS IN A CORRUGATED BOX PLANT.** Most of the SPC work in the corrugated industry is really a form of statistical quality assurance. This is a prerequisite to true SPC, which involves control of machine settings to reduce variation in product quality. (Author abstract) 4 refs.

Carlson, David A. (Stone Container Corp, Chicago, IL, USA). *Tappi J* v 71 n 3 Mar 1988 p 75-79.

**076240 JAMES RIVER IMPROVED PERFORMANCE, SAVES MONEY WITH ITS CORPORATE PROCESS CONTROL SYSTEM MAINTENANCE PROGRAM.** The Cascade Mill in Gorham, N.H., is the latest James River facility to subscribe to the corporation's process control system (PCS) in-house support program. Mills in Livermore Falls, Me., and Groveton, N.H., transferred maintenance responsibility from vendors to the newly formed James River Digital Field Service (DFS) organization in early 1986, and the Cascade Mill did so this past January. The James River Digital Field Service organization is responsible for hiring, training, and providing technical direction to systems technicians assigned to the three mills. Although administratively personnel report to the DFS organization, pragmatically they are part of mill technical and production teams. This relationship is viewed as essential in establishing a successful in-house program. Each mill also assigns a coordinator from its staff to work closely with DFS technicians on work assignments and communication with various mill departments involved in the maintenance effort.

Young, Jim (Tappi Journal, Norcross, GA, USA). *Tappi J* v 71 n 4 Apr 1988 p 93-96.

**076241 BLEACHING OPERATIONS ARE OPTIMIZED BY DISTRIBUTED CONTROL CAPABILITIES.** The paper mill is dependent on consistent high-quality output from the bleach plant. Using modernized control strategies and techniques, this consistency can be achieved. As a future benefit, the overall upgrade of the mill information base makes mill wide information system

tie-ins practical. Advanced graphics, intelligent alarming capabilities, and new sensors are ideal for multitude of variables that must be handled.

Roberts, Jim (American Technical Services Inc, Tucker, GA, USA); Dartt, Steve. *Pulp Pap* v 62 n 4 Apr 1988 p 165-168.

**076242 STATISTICAL PROCESS CONTROL NEEDS MANAGEMENT COMMITMENT, SUPPORT.** A company began a corporate-wide statistical process control (SPC) program at its press felt manufacturing operations. To implement the program, an in-depth seminar was held for some 30 key Scafa Group employees. The two-day training session focused on SPC mechanics and, in particular, examined specific benefits that can be expected if a company is committed to a program and willing to dedicate necessary time and resources on a daily basis.

Anon. *Pulp Pap* v 62 n 4 Apr 1988 p 178-179.

**076243 STATISTICAL PROCESS CONTROL: AN OVERVIEW OF GOALS AND IMPLEMENTATION.** Traditional approaches to quality control focus on detecting defective product that has already been produced. This approach is costly and wasteful, since defective product must be reprocessed, downgraded, or scrapped. In contrast, the emphasis of statistical process control (SPC) is in preventing the production of defective product. The SPC approach is used to reduce process variability based on the collection and analysis of process data. Unusual process variability is detected using a statistical tool called a control chart. The causes of these variations can then be identified and eliminated. The result is reduced process variability and better process performance.

O'Connell, Richard T. (Miami Univ, Oxford, OH, USA). *Tappi J* v 71 n 6 Jun 1988 p 127-132.

**076244 REPAI BUILD'S WORLD'S LARGEST COATED FREE-SHEET MILL AT MIDTEC.** The project includes one paper machine, two coaters, three supercalenders, two winders and two sheeters. The mill's components include: top wire papermaking machinery; three-nip press with a fourth independent press; two off-machine blade coaters operating in tandem, 2 coaters using applicator roll coaters with a bent blade option; 3 14-roll super calenders with chromium-plated steel rolls; Vari-Top winders; 2 precision sheeters; a Valmet Automation process control system. When the facility goes into production, it will increase Repap's total coated paper capacity to around 700,000 tpy.

Anon. *PIMA Mag* v 70 n 6 Jun 1988 p 63-68.

**076245 TECHNIQUES FOR EXPANDING THE SPHERE OF STATISTICAL PROCESS CONTROL.** As more and more North American paper companies make firm commitments to the continual pursuit of quality improvement, formal, corporate-wide systems for quality control are being instituted. The most successful of these use statistical process control (SPC) to monitor and control processes and to help attain improvements in quality and productivity. If a mill produces only a few grades, SPC may be relatively easy to use. However, when many grades are produced and these grades are changed often, the implementation of SPC can be difficult and confusing. There are workable alternatives to the standard SPC charts for mills in which the production mix makes implementation difficult. When product changes affect process variability, the use of actual minus target values, percent of target value, and Z-scores can allow breakthroughs in quality improvements. 6 Refs.

Armitage, S.J. (Nalco Chemical Co, Naperville, IL, USA); Wilharm, M.T. *Tappi J* v 71 n 7 Jul 1988 p 71-77.

**076246 QUEBEC & ONTARIO PAPER CO. CHOOSES DISTRIBUTED CONTROLS FOR FLEXIBILITY.** The company implemented the strategy in three phases: mill startup and implementation of a Provox instrumentation system from Fisher Controls (1982-1983), integration of the distributed control system (DCS) with a Hewlett Packard A900 host computer

(1985-1986), and ongoing enhancements toward the goal of a totally integrated millwide system in the 1990s. Several possible benefits persuaded the team to try distributed controls: operator effectiveness would be enhanced by the graphic CRT displays; process optimization would be possible because routine control functions would be performed by the microprocessor-based control system; smaller control rooms would be feasible; the mill's long-term competitive position could be better maintained by early adoption of flexible, advanced control technology.

Grubb, Thomas (Quebec & Ontario Paper Co, Thorold, Ont, Can). *Pulp Pap* v 62 n 8 Aug 1988 p 92-95.

**076247 MAKING CHOICES IN THE MULTI-TIERED PROCESS INSTRUMENTATION MARKET.** This article clears up some of the confusion surrounding the market for field-mounted process instrumentation and helps the user make an intelligent purchasing decision. Transmitters available today fall into three categories based on price and performance: conventional, smart, and throwaway, the price accuracy, and features of these tiers of transmitters are compared.

Bowden, Bill (Rosemount Inc, Eden Prairie, MN, USA). *Pulp Pap* v 62 n 8 Aug 1988 p 115-117.

**076248 MODULAR SIMULATOR INTERFACES TO DISTRIBUTED CONTROL FOR TRAINING.** This article demonstrates that the modular pulp and paper simulator, GEMS, can be directly used for training on a particular distributed control system. A trainer has been configured using a modular simulator (GEMS) on a PC, a standard serial interface, and the Bailey Network 90 distributed control system. The trainee uses the identical interface unit configured as it will appear when controlling the real process. The procedure by which this has been accomplished is general, and it can be adapted to other process areas. The models created for engineering analysis using PCGEMS can be altered to include dynamic process elements. The dynamic models can then be incorporated into the trainer. 2 Refs.

**Quality Control**

**076249 AVOIDING CRISES: STRATEGIC QUALITY PLANNING.** There is a list of familiar products which have something alarming in common. Foreign imports of each of these now constitute from 25% to more than 50% of the U.S. market. A major contributor to this invasion is superior quality. A model of quality trends in the West compared to Japan is preselected. The model shows that several decades ago we had clear quality superiority. By about the mid 1970s, the Japanese had closed that gap, and proceed to become superior in quality causing the 25% market loss of U.S. companies to foreign imports, mostly Japanese. An integrated approach to quality leadership, the author says, is imperative for American industry if it expects to remain competitive with Japan.

Juran, J. M. (Juran Inst Inc). *PIMA Mag* v 69 n 4 Apr 1987 p 27-30.

**076250 PLANNING FOR QUALITY... CATCHING THE 'THIRD WAVE'.** Those companies managing quality more effectively have decided that quality is a key strategic business variable and declared that the old procedures and standards of performance are simply not good enough anymore. They have established an annual quality plan in much the same manner in which they created their annual financial plan. Then a quality improvement process is set in place to meet the new levels of quality performance called for in the plan. Simply

stated, managing for quality improves quality planning, quality improvement, and quality control. This article will address the quality planning function.

Ingman, Lars C. (Robotest Corp). *Pulp Pap* v 62 n 4 Apr 1988 p 185-187.

**076251 KVARNSVEDEN IS BANKING ON QUALITY.** Stora's Kvarnsveden mill started its giant new PM 11 last month. The state-of-the-art PM, combined with high-quality pulp, allow the mill to meet the changing needs of printers. In this article the author describes the new 220,000-ton/yr news print PM at Kvarnsveden mill.

**Republic of Korea**

**076252 TAKEOVERS BOOST SHINHO'S PROSPECTS.** Shinho is a Korean paper company. Shinho is buying mills and has projects to make more woodfree, testliner and specialties. The article discusses plant facilities and production capacity.

Sutton, Peter. *PPI Pulp Pap Int* v 30 n 3 Mar 1988 p 37-38.

**Retrofitting**

**076253 NO.3 P.M. REVAMP AT GRAND FALLS: INTERFACING DIGITAL DRIVES TO EXISTING DRIVES.** During the rebuilding of PM3 at the Abitibi-Price Grand Falls, Newfoundland, Mill, three new digital drive sections were installed and married to existing Harland analogue drives. A new digital master was interfaced to both the new and old drives providing many of the features of a complete digital drive, at a considerably lower cost. (Author abstract)

Demoe, B.P. (Canadian General Electric, Peterborough, Ont, Can); Gill, D.G. *Pulp Pap Can* v 88 n 12 Dec 1987 p 165-167.

**Simulation**

**076254 SIMULATION ACCURACY - A PSYCHOLOGICAL OR NUMERIC PROBLEM.** This paper considers the accuracy requirements of process simulation. There are two types of accuracy; the first is the accuracy of the data computations such that the simulation gives the correct mathematical answer; the second is the accuracy of the data necessary to satisfy the customer (engineer, operator or manager) that the simulation results are correct and useful. It is suggested in the latter case that the most significant influences are not technical but psychological. (Author abstract)

Gordon-Clark, Matthew R. (Scott Paper Co, Philadelphia, PA, USA). *Process Technol: A Compil of Rec Eng Conf Pap on Process Control and Simul* Publ by TAPPI Press, Atlanta, GA, USA, 1985 p 91-93.

**076255 HYBRID SIMULATION - THE EFFECTIVE ALTERNATIVE.** With the ever increasing demand for improved productivity, reduced energy consumption, tighter environmental controls and upgraded safety standards it is important for the engineers, scientists and managers in the pulp and paper industry to advance their problem solving capabilities through the application of simulation tools. For those practitioners with limited access to mathematical modeling expertise and sophisticated computing facilities, the steady-state flowsheet and pseudo-dynamic simulation packages available on digital computers will provide a vast improvement over manual calculation methods. Problem solvers in the industry capable of supporting a more sophisticated hybrid simulation facility will have the ability to accurately model dynamic systems, to perform real-time analysis, and through direct 'hands-on' operator interaction with the simulation to apply the combined knowledge of experience

operations personnel and skilled technical workers to the solution of complex process and control problems. 3 refs.

Mardon, J. (OMNI Int); Gee, J.W. *Process Technol: A Compil of Rec Eng Conf Pap on Process Control and Simul Publ* by TAPPI Press, Atlanta, GA, USA, 1985 p 109-123.

## Storage

**076256 MODULAR STORAGE SAVES SPACE, HIKES EFFICIENCY AT WESTVACO.** Due to plant improvements and expansion, a mill's management agreed to use modular storage drawer cabinets. The contents from about a dozen rotobins, including hose clamps, fasteners, tools, electrical items and general consumables, were transferred to the four cabinets. Management eventually decided to transfer as many small parts as possible from shelving and rotobins to the new cabinets. Anything that would fit into a cabinet drawer would be stored that way. The conversion plan went into effect in 1984 and cabinets are currently being ordered at the rate of 18 quarterly. Today, there are 213 S-V Model 340 cabinets and 16 Model 245 cabinets in place, a total of 229. Another 18 Model 40s are on order.

Anon. *PIMA Mag* v 70 n 7 Jul 1988 p 22-24.

**Sweden** See PAPERMAKING MACHINERY—Headbox.

## Taiwan

**076257 BAN YU AIMS FOR THE MAJOR LEAGUE.** Taiwan's biggest paper mill is currently carrying out an investment plan to take capacity to 440,000 tons/yr of paper and board by the end of 1988. Two, maybe even three, new PMs, a cogeneration plant, complete replacement of its wastepaper prep. lines and more are all planned for before 1990. A wider product range, more cost-reducing automation and lower energy costs are the reasons behind its biggest-ever expansion.

Sutton, Peter. *PPI Pulp Pap Int* v 29 n 11 Nov 1987 p 76-78.

**076258 NEW MILL MEANS MORE MARKET MUSCLE.** One sign among many of the growing technical sophistication of papermaking in Taiwan is that both of the two new machines will have high-impulse presses—the first in Taiwan. The Cheng Loong mill will also have a power cogeneration plant. Cogeneration is becoming increasingly popular in an industry which uses a lot of energy in a country which has no natural energy resource.

Sutton, Peter. *PPI Pulp Pap Int* v 29 n 12 Dec 1987 p 36-38.

**The Congo** See PULP MATERIALS—Wood.

## Ventilation

**076259 EXPERIENCE PAYS WHEN DESIGNING MACHINE ROOM VENTILATION SYSTEMS.** Several different ventilation systems are required for production in a paper machine building. Each system requires a preventive maintenance program. A description of the 12 required systems is given. They are required in a typical mill producing kraft, fine paper, and newsprint; similar systems apply to tissue machines. In addition to ventilation systems required for production, paper machine buildings have other ventilation systems. These are: air makeup systems, roof heating systems, wet end false ceiling and associated exhaust systems, and general roof exhaust. Techniques for eliminating design problems are given. A list of problems and their solutions that continually occur at pulp and paper mills are outlined.

Murphy, Otis L. (Rust Int Corp, Birmingham, AL, USA). *Pulp Pap* v 62 n 10 Oct 1988 p 132-134.

**Waste Disposal** See Also BOILER FIRING—Low Grade Fuel; WATER POLLUTION—Monitoring.

**076260 HIGH-SOLIDS BLACK LIQUOR COMBUSTION: TAMPELLA'S SUPER COMBUSTION**

**SYSTEM.** A Super Combustion system capable of firing black liquor at 80% dry-solids content was tested at the Rosenlew Aittaluoto kraft pulp mill in Pori, Finland. This mill produces 80,000 tons/year of unbleached sulfate pulp. The pulp mill's boiler is illustrated. Splash-plate-type liquor guns are situated on the boiler's front and rear walls. Boiler steam capacity is 18 kg/s (142,860 lb/h) of 32-bar (435 psig) steam at 410°C (770°F). The Super Combustion system was tested with 100% of the mill's black liquor flow, and the test facility was designed accordingly. Thus, the results received from the boiler correspond to the behavior of the furnace at the higher solids content. (Edited author abstract) 1 ref.

Hytty, P.A. (Tampella Ltd, Tampere, Finl); Ojala, S.T. *Tappi J* v 71 n 1 Jan 1988 p 108-111.

**076261 SIMPSON PAPER SWITCHES TO CO<sub>2</sub> TO ELIMINATE DEPOSITS IN SEWER PIPES.** A paper-mill finds CO<sub>2</sub> addition to be an effective, economical alternative to acid for controlling and stabilizing pH levels in mill effluent. When CO<sub>2</sub> is added to an aqueous stream, such as wastewater, carbonic acid (H<sub>2</sub>CO<sub>3</sub>) is formed. This reduces pH levels and, because of other related chemical reactions, permits them to be maintained within acceptable parameters and with great stability. The method has none of the negative effects associated with the use of acid and often is more economical. It has been used for more than a year by Simpson Paper Co. at its San Gabriel Mill in Pomona, Calif. - virtually eliminating the persistent calcium carbonate buildup, corrosion, and other problems previously experienced with an acid system.

Thomas, Earl (Simpson Paper Co, Pomona, CA, USA); Chua, John. *Pulp Pap* v 62 n 4 Apr 1988 p 100-103.

**076262 REJECT HANDLING IN SECONDARY FIBER SYSTEMS.** The quantity of rejects discharged, and particularly their fiber content, varies widely from mill to mill. Some mills pay several hundred thousand dollars per year in direct hauling and landfill expenses, even ignoring indirect labor expenses by existing employees. Reject conveying and dewatering equipment can often pay for itself in a short period of time in reduced direct labor, hauling, and landfill charges. Mills with on-site burning capabilities have some additional incentive to install equipment capable of discharging dry rejects, since this greatly increases the potential BTU yield of the rejects. It is possible that fairly dry rejects could also be sold for their fuel content by mills that cannot burn them on-site.

Bliss, Terry (Black Clawson Co, Middletown, OH, USA). *Tappi J* v 71 n 6 Jun 1988 p 87-91.

**076263 AGITATION HELPS MILL RAISE STORAGE CAPACITY AND RECOVER CHEMICALS.** Simpson Paper found a unique method for recovering settled solids from a black liquor storage tank at its Pasadena, Texas, mill. Simpson decided to try mechanical agitation. A 125-hp Lightnin VS Series side-entering mixer with a 52-in. A312 impeller was selected. The mixer was angled at 5° off the centerline and 10° off the vertical to create the clockwise swirl needed to effectively free the solids. More than one year later, the mixer was removed and another hole was cut 9 ft lower. The mixer was reinstalled and the process continued. In a period of two and a half years, the level of solids dropped about 12 feet.

Ramos, J. (Simpson Paper Co, Pasadena, TX, USA). *Pulp Pap* v 62 n 8 Aug 1988 p 114.

## Waste Heat Utilization

**076264 NEW GAS TURBINE BOOSTS CHP SYSTEMS.** Berghuizer Papierfabrik in the Netherlands has boosted steam and electricity production mill by installing a new gas turbine at Waapenveld paper mill. The unit is a crucial part of a plan to raise paper output. Since the second oil crisis of 1979-80, the Dutch paper industry has installed nearly 30 small gas turbines in combined heat and power (CHP) systems to reduce energy costs and take advantage of favorable buy-back rates offered by the

public utilities for surplus power, according to nationally-agreed formulas. Most of these sets are either the 3.5-MW Centrax 350 KB5s, or the 5.7-MW Ruston Tornado. The Solar Centauf at Waapenveld, is the first example of this gas turbine in a CHP installation in Europe.

Jeffs, Eric. *PPI Pulp Pap Int* v 29 n 9 Sep 1987 p 73-74.

## Waste Utilization

**076265 CASCADES' DEINKING PLANT PRODUCING HIGH-GRADE MARKET PULP FROM WASTE.** The sixteenth mill of the dynamic Canadian company is now in full operation at Breakeyville, Que., utilizing flotation technology. Nominal capacity is 100 tpd of a 56 to 60 brightness pulp produced from magazine and newspaper waste. A second grade is made from printed kraft waste with a 75 to 83 brightness. The mill is located on the site of a former market groundwood pulp plant. Very little of the equipment from the groundwood mill has been utilized in the new operation. A major exception to this is in the sheet forming, cutting, and baling operation. The article describes the first ink removal; flotation stage; final cleaning; highly automated operation; sheeting and baling; water recycling and effluent treatment.

Evans, John C.W. (Pulp & Paper, San Francisco, CA, USA). *Pulp Pap* v 62 n 4 Apr 1988 p 55-57.

**076266 HIGH-CONSISTENCY PULPING OF BROKE, WASTEPAPER CUTS CYCLE TIME, COSTS.** A batch pulper recently developed by Black Clawson operates at consistencies of 15% or higher. Known as Hicon, the unit uses a triple-flighted turbine rotor to submerge and circulate furnish. The tub has a rounded bottom and baffles to promote a circulating action. Pulped stock is extracted through a perforated bed plate located under the rotor. Zone dilution of the stock as it is discharged lowers the consistency to a pumpable level. High-consistency batch pulpers such as the Hi-Con are mainly used in the following ways: preparing wastepaper for deinking, pulping wet strength broke (both of these use chemicals in the pulper), and pulping plastic-coated broke.

Anon. *Pulp Pap* v 62 n 4 Apr 1988 p 76.

**076267 TRIM-REMOVAL SYSTEMS.** The rate of trim production in a paper-processing plant can surge to more than ten times the average rate. This presents a substantial challenge to a trim-conveying system. In a concentrated trim-handling system where all trim is transported to a single repulper, the design trim-handling rate should not be determined based on the cumulative maximum design output of all winders. Instead, the effect of decreased paper machine speed during production of heavier paper grades should be accompanied by a proportional reduction in winder speed. The development of winders is making the conventional trim-handling system obsolete. Vacuum trim-handling systems are replacing conventional trim-conveying equipment because of their ability to increase winder speed capacity, conserve energy, and reduce noise levels.

**076268 QUANTITATIVE ANALYSIS OF LIGNOSULPHONATE USING BENZETHONIUM CHLORIDE - PRELIMINARY INVESTIGATIONS.** Hyamine-1622, or benzethonium chloride, is a high molecular mass quaternary ammonium compound normally used as a germicide. It was found that the chemical could be used to give consistent results for the determination of lignosulphonate in the effluents from a sulphite pulp mill and in the concentrates and permeates resulting from the ultrafiltration of such effluents. Details of an analytical procedure are presented. Although the initial findings appear promising they should be considered to be preliminary. (Edited author abstract) 14 refs.

**076269 REMOVAL OF ORGANIC CARBON AND CHLORINE FROM A KRAFT MILL WASTEWATER BY PRETREATMENT WITH CATALYZED OZONE AND POWDERED ACTIVATED CARBON.** The objective of this research was to explore the feasibility of applying various physical/chemical processes, including adsorption and oxidation, for removal of discrete molecular weight fractions of the organic chlorine in Kraft mill wastewater. Activated carbon, ozone, and ultraviolet (UV) light catalyzed ozone were studied individually and in combination. It was found that activated carbon treatment removed significant amounts of total organic carbon (TOC) and total organic halide (TOX). However, when adsorption was preceded by plain ozonation or UV-catalyzed ozonation, performance was further enhanced. Physical/chemical treatments produced much higher total TOC and TOX removals than the aerated stabilization basin (ASB) process currently utilized by the pulp and paper industry. Ozone treatment provided the maximum reduction in inhibitory response, as measured by both optical density and adenosine triphosphate responses at low dilutions. At higher dilutions, additional powdered activated carbon treatment enhanced performance. Physical/chemical treatment, if it precedes ASB processing, can produce a less inhibitory influent substrate. 12 refs.

**076272 WASTE REDUCTION: WASTE RESULTING FROM ERRORS\*.** An error is a judgment mistake by an individual (salesperson, order entry, supervisor, operator, etc.) who unintentionally deviates from a standard or established procedure, resulting in an economic loss to the employer. The loss may be in the form of wasted product, returned product, extra labor, extra materials, or lower product value. Waste resulting from errors can and often does represent over 30% of a plant's controllable waste. Since all plants vary in degree of training and mechanization, an attempt is made to isolate the major causes of errors in a typical corrugating plant. The article discusses the causes of order entry, supplier, scheduling, corrugator, finishing, shipping, and invoicing errors and recommends remedies for them. A preventive program is suggested.

## Water Recycling

**076273 REUSE OF KRAFT MILL SECONDARY CONDENSATES.** It is practical and possible to reuse all secondary condensates in a kraft mill, including all

digesters and evaporation-plant condensates. The most practical way to remove odors from the foul condensates is by steam stripping the odorous components prior to reuse. The cost of steam stripping can be reduced substantially by splitting the condensate streams according to their odor and their methanol content and by integrating the steam stripper in the evaporation plant. A U.S. mill has a condensate-treatment system that allows reuse of all condensates in pulp washing. The heat cost of the steam stripping is only 0.1 dollars/a.d. ton of pulp.

Water Supply See WATER FILTRATION.

## Welding

**076274 NEW METHOD FOR RENOVATION OF PULP DIGESTERS.** Technicians from Uddcomb Engineering AB have increased the resistance to corrosion of a pulp digester at the Billingsfors pulp mill tenfold, and thus saved the cost of a total rebuild. This has been accomplished by overlay-welding with stainless steel on the inner surface, using the 'Uddcomb Method'. The welding operation is performed with Avesta's type P5 alloy welding wire, which produces an acid-resistant surface. In the Swedish market alone there are nearly a hundred digesters which can be expected to require the same treatment. This paper describes Uddcomb's welding method.

Anon. *Weld Rev* v 7 n 1 Feb 1988 p 34.

## Applications

**076275 WILL SAP CUT FLUFF USAGE IN DIAPERS?** The article assesses how superabsorbents will affect fluff pulp use in hygiene absorbent products to 1990. A forecast of the change of fluff usage to 1990 is included. Hygiene absorbent products discussed are baby diapers, sanitary towels and panty shields (sanitary protection products), and adult incontinence products. SAPs, superabsorbent polymers are swellable, gel-forming substances, capable of absorbing and retaining under pressure many times their own weight in body fluids, a marginal increase of 3.5% in the total worldwide consumption of fluff pulp from 1987-90, corresponding to an average growth of just below 1%/yr.

Nordgren, Gunnar; Kaivola, Heini. *PPI Pulp Pap Int* v 29 n 8 Aug 1987 p 39-40, 47.

## Health Hazards

**076276 LOW HEALTH RISK SEEN FOR DIOXIN IN PAPER PRODUCTS.** The Environmental Protection Agency and the paper industry announced that small amounts of 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) are present in pulp, wastewater, and sludge from paper mills. Of more pressing concern to the public, TCDD also appears in paper products to which consumers are exposed daily. The American Paper Institute (API) has released a study assessing potential health risks from dermal exposure to TCDD in paper products made from bleached pulp. The study finds skin exposure to TCDD in paper goods to be far below hazardous levels; work is under way on paper dust and food packaging.

**Mechanical Properties** See PAPER—Calendering; PAPER—Sheeting.

## Nondestructive Examination

**076277 COMPUTERIZED TOMOGRAPHY OF A PAPER ROLL.** Paper rolls were analyzed nondestructively

by a computerized tomographic (CT) system. The images of cross sections of paper rolls were shown as faithfully as they were observed by cutting them. The tomographic image density (CT value) of a cut paper sheet bundle was proportional to its sheet paper density. In CD profile of CT values of paper rolls, each roll had a different CD profile. A paper roll wound at higher tension had a poor CD profile of CT values, which indicated internal stress concentrated locally in the roll. The macroscale MD profile of CT values coincided well with the basis weight profile. The long-range MD profile of CT values decreased gradually from a surface to a core of a paper roll, which indicated that internal stress decreased from the core to the surface. (Author abstract). 7 Refs.

**076278 EFFECT OF FIBROUS FINES ON TISSUE PROPERTIES.** By means of handsheet and laboratory studies, the potential impact of a fines retention strategy on the papermaking process and on finished product properties was studied. Northern softwood kraft (NSK) and CTMP fines were added to furnishes in conjunction with a retention aid. Strength properties, absorbency rate, sheet formation and drainage time of the slurry were measured. Both types of fines have adverse effects on absorbency, stiffness, and drainage time. NSK fines are more detrimental than CTMP fines on an equivalent weight basis. Use of a fines retention aid partially restores product absorbency rate. However, a negative impact on strength properties was observed. Consequently, a fines retention strategy must balance the beneficial and detrimental effects. (Author abstract) 9 refs.

**076280 COASTERS JOIN THE PAPER CHASE.** A number of operators are now successfully transporting damage-sensitive paper reels in small open hatch coasters. The ability of such ships to carry pulp and packaged timber has never been questioned, but the possibility of carrying paper efficiently has led to a recent surge of activity. One particularly successful example is Aros Line, a small Swedish operator based in the inland port of Vasteras on Lake Malaren, which has been able to expand significantly at the expense of ro-ro operators such as T or Line. Using modern West German-built box shaped vessels, Aros, which has operated a service to the UK east coast port of Goole for a number of years, and another

Swedish operator, Pal Line, stepped in to offer shippers a weekly departure at a price level 15-20 percent below the ro-ro alternative over Gothenburg.

## PAPERBOARDS

### Additives

**076281 PAPERBOARD CHEMICAL ENHANCEMENT FOR STRENGTH AND OTHER BENEFITS.** Today's marketplace for chemical additives is being influenced by a number of factors. Such factors include the need for improved fire resistance, shipping and warehousing costs, insurance costs, the conservation of fiber resources, and costs savings in added capacity in consideration of the growth in production. Processing equipment is available for the first time that obviates the limitations and inefficiencies of past production methods. The potential for this equipment is not limited to corrugated containers but can extend to a whole new arena of products. Solid fiber containers, furniture substrates, paneling, doors, wallboard, and a multitude of other paper fabrications are limited only by the user's imagination.

Walthey, G.J. (Black Clawson Co, Fulton, NY, USA). *Tappi J* v 70 n 10 Oct 1987 p 35-39.

**Corrugated** See Also CONTAINERS—Testing; PAPER AND PULP MILLS—Wastes; PAPERMAKING—Drying.

**076282 EINFLUSS DER TEMPERATUR UND DES WASSERGEHALTES AUF DIE FESTIGKEIT VON WELLPAPPE AM BEISPIEL DES KANTENSTAUCHWIDERSTANDES NACH DIN 53 149 (12/77).** [Influence of Temperature and Water Content on the Strength of Corrugated Boards using the Example of the Edge-Crush Resistance According to DIN 53 149 (12/77)]. In most cases, the strength properties of corrugated boards are only tested under one climatic condition, i.e., 23°C/50% relative humidity. For practical use of corrugated boards as packaging materials, especially for overseas transport, it is necessary, however, to know the strength behavior over a broad range of temperature and humidity. The object of this paper is to obtain data on this subject. Tests were made with four types of corrugated boards, the edge-crush resistance being chosen as the strength property. It was found that the edge-crush resistance decreases both with an increase in temperature and with an increase in water content. In the latter case there is an exception, i.e., at temperatures below 0°C the edge-crush resistance rises slightly at first and then decreases. (Edited author abstract). In German. 6 refs.

Eschke, Richard (Fachhochschule Hamburg, Hamburg, West Ger); Koehn, R. *Verpack Rundsch* v 38 n 7 Jul 1987 p 49-53.

**076283 CORRUGATOR CUT-TO-MARK SYSTEMS FOR PREPRINTED LINERBOARD.** It has only become feasible to produce preprinted linerboard in a corrugated box plant since the introduction of the direct drive corrugator cut-off knife. Although the direct drive knife improved corrugated sheet length tolerances, its real potential is its ability to cut to an input signal. The major modification to a direct drive knife to accept an input signal is the cut-to-mark electronics and software. The input signal on the preprinted linerboard is a printed registration line that is read by a cut-to-mark sensor. The mounting of the equipment is important, and there are two modes of operation: the acceptance window and pattern recognition.

**076284 TRENDS IN HIGH-SPEED SINGLE FACER DESIGN.** This generation of single facers represents an advancement in the state of the art. Qualitative and quantitative improvements in single face production have been realized. This article offers an understanding of

these design trends helpful for the corrugated converter when analyzing future equipment requirements. 3 refs.

Sofinowski, John R. (Engineering United Container Machinery Group Inc, Glen Arm, MD, USA). *Tappi J* v 70 n 10 Oct 1987 p 43-47.

**076285 RUNNABILITY AND CORRUGATING MEDIUM PROPERTIES.** Based on analysis of the stresses applied to the corrugating medium during fluting, a physically reasonable model has been developed to show how corrugating medium properties affect critical high-low and fracture speeds during corrugating. The model may also apply to strength retention. Analysis accounts for corrugating medium properties, flute geometry, and the brake tension applied to the corrugating medium. The model indicates that speeds that cause fracturing of the corrugating medium increase as the thickness and coefficient of friction of the corrugating medium decrease and as the MD tensile strength and stretch of the corrugating medium increase. Critical speeds for high-low flute formation are affected similarly. The coefficient of friction between the corrugating medium and a hot steel surface is an important property and one that is not commonly measured. (Edited author abstract) 11 refs.

Whitsitt, William J. (Inst of Paper Chemistry, Appleton, WI, USA). *Tappi J* v 70 n 10 Oct 1987 p 99-103.

**076286 VERSUCHE ZUR OPTIMIERUNG DES RILLENS VON WELLPAPPEN.** [Experiments on Optimizing the Creasing of Corrugated Board]. Owing to automation and high costs, the packaging industries are being forced to create new conditions for efficient production and finishing techniques through well-targeted research. In being the manufacture of corrugated boards this applies to almost the whole treatment subsequent to the machine. In the manufacture of corrugated boards this applies to almost the whole treatment subsequent to the machine. In this connection the creasing of corrugated boards is one of the crucial stages. Tearing inner facings, inaccurate bending edges, an excessively high erection resistance, ill effects of the compression strength of the finished boxes and other impairments of the service qualities of corrugated boards are the characteristic problems in this area. Although these difficulties have been known to the industries for decades, only a few useful investigations have been made to keep the processing problems under control. (Edited author abstract) In German. 7 refs.

Vogelpohl, H. (Technische Univ Muenchen, Freising, West Ger); Hohmann, H.J. *Verpack Rundsch* v 38 n 8 Aug 1987 p 55-66.

**076287 TOWARDS AN INTERNATIONAL STANDARD METHOD FOR THE EDGEWISE COMPRESSION TEST OF CORRUGATED BOARD.** Three factors account for the current interest in reaching international agreement on a single procedure for the edgewise compression test (ECT) of corrugated board: The recognition that the fiberboard industry needs to make better use of its resources and that this can be achieved only if corrugated board standards are based on board properties that relate to box performance. The evidence that, of the currently measured board properties, ECT has the closest relationship with box performance. The realization in the United States that the existing TAPPI method is not well suited to routine use. It is recommended that FEFCO Method No. 8, with mandatory use of a Billerud-type cutter, be adopted as the international standard method. 13 refs.

Stott, Ronald (AMCOR Research & Technology Cent, Fairfield, Aust). *Tappi J* v 71 n 1 Jan 1988 p 57-60.

**076288 TOWARDS AN INTERNATIONAL STANDARD METHOD FOR THE EDGEWISE COMPRESSION TEST OF CORRUGATED BOARD - A SECOND OPINION.** J.W. Koning, Jr. maintains that a combined board test is possible using a necked-down specimen of corrugated fiberboard and TAPPI method T 823. Unfortunately, he asserts, there is an effort to adopt

a less accurate, more expedient test as an international standard. Considering objective criteria, Koning deems unsatisfactory the method proposed by R.A. Stott. Koning details many of the problems in the proposed method and outlines the limitations of the present TAPPI method. Koning also sets forth criteria that an edgewise compression test should meet if it is to be an international standard. (Edited author abstract). 17 Refs.

Koning, John W. Jr. (Univ of Wisconsin, Madison, WI, USA). *Tappi J* v 71 n 10 Oct 1988 p 62-64.

**076289 CLAMPED SPECIMEN TESTING: A FASTER EDGEWISE CRUSH PROCEDURE.** The technology of edgewise crush test (ECT) measurements can be improved by developing a simpler, more efficient method to prepare and test the sample. A newer ECT procedure for cutting and supporting the sample has been developed which uses an unwaxed, 2×2-in. specimen. The specimen is cut with an automatic ECT cutter with two blades. The specimens are tested in a fixture that supports the ends with clamps at a controlled pressure. The fixture fits between the platens of both flexible platen and rigid-platen compression testers. No waxing of the ends is necessary. Results for the clamped-specimen procedure agree well with those of the TAPPI procedure specifying waxed ends. (Edited author abstract). 9 Refs.

Schramper, K.E. (Inst of Paper Chemistry, Appleton, WI, USA); Whitsitt, W.J. *Tappi J* v 71 n 10 Oct 1988 p 65-69.

**Manufacture** See Also COGENERATION PLANTS; PAPER AND PULP MILLS—Taiwan; PULP MANUFACTURE—Sulfite Process.

**076290 EFFECT OF PRESSING PRESSURE OF THE FIRST STAGE ON THE PROPERTIES OF RICE-STRAW HARDBOARD.** In hardboard manufacture, the wet pressing method is most commonly used - in which a three-phase pressing cycle is normally employed. The effect of variation in the pressing pressure during the first phase of this pressing cycle on the properties of rice-straw hardboard is studied. The specific pressure used in this stage is a very important factor that influences the properties of the finished hardboard. An appreciable improvement in the properties of the finished board is noticed when increasing the pressing pressure. A specific pressure of about 60 kg/cm<sup>2</sup> is sufficient to impart desirable properties to the finished board. (Author abstract) 16 refs.

Fadl, Naim A. (Nat'l Research Cent, Cairo, Egypt); El-Kalyoubi, Samira F.; Rakha, Mohamed. *Res Ind* v 32 n 2 Jun 1987 p 107-111.

**076291 HIGH-CONSISTENCY IS FINDING A ROLE.** So far, high-consistency forming has been used to make board grades of 100-300 g/m<sup>2</sup>. In this article the author reviews the way the process is used today and assesses its potential for making other grades.

Waris, Tapio (Valmet-Ahlstrom, Finl). *PPI Pulp Pap Int* v 30 n 6 Jun 1988 p 87, 89.

### Mechanical Properties

**076292 UTILIZATION OF LANTANA CAMARA FIBREBOARDS: PART-1.** Various chemical constituents, viz. extractives, pentosan, lignin, cellulose, ash and nitrogen were estimated. Pulp of Lantana stalks was carried out by semichemical and hydrothermal methods. The pulp yield decreased from 80.2 to 59.8% when digested with increasing amounts of sodium hydroxide from 1 to 5% based on dry weight of the material. The hydrothermal pulp yield ranged from 67.1 to 86.2% when the digestion temperature varied from 150 to 110°C. The slow drainage rate of Lantana pulp was improved by blending with pine wood pulp. Fibreboards produced from Lantana and pine wood blended pulp possessed strength properties ranging between 242 and 556 kg/cm<sup>2</sup> for untempered boards depending upon process conditions. (Edited author abstract) 8 refs.

## Printing Properties

**076293 PRINT QUALITY AND SURFACE SPEEDS.** Better print quality on corrugated packaging is the objective of plants everywhere. The need for accuracy in making, mounting, proofing, and caring for printing plates has been addressed in several recent journal articles and conference papers. The advantages of selecting quality inks and controlling viscosity also have been stressed. Substitution of different mat materials and adhesives can change the total thickness of the printing plate, causing poor printing, registration problems, and excessive plate wear.

Ashwood, Loren F. (SAS Int Inc, New Franken, WI, USA). *Tappi J* v 70 n 10 Oct 1987 p 51-52.

## Production See PAPERMAKING—Quality Control.

## Quality Control

**076294 STATISTICAL PROCESS CONTROL IN A PAPER MILL.** The actual use of SPC (Statistical Process Control) follows this general procedure. A process variable is monitored on a control chart and the average value of that variable is calculated (termed  $\bar{X}$ ). Upper and lower statistical limits for variation are calculated from simple formulas based on three standard deviations from the average (commonly referred to as  $3\sigma$ ). If system variations stay within these limits, that variable is predictable to an accuracy of 99.7% within that range. If not, of course, the object is to get it there by identifying the variation causes and eliminating or reducing them. The system is then evaluated for capability. If the process specifications lie outside the statistical limits, the process is statistically under control and capable of predicting that the product will be within specifications to an accuracy of 99.7%. Factor pertinent to implementing SPC are also analyzed. A discussion is also presented of what points in the process required monitoring. Improvements achieved through the use of SPC are outlined. 2 refs.

Guillory, A.L. (Temple-Eastex Inc, Silsbee, TX, USA). *Chem Eng Prog* v 84 n 4 Apr 1988 p 52-57.

## Sizing See Also PAPERMAKING—Sizing.

**076295 SIZING OF PINE NEEDLE FIBRE-BOARDS.** Experiments were done to improve water resistance of pine needle waste paper-blended fibreboards by the addition of additives during manufacture and by coating of the finished board with wax and wax rosin mixture. Wax-coating was done by three different techniques. In one set of experiments amount of wax uptake per sq m of the board was also varied. Wax treatment, especially by dipping method, is most effective in improving water resistance properties but it has the disadvantage of maximum absorption of wax per sq m of the finished board. There is no appreciable difference in water resistance properties of wax-rosin coated pine needle fibreboard irrespective of the proportion of rosin in wax. (Edited author abstract) 6 refs.

Negi, Jeet Singh (Regional Research Lab, Jammu-Tawi, India); Chawla, J.S. *Res Ind* v 32 n 1 Mar 1987 p 8-13.

## Testing

**076296 COMPRESSIVE LOAD-STRAIN CURVE OF PAPERBOARD: RATE OF LOAD AND HUMIDITY EFFECTS.** This paper reports the effect of load rate and humidity on edgewise compression properties of paperboard. One linerboard and one corrugating medium were tested at three load rates; 263 N/m/s, 2.63 N/m/s, and 0.0263 N/m/s, under constant 50% and 90% relative humidity (rh). Both paperboards exhibited lower compressive strength, smaller initial stiffness, and larger failure strains as load rate was reduced. Compressive strength and initial stiffness were found to vary with the logarithm of load rate. The results also show that the paperboards in this study were more affected by load rate

at 90% rh than at 50% rh. The hyperbolic tangent model is extended to determine load as a function of strain and load rate. In this model, comparison of the machine direction (MD) and the cross-machine direction (CD) response shows that the CD is more sensitive to load rate at 50% rh, but that the MD is more sensitive at 90% rh. 12 refs.

Gunderson, D.E. (USDA, Madison, WI, USA); Considine, J.M.; Scott, C.T. *J Pulp Pap Sci* v 14 n 2 Mar 1988 p 37-41.

**076297 UNIQUE CONVERTIBILITY OF PAPERBOARD.** Although the tensile strength or bending stiffness of paperboard is high, in general the material possesses good fold, creasing or scoring properties. Both crease and fold resistance are surprisingly low, as is the rate of crack propagation along the deformation lines. The background to this characteristic is explained. It is necessary to keep the compression strength as low as possible in the development of paperboard; if compression strength needs to be raised, e.g. for end-usability, tensile strength also needs to be increased, or brittleness reduced, at least in the outer layers of the material. If these adjustments are not made, the properties that make for good convertibility are degraded, according to the results presented. (Edited author abstract) 29 refs.

Cavlin, S.I. (Swedish Packaging Research Inst, Spanga, Sweden). *Pack Technol Sci* v 1 n 2 Apr-Jun 1988 p 77-92.

## Ultrasonic Effects

**076298 AUTOMATIC DETERMINATION OF ULTRASOUND VELOCITIES IN PLANAR MATERIALS.** A computer-controlled, fully-automated instrument which measures ultrasound velocities in planar materials is presented. By finding two longitudinal and two transverse velocities, it can completely characterize the in-plane elastic properties of an orthotropic sheet. Even though it is specifically designed to analyze paper and paperboard samples, other sheet materials can also be tested. (Author abstract) 14 refs.

Van Zummeren, M. (Inst of Paper Chemistry, Appleton, WI, USA); Young, D.; Habeger, C.; Baum, G.; Treleven, R. *Ultrasonics* v 25 n 5 Sep 1987 p 288-294.

## PAPERMAKING See Also PAPER; PAPER—Newsprint; PAPER—Packaging; PAPER AND PULP INDUSTRY; PAPERMAKING MACHINERY—Wet End; PULP MANUFACTURE—Refining.

**076299 TEMPERATURE-GRADIENT CALENDERING OF FOODBORD.** Temperature-gradient (TG) calendering produces smooth, glossy surfaces with less bulk reduction than conventional machine calendering. The unheated paper web is calendered in a single pass through a nip between two hot calender rolls. The web touches the hot rolls only in the nip. Consequently, the surface fibers are permanently deformed to a greater extent than the fibers in the middle of the paper, and a better surface finish can be achieved with less bulk reduction. In this study, sized and unsized food boards were calendered using both the TG and the conventional calendering methods. The objective of the study was to determine whether there are any benefits in applying the TG-calendering technique to food boards and other heavy paper products. 8 refs.

Gratton, M.F. (Paper & Pulp Research Inst of Canada, Pointe Claire, Que, Can); Seth, R.S.; Crotoigno, R.H. *Tappi J* v 71 n 1 Jan 1988 p 81-86.

**076300 FIBER WEB SUPPORT OF THE FORMING WIRE.** Two factors that affect the initial paper web formation are: (a) the optimum geometrical shape of the 'frames' formed between crossing strands in the forming surface of the wire and (b) the strand density, quantified as specific fiber-supporting length per unit area. Based on simplified models of fibers and wire structure, a frame form close to a square is considered to be the optimal one even for highly oriented furnishes. The typical frame dimensions of today's commercial wires lie within a range where rather minor changes may result in significant

changes in the initial fiber retention. Good qualitative agreement was found between calculated fiber support and first-pass fiber retention. (Author abstract) 8 refs.

Helle, Torbjorn (Norwegian Inst of Technology, Trondheim, Norw). *Tappi J* v 71 n 1 Jan 1988 p 112-117.

**076301 MULTILAYER FORMING AND THE SHEET PROPERTIES OF TISSUE.** The Valmet-KMW research centre at Karlstad majors in multilayer forming and tissue production. Trials show that large amounts of CTMP - over 50% - can be successfully used in a multilayer tissue sheet. Multilayering solves the coating problems caused by CTMP on the Yankee dryer, and reduces energy consumption. Research is also revealing the role of pressing in soft and bulky tissue and exploring the drying and creping procedures. The multilayer technique for the production of tissue and towel was first introduced more than 10 years ago. This paper will describe how production and sheet properties can be affected by multilayer forming.

Andersson, Ingmar (Valmet-KMW, Sweden). *Pap Technol Ind* v 29 n 1 Feb 1988 p 28, 30-31.

**076302 EFFECT OF MACHINE SPEED ON FORMATION, DRAINAGE, AND RETENTION.** Machine speed is the most prominent of the many factors affecting paper machine productivity. The pursuit of higher productivity has led to a dramatic increase in machine speeds in recent years. These higher machine speeds have been achieved in large part through development of better techniques for the efficient removal of water from the wet paper web. The evolution of drainage technology, in turn, has affected the interplay of hydrodynamic and chemical forces that govern flocculation, retention and sheet drainage and formation. As paper machine speeds increase, undesirable side effects are often encountered in the wet end. An increase in the number of web breaks can reduce the availability—and the productivity—of a machine whose speed has been increased. Deposition of latex or other suspended impurities can adversely affect product quality and reduce machine productivity. (Edited author abstract) 27 refs.

**076303 PAPERMAKING PAST AND PRESENT.** The Chinese invention of paper some two thousand years ago, together with the complementary invention of printing from movable type, was one of the seminal developments in the history of civilization. Together, they constitute a unique and enormously powerful means for the storage and dissemination of knowledge. Today, the printing industry in all its forms is the major user of paper, but enormous quantities are also used for packaging, tissues and toweling, sacks, wall coverings, and many other purposes. Although the papermaking process is still in principle virtually the same as that developed by the Chinese, the enormous increase in demand and the much wider range of paper products required has led to considerable developments in the papermaking process. (Author abstract). 5 Refs.

**076304 COMBINATION OF HIGHLY CHARGED POLYELECTROLYTES WITH RETENTION AGENTS: RETENTION IN THE PRESENCE OF INTERFERING SUBSTANCES.** During papermaking, anionic 'trash' is often introduced into the papermaking system. Under conditions resembling those in a mill, a laboratory experiment was set up to demonstrate the influence of such interfering substances on a representative parameter, ash retention. Ash retention was measured as a function of the concentrations of retention aid (polyacrylamide) and short-chain cationic polymer. The adsorption of the polymers is the key to the retention process. Because of the differences in adsorption behavior between short-chain polymers with a high charge density and polymers of high molecular weight, two cationic

components are used for retention in the presence of interfering substances. The short-chain polymer is used to neutralize the interfering substances in solution and to control the number of binding sites available for the high-molecular-weight component. (Author abstract). 10 Refs.

**076305 DTPMPA: POLYAMINO POLYPHOSPHONIC ACID AND ITS USE IN PAPER RELATED PROCESSES.** Paper was produced from silicate-free pulp bleached with DTPMPA as the peroxide stabilizer on the pilot plant of CTP, Grenoble, France. Using such pulp, the efficiency of retention aids on both fines and fillers is greatly enhanced. Evaporation of water from the paper sheet is accelerated and can lead either to substantial energy savings or faster throughput on the machine. The quality of the finished product is unchanged, but some improvement in the final sizing quality can be seen. (Author abstract).

**076310 NEW CHEMICAL APPROACH TO WATER REMOVAL.** A UK fine paper-mill has increased machine speed by 5.8%, improved formation and retention, and reduced steam pressure by 43%, by means of the new technology of supercoagulation. The system has two components: a synthetic polymer which is added early in the papermaking process - in the thick stock, for example; and an inorganic pigment which is added just before the flowbox, to induce total coagulation. It can be applied to acid and alkaline systems, and over a wide range of paper qualities. (Author abstract)

O'Brian, Hugh. *PPI Pulp Pap Int* v 30 n 2 Feb 1988 p 60-61.

**076312 RELATIONSHIP BETWEEN PRINT MOTTLING AND COATING STRUCTURE.** A method of obtaining the surface profile of the binder distribution was developed using ESCA (electron spectroscopy for chemical analysis) with an analyzer slit with an effective area of 2 mm in diameter. Furthermore, a quantitative method for evaluating print mottle by image analysis was developed. Print mottle was caused by nonuniform absorption of dampening solution corresponds directly with the nonuniformity of the surface distribution of binders and pigments. Both print mottle and nonuniformity of binder distribution at the coated surface have a scale of 1-3 mm in diameter. 15 refs.

**076313 MILL EXPERIENCE WITH GATE-ROLL-COATED PAPERS.** The gate roll coater is described as a single tool to improve printability. Gate-roll-coated papers have been welcomed by printers and publishers, and the sales of these grades have been growing steadily in Japan. Pigment coating with the gate roll coater improves the printability of paper substan-

tially, though not as extensively as blade coating. A streak-free coat is the most outstanding merit of gate roll coating.

Hirakawa, M. (Jujo Paper Co, Ishinomaki, Jpn); Iwase, H. *Tappi J* v 71 n 5 May 1988 p 53-57.

**076314 APPLYING PILOT COATER RESULTS TO MILL PRACTICE.** Pilot coaters are useful tools in minimizing the risk during the development of new coating formulations or paper grades. Many problems associated with runnability can be studied, and the results correlate well with subsequent mill practice. In all cases where printability is the subject of the experiment, one should be careful in interpreting the results. Generally, all experiments meant to duplicate on-machine coating can only be regarded as showing tendencies. Such tendencies can be established, but a direct correlation with mill practice seldom exists, especially for board. There are other phenomena which cannot be studied on a pilot coater, such as blade wear or other long-term effects. On the other hand, the influence of various coating head configurations (or different blade positions) can be studied easily on the pilot coater. 3 refs.

Rohmann, Michael E. (BASF, Ludwigshafen, West Ger). *Tappi J* v 71 n 5 May 1988 p 61-67.

**076315 CASE STUDIES ON THE USE OF THE OPTICAL MICROSCOPE IN THE ANALYSIS OF COATED PAPERS.** The polarizing microscope is shown to be a powerful analytic tool when applied to coated papers. Among its many uses is the identification of particle contaminants found by the mill quality control laboratory or in the printing plant. Even microscopic quantities of synthetic filaments can be identified by refractive index techniques, dye-staining techniques, or solubility tests. To identify and locate pigments and binders, both chemical and optical staining are used. Microchemical staining is a commonly known technique that can be applied in both surface studies and in cross-sectional studies. Optical staining is less well known and demands a knowledge of the adjustment possibilities of the optics in a polarizing microscope.

Quackenbush, Dale (Island Microscopy, Eastsound, WA, USA). *Tappi J* v 71 n 5 May 1988 p 70-75.

**076316 COMPARISON OF U.S. AND EUROPEAN COATED PAPERS.** The structure of the U.S. market in terms of the apparent consumption for the five main coated paper groups, coated two-sides (C2S) Nos. 1 to 5 and the rate of growth for each group is examined. A comparison is made of the physical characteristics of U.S. and European coated papers considering major differences in brightness and opacity between U.S. and European papers. Some indication of why European papers are different from their U.S. counterparts and in what way European papermaking practice differs from that in the U.S. is given. In summary, it has been shown how superficially similar the U.S. and European markets are. 2 refs.

McAuley, D. (ECC Int Ltd, St. Austell, Engl). *Pulp Pap Can* v 89 n 4 Apr 1988 p 43-48.

**076317 EMERGING TRENDS IN COATING.** U.S. and Canadian papermakers apply coatings to a considerably greater percentage of their production than the industry does in the rest of the world. The reasons for this trend are examined and changes taking place especially in Europe, are pointed out. The trends towards greater efficiency and versatility in paper and paperboard coating in America as well are noted. The Combs-Blade coater by Jagenberg which allows the user to switch metering systems to different blades is described. Hydro-Bar elements replacing blades and the short dwell coater are described.

## Coatings

**076319 PLC'S MAXIMIZE PRODUCT QUALITY, KEEP COATING PROCESS ON TARGET.** Wavervliet Paper uses programmable controllers in their color kitchen to run the new on-machine coater. Operators have total control over process variables. Tear-out and roll-out tests indicate the coating process is being controlled within narrower limits than ever before. At the same time, reduced handling has cut labor requirements and product losses, improving the company's profitability and productivity. As a result, the company has the ability to enter new markets where cost, quality, and consistency of coated stock are critical to customer acceptance.

Anon. *Pulp Pap* v 62 n 6 Jun 1988 p 124-126.

## Coloring See Also PIGMENTS—Performance.

**076320 IMPROVING COLOUR CONSISTENCY THROUGH CLOSED-LOOP CONTROL.** Great consistency in paper colour can be achieved through the latest closed-loop technology. The computer measures colour continuously through sensors above and below the sheet. It plots colour trends - opacity, pump stroke, moisture and dye usage - and, through control of the dye dispensing pumps, reacts rapidly to change. If the sheet breaks dye flow is reduced, and if broke is added, the computer compensates. The hardware and software of closed-loop control are described in this article. (Edited author abstract)

Lorditch, George M. (Kollmorgen, New York, NY, USA). *Pap Technol Ind* v 28 n 7 Oct 1987 p 634-635.

**076321 IMPROVING QUALITY AND OUTPUT THROUGH COLOUR CONTROL.** Traditionally, color matching has been accomplished through visual comparison by a trained 'colorist', or by laboratory instruments on a once-per-reel basis. On-line measurements supported by a microprocessor-based control system afford an excellent means for the colorist to improve traditional color machine methods, in any situation where shade matching is important. To meet this need, AccuRay has introduced a system which provides reliable measurement and precise control of color. The purpose of this paper is to describe the color package in terms of the measurement technology, control strategy, and results to date.

Marchi, Robert (AccuRay). *Pap Technol Ind* v 29 n 2 Mar 1988 p 72-75.

**076322 INVESTIGATION INTO THE MECHANISM OF TITANIUM-DIOXIDE EXTENSION BY CALCIUM CARBONATE.** Sheets produced from a furnish containing equal weights of  $\text{TiO}_2$  and  $\text{CaCO}_3$  have a light-scattering coefficient that is nearly equal to that of pure  $\text{BO}_2$ . The authors found that the light-scattering behavior of the pigment mixture could be described by an equation that assumes the blended pigments act independently of one another. It is well known that lowering the loading level of a pigment increases its dispersion and thus its light-scattering efficiency. The authors reasoned that independently acting pigments in a 50/50 mixture would each disperse as if it were loaded at 50 percent of the total load. The greater dispersion would then increase the light-scattering efficiency of each pigment. (Edited author abstract). 7 Refs.

## Computer Simulation

**076323 SIMULATING THE DEVELOPMENT OF PULP AND PAPER PROPERTIES IN MECHANICAL PULPING SYSTEMS.** Process simulation, property modelling and optimization techniques have been combined to predict optimum performance and quality of pulp and handsheets for high-yield pulping systems. The technique involves a new set of fundamental variables called performance attributes which link the material and energy flows in the process to predictive property models. The effects of refining, screening, cleaning, mixing and bleaching are shown for a typical TMP process. (Author abstract). 14 Refs.

## Contamination

**076324 'ANIONIC TRASH': CONTROLLING DETRIMENTAL SUBSTANCES.** This paper looks at some of the principal facts about detrimental substances, to give some new details about their interaction with other materials and to give a few examples of paper mills where the whole papermaking process was improved by adding process chemicals in spite of a large amount of detrimental substances in the paper stock or in the raw material. Detrimental substances are defined as the total amount of anionic oligomers and polymers and nonionic hydrocolloids. Chemically, these detrimental substances can be of a different organic and inorganic nature and of different origin. 22 refs.

## Drainage See PAPERMAKING MACHINERY.

**Drying** See Also PAPER—Drying; PAPER—Newsprint; PAPER AND PULP MILLS—Machinery; PAPERMAKING MACHINERY—Design; PAPERMAKING MACHINERY—Dryers; PAPERMAKING MACHINERY—Felts.

**076325 INSTANTANEOUS MEASUREMENT OF DENSITY PROFILE DEVELOPMENT DURING WEB CONSOLIDATION.** A new method for measuring the instantaneous z-direction density profile of fiber mats during consolidation is described. The measurement technique involves the tracking of special open-mesh targets embedded in the sheet at various levels by a noncontact displacement measuring system mounted in the bottom press platen. Factors of critical importance to successful measurements are discussed. Density profile measurements made under wet pressing and impulse drying conditions are presented to demonstrate the applicability of the measurement technique. (Author abstract) 12 refs.

Burton, S.W. (Union Camp Corp, Princeton, NY, USA); Sprague, C.H. *J Pulp Pap Sci* v 13 n 5 Sep 1987 p 145-150.

**076326 IMPULSE DRYING AND HEAT RECOVERY HEAD THE LIST OF THE LATEST DEVELOPMENTS.** Drying has drawn increased attention recently with the development of exciting new techniques. First among these is impulse drying. Still in its early stages, if the potential it holds is realized, it could radically alter the papermaking process. Impulse drying removes water both thermally and mechanically. High-pressure steam is generated rapidly in the web as it is passed through a nip with a hot, top roll. Liquid water is displaced from the sheet onto the felt. Test data show that a 40%-solids web sent through a nip with a heated roll at speeds up to 300 m/min achieves a solids content of 60% after one pass.

Rodden, Graeme (Pulp & Paper Canada, Don Mills, Ont, Can). *Pulp Pap Can* v 88 n 9 Sep 1987 p 56-58.

**076327 SURVEY OF CANADIAN NEWSPRINT DRYER SECTIONS: PART I - TECHNICAL DATA.** A survey of 92 dryer sections of newsprint and groundwood

specialty paper machines at 30 Canadian mills was carried out to determine the energy consumption patterns and the overall drying performance. This paper on the survey results gives basic technical information on items such as: machine type, size and speed; pulp furnish; steam-condensate systems; and pocket ventilation. (Edited author abstract) 3 refs.

Sayegh, N.N. (Paprican, Pointe Claire, Que, Can); Pikulik, I.I.; Simonsen, H.I. *Pulp Pap Can* v 88 n 12 Dec 1987 p 217-221.

**076328 IMPULSE DRYING: A HOT IDEA IN PAPERMAKING TECHNOLOGY.** The large capital and operating expense of removing water from the wet web during the papermaking process is a significant industry problem. Research to develop compact and efficient de-watering processes is therefore important. Impulse drying offers one of the most promising solutions of the new dewatering technologies for the industry.

Thompson, Randall A. (Westinghouse Electric Corp). *PIMA Mag* v 69 n 11 Nov 1987 p 39-40.

**076329 PRESS DRYING CAN LOWER ENERGY COSTS.** After-press drynesses of over 50% have been achieved by 11 mills after installing a new type of press section. In the case of Spanish company, Papelera del Arlanzon, the after-press dryness was 57-58% on its PM making 140-160-g/m<sup>2</sup> packaging grades, while Mexican producer Papelera Atlas has recorded a dryness of 54% on its machine, making 240-g/m<sup>2</sup> board. Central to the new press section is a large-diameter cylinder, coated with a special alloy, and heated internally by steam injection at pressures of 0-3 kg/cm<sup>2</sup>. It forms the press section nips with several press rolls which allow progressively higher pressures to be applied to the paper web. Pressing periods are longer than usual thanks to the diameter of the central cylinder, and there are no open draws.

Garcia, Ernesto. *PPI Pulp Pap Int* v 29 n 10 Oct 1987 p 71, 73.

**076330 PRESS DRYING: A WAY TO USE HARDWOOD CTMP FOR HIGH-STRENGTH PAPERBOARD.** Chemithermomechanical pulp (CTMP) is not presently used in linerboard or corrugating medium. Because of its high lignin content and stiff fibers, CTMP dried conventionally cannot achieve sufficient bonding for products requiring high strength. Results show that press-drying technology offers potential for using high-yield CTMP made from hardwoods for the manufacture of high-strength paperboard products. With the exception of tear strength, strength properties of press-dried CTMP paperboards were equivalent to or better than those of commercial paperboards. In particular, compressive strength of the CTMP paperboards was much higher. Combined board and containers made from press-dried CTMP paperboards met current expectations except in impact resistance. At high humidity, we noted high retention of short-column strength in the combined board and of top-to-bottom compressive strength in the containers. (Author abstract) 13 refs.

Horn, Richard A. (USDA Forest Service, Madison, WI, USA); Bornett, David W.; Setterholm, Vance C. *Tappi J* v 71 n 3 Mar 1988 p 143-146.

**076331 ENERGY SAVING THROUGH HOT PRESSING.** It is shown that heating the sheet in the press section can significantly reduce steam requirements in the dryer section. A model is constructed that compares the relative efficiencies of mechanical vs. evaporative water-removal. The model identifies situations when steam applied at the hot press removes more water than a comparable amount of steam in the dryer section. A mill can use this information to optimize the allocation of steam for use in drying the wet web. The model predicted that two newsprint mills and one linerboard mill would be able to save energy by shifting some of the steam from their dryer sections to a steam shower in the press section.

These mills responded by altering their drying strategies. The net energy savings obtained by the mills matched or exceeded the model's predictions.

Cutshall, Keith (Devron-Hercules Inc, North Vancouver, BC, Can). *Tappi J* v 71 n 4 Apr 1988 p 89-91.

**076332 PENNIMAN PROCESS; A NEW PAPER-MAKING PROCESS.** The process, which involves the addition of synthetic hydrocarbons after the formation and before the press section, was discovered accidentally - pure kerosene, instead of kerosene emulsion, was applied to the press section felts on a modern newsprint machine, and steam pressure in the dryer section fell by half. The typical effect of the Penniman Process on physical properties is to produce a thinner, stronger, smoother and stiffer sheet - not unlike the effects achieved by the impulse drying process. The process also allows the use of chemical additives - at usage reductions as great as 60-80% - to improve wet and dry strength; de-bonding/apparent softness; sizing; brightness and color. This new procedure avoids the destructive effect of anionic trash, and can result in virtually 100% retention. 4 refs.

**076333 DRYER SHEET STABILITY FOR OLDER PAPER MACHINES.** There have been many advances in dryer section sheet runnability for older paper machines. It is now possible to reach competitive speeds with an older dryer section design. Sheet stabilizing devices are commonplace on most high-speed dryer sections. Improvements in this area continue to be made. Proper attention to both the air movements and the design of the dryer drainage system are needed to achieve the best results. (Author abstract).

Hill, Kenneth, C. (Engineering & Technical Services, Knoxville, TN, USA). *Tappi J* v 71 n 8 Aug 1988 p 55-59.

**076334 IMPROVED DEWATERING OF SHEETS BY A PETROLEUM HYDROCARBON.** A petroleum hydrocarbon applied in the form of spray on the surface of bandsheets enhanced the dewatering, or increased the consistency, during pressing and drying. Results from differential scanning calorimetry and thermogravimetric analysis indicated that the removal of water from the hydrocarbon-treated sheets took place at a lower temperature and required less energy than the control sheet. The addition of the petroleum hydrocarbon did not have any significant effect on the sheet properties. (Author abstract). 21 Refs.

**Finishing** See Also PAPERMAKING MACHINERY—Automation.

**076336 FINISHING - NO LONGER THE CINDER-ELLA OF THE MILL.** When Thames Board of Great Britain trebled the capacity of their Workington mill to 150 000tpy, an automated finishing department with the latest bar coding, palletising and shrink wrapping technol-

ogy was set up. The author describes the technology and the computer system that runs it. He describes the teething problems with the Omega computer system which did not have the capacity to handle the expanding mill, and the switch to OSCAR - an order scheduling, control and reporting system that lays the foundations for mill-wide control. (Edited author abstract)

Heyworth, J.L. (Thames Board, Engl). *Pap Technol Ind* v 28 n 7 Oct 1987 p 637-640.

**076337 FUTURE TRENDS IN ROLL FINISHING.** Automation is changing the borders of different tasks in roll finishing. Modern wrapping line lay-out and smooth roll handling systems together with today's computer-based controls provide excellent possibilities to increase productivity and at the same time add safety and increase motivation of the operators who supervise automatic machinery instead of operating it. The justification of new equipment has to come from productivity increases. An improved working environment makes sure that the goals will be met. (Author abstract)

Kotiaho, P. (Valmet-Appleton Inc, Appleton, WI, USA). *Pulp Pap Can* v 89 n 1 Jan 1988 p 133-137.

**076338 NEW CHALLENGES FOR PROCESS COORDINATION IN PAPER FINISHING AND CONVERTING.** At many paper finishing or converting operations today, automation technologies are often applied to isolated machines within the overall process, creating islands of automation. These automation technologies include electronic generation of the shipping manifest through the use of bar codes, automatic storage and retrieval systems, and automated slitter positioning. Their use has made the operator in the finishing room more productive by minimizing the tasks that demand the operator's direct attention. The sequential nature of the finishing and converting process has, however, increased the number of potential bottlenecks. Process coordination can be optimized by adding process diagnostics that link the knowledge of the user and the knowledge contained in the control system.

**076341 ON- AND OFF-MACHINE SOFT-NIP SURFACE FINISHING OF COATED GROUNDWOOD AND WOOD-FREE PAPER GRADES.** For decades, the supercalender has been the classic soft-nip finishing equipment for production of high-quality coated paper

grades. Even with improvements and speeds up to 1000 m/min, the supercalender is still limited by the fact that it is a purely off-machine operating unit. With further improvements in components, roll covers, and coating formulations, the soft calender may become a viable alternative to the supercalender. On-machine soft-nip calendering reduces space requirements and lowers operating costs through reductions in labor and broke. It also provides a uniform, gentle densification of the sheet without sacrificing opacity, strength, and brightness. The soft calender allows the pressure and temperature in each nip to be controlled individually over a wide range. The flexibility in obtaining finishing effects is far superior to advanced supercalendering technology. This concept also reduces two-sidedness in the paper web. 7 Refs.

Winkels, Heinz (Kleinewefers, Krefeld, West Ger); Svenka, Peter. *Tappi J* v 71 n 8 Aug 1988 p 97-103.

**076342 PRACTICAL ASPECTS OF CALENDER STEAM SHOWERS.** Calender steam showers raise the sheet temperature and increase the sheet moisture content, both of which improve the properties of the sheet surface. Results from calender steam installations on newsprint and specialty groundwood machines show that smoothness improvements of up to 23 percent have been achieved. The extent of smoothness improvement depends on a number of factors, including sheet weight, machine speed, steam shower location, incoming sheet temperature to the calender, and type of furnish. A calender steam shower is an option to consider if sheet smoothness and gloss improvements are required or if sheet two-sidedness is a problem. (Edited author abstract). 3 Refs.

**076343 HAINDL PAPIER TAKES ADVANTAGE OF LIGHTWEIGHT COATED BOOM IN EUROPE.** A description is given of a mill expansion program that sought the acquisition of a paper machine, an offline coater with coating kitchen, elaborate finishing equipment, and expansion of thermomechanical pulp (TMP) production. Mill design capacity is 1,250 metric tpd, with a grade range across the LWC spectrum (single- and double-coated, 42 to 170 g/m<sup>2</sup>) carrying the brand name Valsa. A discussion covers the thin-wire formers and finishing equipment.

Anon. *Pulp Pap* v 62 n 10 Oct 1988 p 74-75.

**076344 GNP UTILIZES DIVERSE TECHNOLOGIES TO MODERNIZE ITS FINISHING ROOM.** A description is given of a modernization plan that included rebuilds of two paper machines, installation of a computerized roll tracking system (RTS), and total automation of its manual wrapping lines. The finishing area requirements included reduced manpower, limited material storage, and minimal car switching, which contrasted with the need for maximum flexibility in assigning rolls to orders and monitoring real-time status of the finishing operations. Potential RTS vendors were required to provide standard DEC hardware and VMS-based (DEC's standard operating system) software throughout the system. This would ensure compatibility with the existing CIS system and make ongoing maintenance costs of hardware and software easier to control. The function of the RTS system is discussed. Ref.

**Inspection**

**076345 STROBE SYSTEM PINPOINTS QUALITY PROBLEMS, MACHINERY FAULTS.** Finch Pruyn & Co., Inc., Glens Falls, N.Y., has a new way to detect minute blemishes in quality, save waste paper and speed

the diagnosis of machine problems. The firm uses stroboscopic flood lights to create slow-motion images of paper formation at 600 to 1,400 fpm. Unilux lighting emits pulses of light, as many as 250 per second. Each pulse is an intense burst that lasts only a ten-millionth of a second. A pulsed light source of sufficient intensity and short enough duration provides the eye with a series of frozen images. The eye has time to focus on each image without any blur. The high-intensity overpowers ambient light.

## Japan

**076346 FOURTH PRESS OPERATION IN JAPAN.** High-speed paper machines with three presses can be rebuilt with a fourth press. In 1975, a fourth press was installed for the first time in a Japanese mill. There are now 26 fourth presses running on paper machines producing newsprint, coating raw stock, and fine paper. Addition of a fourth press section has provided additional dewatering capacity and has improved sheet properties in many Japanese mills. Off-press solids have been increased by 2-3% for newsprint grades, resulting in higher machine speeds, fewer breaks, and lower stream consumption. Printability has been improved by a reduction in two-sidedness. Lower porosity and higher internal bond were obtained with increased fourth-press nip loads on a coating-rawstock grade. For printing grades, wire-side sheet surface strength was improved to enable multicolor printing. An improvement in felt-side smoothness eliminated two sidedness.

**076348 SUPPLIER REPORT CARDS - A ROUTE TO TOTAL PERFORMANCE.** Obtaining raw materials of high quality encompasses more than statistical process control of measured variables. A good relationship with suppliers allows a common understanding about the mill's requirements. When raw materials parameters are measured, the results must be communicated back to suppliers if problems are to be solved objectively and efficiently. At consolidated papers, suppliers, are graded on quality, delivery, and service performance and trends point to improvements over the past three years. The mill has had fewer production upsets caused by inadequate materials and mill personnel feel that the benefits of this program outweigh its administrative costs. (Edited author abstract).

**Mathematical Models** See PAPERBOARDS—Corrugated.

## Measurements

**076349 ULTRASONIC MEASUREMENT OF GASEOUS AIR IN PULP SUSPENSIONS.** This paper is based on a discovery made in the laboratory during experiments involving ultrasonic interaction in a pulp suspension. Large air bubbles were observed to have only a modest effect on the attenuation of ultrasonic transmissions, while entrained air produced a far more dramatic response. In the case of entrained air, the water-air

interface scatters sound strongly. This occurs because of the considerable difference between the acoustic impedances of water ( $1.5 \times 10^6$  kg/m<sup>2</sup>s) and air ( $4.3 \times 10^2$  kg/m<sup>2</sup>s). The entrained air attaches to the fiber flocs in the suspension and scatters sound effectively. The method has been tested in the laboratory and in several paper mills. Tests prove that a commercial meter can be developed to control the feed of chemical defoamer in paper machines. 9 refs.

## Nonfibrous Materials

**076350 USE OF FILLERS IN PAPERMAKING.** Mineral fillers are used to increase the opacity of paper and reduce the use of expensive cellulose fiber. Fillers reduce the strength and, at high levels, the feel of the paper. However, available technology permits the use of 50% or more filler without substantial loss of strength or feel. Many, if not most, fine paper mills in Europe have converted their acid systems to alkaline systems. The advantages of alkaline sizing include the ability to increase the filler content without sacrificing strength, reduced energy usage, improved runnability, and better paper quality, especially in the areas of heat and light stability. North America seems to be following the lead of Europe in converting to alkaline-sized filled sheets. There is a wide choice of fillers available to reduce the material costs for such commodity fine papers as offset, xerographic copy, etc. Many are compatible with an acid or an alkaline system. 18 refs.

## Pressure Measurement

**076351 MEASUREMENT OF CALENDER NIP PRESSURE.** A reliable and inexpensive method has been developed to measure cross-machine direction nip loads in calender stacks. This technique can be carried out with carbonless nip impression paper, a brightness meter and a microcomputer. The measurements are independent of the characteristics of the nip impression paper and the brightness meter because of a novel, in-situ calibration technique. Several examples are presented to show how this method can be used to identify problems in calender and breaker stacks. (Author abstract) 9 refs.

**076352 AIR CONTENT, RETENTION AND DRAINAGE: IMPORTANT PARAMETERS IN PAPER/BOARD PRODUCTION.** Reduction of air content and improvements in retention and drainage are important in achieving the best quality in paper and board production. With several examples from mill experience, the possible effects that can be reached with the existing chemical additives for these applications are discussed and illustrated. (Author abstract) 6 refs.

Lorz, R.H. (BASF AG, Ludwigshafen, West Ger). *Pulp Pap Can* v 88 n 10 Oct 1987 p 85-89.

**076353 WATER SPRAY SYSTEMS HELP MILL MEET CUSTOMER SPECS.** About a year ago, PWA Industriepapier began using cross-machine control at its fluting mill in Aschaffenburg, West Germany. The two moisture profiling systems - Microset Water Sprays multi-plexed through an AccuRay 1180 Micro - were installed on the mill's PMs No. 3 and No. 4. The moisture actuators correct profile variations by selectively applying an atomized mist of water to the driest portions of the sheet. The system consists of a sprayboom and a series of spray nozzles six inches apart.

Anon. *PIMA Mag* v 69 n 11 Nov 1987 p 37-38.

**076354 CLOTHING PERFORMANCE EVOLUTION HAS LED TO PAPER MACHINE ADVANCES.** The article illustrates just how important the development of machine clothing has been in helping to increase paper production. A southeastern mill, producing fine and brown paper, recently celebrated its fiftieth anniversary. The information given was part of an exhibit showing the growth of that complex. It is obvious that longer clothing life resulted in less down-time and higher production. Designs developed since the early 1970s have also helped to increase machine speeds because of their ability to handle more water while impacting the desired sheet finish. All of these advances in paper machine clothing over the past 50 years have been the result of years of R&D and have all had the same goal: to produce a higher-quality sheet of paper at faster speeds and at a lower cost to the paper industry.

Banks, Roger (Wagner Systems, Greenville, SC, USA). *Pulp Pap* v 62 n 5 May 1988 Op 83-85.

**076355 UNDERSTANDING THE EFFECT OF SAMPLING AND TESTING ERROR.** To interpret quality control test data properly, one must understand the effect of error in sampling and testing. The sampling and testing error for key tests needs to be examined and quantified. If such errors are excessive, it is necessary to design experiments to identify the major sources of variation, which could be in the sampling, the sample preparation, instrument calibration, operator differences, etc. The contribution of sampling and testing variation to total variation can generally be reduced by making additional measurements. Results from designed experiments can provide direction as to the need for more sampling, more testing, or possibly both.

Jaehn, A.H. (Consolidated Papers, Inc, Wisconsin Rapids, WI, USA). *Tappi J* v 71 n 8 Aug 1988 p 187-188.

**076356 HOW TO MEASURE ROLL QUALITY.** The article outlines a comprehensive approach for setting up a statistical quality control program in the finishing room. The author describes methods commonly used to measure roll structure, including hardness impacters (billy club, Rhometer, Schmidt hammer), strain-based tests (Cameron gap, J-line), friction-based tests (core torque, pull tab, Smith needle), rewinders, and density analyzers. The author also presents a method for evaluating these tests based on accuracy, ease of use, cost, destructiveness, and utility of the measured variable. A discussion of statistical methods at the end of the article shows how to correlate defects and measured parameters and how to determine confidence levels in the results of the program. (Edited author abstract). 36 Refs.

Roismun, David R. (Oklahoma State Univ, Stillwater, OK, USA). *Tappi J* v 71 n 10 Oct 1988 p 91-103.

**076357 HAVING CONFIDENCE IN ON-LINE INSTRUMENTS.** Implementing an on-line system successfully involves a two-phase program designed to build user confidence. The first phase is a meticulous evaluation usually conducted at the vendor's factory or immediately after installation. In this phase, the performance of the instruments is verified against specifications, verifying both stability and precision. The second phase involves the operators in a continuing verification program to ascertain that the instruments are conforming to specifica-

tions. Today's measurement systems supply a wealth of diagnostic information, which is analyzed by statistical techniques such as Shewhart control charts. (Edited author abstract). 7 Refs.

## Sizing

**076358 ALKALINE SIZING BENEFITS BOARD MILL.** GP-Inveresk's Carrongrove board mill in Scotland switched to alkaline sizing in 1986 as part of a three-year investment plan. The change brought both expected and unexpected advantages. A production-related benefit attributed to the alkaline system is better retention. This is reflected in a cleaner whitewater return system and so in reduced levels of effluent discharge. But an unforeseen benefit is that broke recycling is now easier too. This means that there is no longer any of the previous overquenching of the rosin/alum conditions and so no problems of cyclical high/low system pH concentrations.

Hurst, Gerry. *PPI Pulp Pap Int* v 29 n 9 Sep 1987 p 79-80.

**076359 ALUM USE IN ALKALINE AND NEUTRAL SIZING SYSTEMS.** Adding 0.25% to 0.75% alum to alkaline systems improves sizing, drainage, retention (particularly of titanium dioxide) and runnability. While paper permanence brought alkaline papermaking to the fore, other benefits added an economic incentive to go alkaline, especially the strength paper gains when made at neutral or alkaline pH. Stronger paper could be produced, or paper could be made with equivalent strength at reduced cost, through the substitution of filler or less costly fiber. In response, rosin-based sizes have been developed that offer good sizing at neutral or near-neutral pH.

Wortley, Barbara (General Chemical Corp). *PIMA Mag* v 70 n 3 Mar 1988 p 62, 64.

**076360 SIZE PRESS TECHNOLOGY CHANGING TO FACILITATE HIGHER MACHINE SPEEDS.** Sizing technology has evolved to facilitate increased machine speeds. Equipment suppliers comments on the changes made to meet new demands are presented in the article.

Ducey, Michael J. (Pulp & Paper, San Francisco, CA, USA). *Pulp Pap* v 62 n 5 May 1988 p 58-62.

**076361 TRENDS IN SECOND GENERATION AKD SIZING.** The development of second generation polymer stabilized alkyl ketene dimer (AKD) sizes provides improvements over starch stabilized products with respect to retention and rate of cure, overcoming previous drawbacks. Improvements in AKD emulsion technology provides the possibility of transporting a high active solid size with improved stability while offering the flexibility of altering the charge density of the sizing agent. Sizing is often taken for granted, but it has a significant effect on the operating performance of the PM in terms of output and product quality. The article describes the AKD sizing module. It also examines the factors that have resulted in European mills' changeover to alkaline papermaking.

Watson, L.F. (Albright & Wilson Americas, Richmond, VA, USA). *PIMA Mag* v 70 n 9 Sep 1988 p 36-38.

**076362 1987 SIZING SHORT COURSE.** This conference proceedings contains 16 papers. Topics covered include: wetting of paper; sizing test methods; surface sizing; paper sizing starches; aluminum salts in papermaking; fundamentals of sizing with rosin; rosin solution sizes; wet end factors and their influence on the choice of size; machine factors influencing sizing; oil resistance using fluorochemicals; surface sizing using polyurethanes and maleic anhydride polymers; cellulose reactive sizes; principles of ASA sizing; optimizing the ASA sizing process; and, alkyl ketene dimer sizing mechanism. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11252 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

**Slime Control** See Also PAPERMAKING MACHINERY—Maintenance.

**076363 IMPORTANCE OF pH IN CONTROLLING METAL-SOAP DEPOSITION.** Considerable evidence is presented suggesting that the formation of metal soaps, which contribute to pitch deposits, is controlled by the availability of dissolved soap anions which, in turn, is controlled by pH. Concentrations of dissolved soap anions measured in newsprint stocks at various pH values suggest that pH values above 7 will be especially detrimental. However, it is quite possible that metal-soap formation occurs in the presence of dissolved-soap concentrations too small to be measured by our technique. Therefore, a more conservative threshold, such as pH 6, probably constitutes a better guideline for pitch control. The film-deposition and surface-tension evidence in the literature suggests that pH 6 might be a better threshold. In unbleached kraft pulp mills, there is ample evidence that pH less than 6.5 appears to be adequate to suppress metal-soap deposition in the brownstock screen rooms. 17 refs.

**076364 ROLE OF THE LIQUID PLASTICIZING MEDIUM IN INCREASE OF THE STRENGTH OF DRY-FORMED PAPER CONTAINING POLYVINYL ALCOHOL FIBERS.** Estimation of the minimum quantity of water needed for dispersion of cellulosic and binding fibers (at constant temperature) and formation of a paper sheet of high mechanical strength is important both from the practical and from the scientific standpoint. Changes in the physical state of cellulose and PVA, which are partially crystalline polymers during hot water treatment, are directly linked both with disruption of the close packing of the polymeric chains and with additional crystallization. Both kinds of structural conversions may have a significant influence on bond strength in interphase boundary layers. Another purpose of this investigation was to elucidate the role of structural changes at the cellulose-PVA interface in the development of the strength properties of paper. Experimental data show that paper sheet of high mechanical strength can be obtained from unbeaten cellulose with PVA when the binder fibers (in amounts not exceeding 17.5%) are partially plasticized and form adhesions without transition into the viscofluid state. 7 refs.

**076365 DEFECTIVE FIBERS IN WET-LAY NONWOVEN FABRICS.** A defect-free wet-lay nonwoven fabric requires near perfection in both the fiber supply and the formation mechanics of the wet-lay process. This article discusses the different types of fiber defects, examines the fiber or equipment characteristics responsible for creating these defects, and suggests methods for minimizing defect formation. There are three major types of wet-lay nonwoven fabric defects: Logs or sticks - bundles of fibers with aligned cut ends that never dispersed; Dumbbells - paired clumps of fibers connected by one or more long fibers; Ropes - assemblages of fiber, with unaligned ends, that are clearly more agglomerated than the general dispersion. Each defect type has different causes, equipment responses, and remedies. 4 refs.

**076367 PROJECT THUNDER BAY: BRIGHTER NEWSPRINT WITH CLEANER PULP.** The division is gearing up for comprehensive modernizations to its two paper machines (PM) following recent improvements to its pulp operation. The PM upgrades will take full advantage of the better pulp to make higher quality paper which customers demand. PMs 1 and 2 will receive new wet ends designed to run at speeds of about 914 m/min. (3,000 fpm). The machines are currently running at 640 m/min. The mill will install off-machine silos and will modify the chest, couch pit and agitation equipment of both machines. Phases two and three, if approved, will include the installation of new winders.

Karl, Wayne. *Pulp Pap J* v 40 n 4 Apr 1987 p 24-25.

**076368 MACLAREN STARTS UP NEWSPRINT PM.** James MacLaren Industries's new newsprint machine at its Masson mill in Quebec, which started up in 1986, is now running regularly in the 975-m/min range with speed restricted by insufficient pulp capacity. The C\$140-million (\$105-million) 8.4-m trim Beloit machine is the first new PM in North America to be equipped with a Bel Baie III twin-wire former. Equipped with a Converflo headbox, formation is accomplished using slow and gentle water removal using two suction couches, a large-radius forming zone and the absence of foils, eliminating a pumping action. The manufacturing equipment and process is described.

Evans, John. *PPI Pulp Pap Int* v 29 n 4 Apr 1987 p 66-67.

**076369 RETENTION, DRAINAGE, AND FORMATION ON HIGH-SPEED FORMERS.** Outside of the old familiar fourdrinier, modern high-speed formers have basically two classifications. There are gap formers and hybrid formers. Gap formers are true twin-wire formers in which the jet from the headbox is introduced into the drainage zone through a gap formed by two converging wires. In this design, drainage takes place through both wires simultaneously. Hybrid formers combine the fourdrinier with some type of top wire for upward drainage. On high-speed formers, a measure of the drainage capacity is the consistency of the sheet after the couch roll. Most commercial newsprint machines with either a gap former or a true twin-wire have a consistency of 14-17%, depending on the furnish. The mechanism for producing well-formed sheets has an adverse effect on first-pass retention. Shear generated between two wires to reposition fibers also loosens the mat, allowing more fines to be

removed by the drainage flow. Dewatering by vacuum at high speed is an ineffective way to increase dryness after a former. 5 refs.

Hergert, Richard E. (Beloit Corp, Beloit, WI, USA); Harwood, John W. *Tappi J* v 71 n 4 Apr 1988 p 63-66.

**076370 VARIOUS FACTORS AFFECT PRESSURE SCREEN OPERATION AND CAPACITY.** Pressure screens are widely used in pulp mills, secondary fiber processing plants, paper machine approach systems, and broke system applications. Pressure screen design improvements have helped paper machines to be faster and more efficient and to produce higher-quality products. The principle of operation, the flow path through the screen, the operating parameters, the furnish characteristics, and the screen cylinder design parameters are discussed. It is concluded that the challenge for equipment manufacturers today is to design pressure screens that provide the highest capacity while consuming minimal energy and providing the required level of efficiency. The operator can alter variables such as consistency, reject rate, temperature, rotor speed, and pressure drop to improve capacity. Furnish characteristics will also affect screen capacity. 7 Refs.

McCarthy, Christopher (Black Clawson Co, Middletown, OH, USA). *Pulp Pap* v 62 n 9 Sep 1988 p 233-237.

**076371 GULF STATES COMPLETE MAJOR COATER REBUILD ON NO. 1 PAPER MACHINE.** The paper machine rebuild involved the fourdrinier, press section, dryer section, coater section, winder, and peripheral equipment. The original fourdrinier had an all-roll forming table, which was converted to an all-foil table as part of the rebuild. However, some rolls were retained to give the wire 'some action' and thus enhance the formation. The 24-in.-dia dandy roll, from Plank, was replaced with a 48-in.-dia roll. A devronizer steambox from Devron Hercules was installed between the dandy roll and lumbbreaker roll. A modification of the fourdrinier differential drive increased its horsepower. The new press section consists of two presses and the smoothing press. The third press was removed and the smoothing press relocated. The dryer section of the machine consists of seventy-nine 60-in.-dia dryer cylinders divided into five sections. The new coater section, with its two Beloit coaters, is designed to coat both sides of the sheet. A third coater applies additional coating to enhance ink holdout for sharp image printing. The upgrading of peripheral equipment is outlined.

Anon. *Pulp Pap* v 62 n 10 Oct 1988 p 129-131.

**076372 1987 PRACTICAL ASPECTS OF PRESSING AND DRYING SEMINAR.** This conference proceedings contains 26 papers dealing with pressing and drying in papermaking. Covered are topics such as papermaking press design; effect of pressing on sheet two-sidedness; wet pressing-reheated sheet stratification; paper defects due to fluid shear force in pressing; vacuum system for the press section; press felt performance; press vibration analysis; shower system design; press roll covers; press accessories; dryer section operation; hot pressing; moisture control; paper machine dryer testing; modern dryer fabric design; steam heated dryers; and dryer fabric installation. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11105 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

Anon (TAPPI, Atlanta, GA, USA). *TAPPI Notes* 1987 Pract Aspects of Pressing and Drying Semin, Geneva, Switz Mar 16-20 1987. Publ by TAPPI Press, Atlanta, GA, USA, 1987 262p.

**076373 1987 TWIN-WIRE SEMINAR.** This conference proceedings contains 19 papers of which one paper appears in abstract form only. Papermaking machinery and applications are covered. Some of the topics discussed include papermaking quality control; printing properties and physical properties of paper; paper sheet formation; drainage systems; twin-wire paper formers; headbox design; and fourdrinier machines. Technical and professional

papers from this conference are indexed and abstracted with the conference code no. 11277 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

Anon (TAPPI, Atlanta, GA, USA). *TAPPI Notes* 1987 Twin-Wire Semin, Atlanta, GA, USA, Apr 8-10 1987. Publ by TAPPI, Atlanta, GA, USA, 1987 179p.

**Applications** See PAPERMAKING—Coating.

**Automation** See Also PAPERMAKING—Finishing.

**076374 CONTROL IMPROVEMENTS AND AUTOMATION CAN IMPROVE ROLL QUALITY AND WINDER PRODUCTIVITY.** One Beloit two-drum winder was installed to process all of the production in the new, 600-ton/day, lightweight coated paper mill at Bowater Carolina Co. A winder operator and two helpers run the winder, process orders, number and label finished rolls of paper sent to be wrapped, and throw broke into the repulper. To keep the winder from being a production bottleneck, it was designed to produce top-quality rolls at high speed. It was also designed to allow quick adjustment of winding parameters to accommodate frequent grade changes. Unproductive winder time for set and reel changes had to be minimized, and the time required to change orders had to be cut as much as possible.

Riordan, P.D. (Bowater Carolina Co, Catawba, SC, USA). *Tappi J* v 70 n 10 Oct 1987 p 73-75.

**076375 WHAT YOU SHOULD KNOW ABOUT ROPE SYSTEMS AND AUTOMATIC TRANSFERS.** The authors examined several papermaking machines (PMs) at Mead Paper Corp.'s Chillicothe, Ohio, mill and made several interesting and important discoveries that are commonplace today on most of the industry's PMs. On the slower, smaller machines, for instance, the main contributing factor to lost time associated with ropes was due to improper transfer, sheave sizing and alignment. The PMs examined ranged in speed from 1000 to 2000 fpm and produced various grades of carbonless. As the speeds continued to increase above 1000 fpm, automatic transfers were found to be very desirable, yielding improved operating condition and less downtime.

Diltz, Jack (Westpatt Inc, Springfield, OH, USA); Hamler, John. *PIMA Mag* v 70 n 5 May 1988 p 21, 24-26.

**Bearings**

**076376 INCREASED CAPACITY OF A FINNISH PAPER MAKING MACHINE.** The Finnish paper mill Veitsiluoto Oy in Kemi, Finland, put into operation a papermaking machine which was completely modernized and equipped with FAG rolling bearings. As a result of this modernization, the web speed of the machine was increased from 750 to 1200 metres per minute. This corresponds to a daily output of 280 tons of base paper. All rolling bearings were replaced during the conversion. The majority of bearings are spherical roller bearings varying in size from 45 to 360 mm bore diameter. The setup and properties of some typical bearing arrangements are described.

Lehtonen, Jorma (FAG Helsinki, Finl); Schmieder, Hubert. *Ball Roller Bear Eng* 1985 p 20-23.

**076377 SHOCK PULSE MEASUREMENT SAVES MILLIONS FOR SWEDISH PAPER MILLS.** In order to reduce the risk of bearing breakdowns and other production disturbances, all bearings in the papermaking machinery (PM), as well as those in vital auxiliary equipment such as pumps, gear boxes and electric motors, are checked once a month. The inspections are carried out by staff at the maintenance department, who have several modern technical aids at their disposal. Damage to rolling element bearings can be detected by shock measuring with the shock pulse measurement (SPM) method. In addition, by using electronic stethoscopes, other mechanical faults can also be detected. Thus, every machine in the mill has fixed adapters or permanently installed transducers.

Nystrom, Robert (Industrial News Service). *PIMA Mag*

v 70 n 3 Mar 1988 p 22-23, 26.

**076378 BRUSH POLISHING OF COATED BOARD AND SUPERCALENDERED COATED PAPERS.** The brush polishing process is an economical technique in improving certain surface properties and is currently used with supercalenders and gloss calenders. A gloss calender is a unit with one or two passages of paper through one or two nips between a normally rubber-coated roller and a heated cylinder with a highly polished surface. Brush polishers are working nowadays in line with linerboard machines and their gloss calenders, or in line with supercalenders.

Pleines, Hanns D. (DOX W. Dossmann Nachf, Dreieich, West Ger). *Tappi J* v 71 n 3 Mar 1988 p 125-128.

**076379 ON-LINE MEASUREMENT/CONTROL FOR SUPERCALENDERS: AN UPDATE.** Because the supercalender traditionally represents the last opportunity to inspect the finished product, a number of on-line sensors are used solely to monitor and document key product characteristics. These sensors have included: basis weight; moisture; color; brightness; opacity; and flaw detection. Other sensors measure and control key product variables including: caliper; smoothness; gloss; moisture; temperature; and roll hardness.

**Computer Applications**

**076381 MODERN CORE CUTTING TECHNOLOGY REDUCES WASTE, BOOSTS EFFICIENCY.** The introduction of programmable core cutters provided a means of reducing some of the waste generated in a decentralized system. An example of this concept is the Menasha P500 programmable core cutter which allows the operator to easily cut cores of varying lengths from a single parent core, thereby increasing the probability that most of the core can be cut into usable lengths. Recently, Menasha Corp. introduced a programmable core cutter for long parent cores that provides a knife cut. The P600 programmable core cutter can be built in a length that matches the mill's longest parent core requirement. The P600 is a fully integrated system that can provide sets of cores that are cut, identified and loaded for transfer to the core user.

**076384 ANATOMY OF A ROLL-TRACKING SYSTEM.** At the heart of the Production Management System (PMS) of a paper mill is a stratus fault-tolerant XA-600 32-bit computer with 12 million bytes (MB) of main memory, two 448-MB hard disks, and a tape drive. The trim clerk has the MAJQTRIM software package at his disposal with which to trim each of the five newsprint PMS. The new system includes a link between the Majiq PMS software and the Mesureux computer control system. A laser scanner at the first station of the main wrapping line identifies the roll to the system. A storage bay allocation algorithm automatically assigns rolls to storage bays in the warehouse. A complete set of production reports is produced by the system daily.

**Control Systems** See Also PAPER—Calendering; PAPER—Coating; PAPERMAKING—Coloring.

**076385 DYNAMIC SIMULATION FOR EFFICIENT PAPER MACHINE GRADE CHANGE.** It is important to minimize losses resulting from grade changes on a paper machine. The extent of these losses depends on the time required for the new furnish to settle down in the system. The speed of this process is affected by numerous variables. A computer model is presented which can quantitatively simulate the complex dynamic phenomena that occur during grade-change operations. These simulated results can then be displayed visually in powerful computer graphics. Operational parameters such as chest volumes, first-pass retention, and broke ratio are crucial factors that largely determine the extent of grade-change loss. Better management techniques can be induced from the simulated results. It is likely that the System Dynamics approach will prove to be a useful system-analysis tool in other applications. 6 refs.

**076389 INITIAL OPERATING TRIALS OF A DANDY ROLL FORMER.** Papermakers have long referred to top-wire formers as oversized dandy rolls. Virtually all of the stock redispersion and sheet formation occurs in the former's entry nip and in the first 20-30' of wrap of the two fabrics around the forming roll. The rest of the top-wire's complex and costly superstructure serves strictly to transport the formed sheet to the couch roll and to control the travel of the top fabric. In a newly patented design it was decided to wrap a conventional large-diameter dandy roll for about 40' of its circumference with the fourdrinier fabric, locate a suction box at the point of separation of the fabric and roll, and employ a roll or two to bring the fabric to the couch roll thus eliminating the top fabric. Running at speeds between 800 and 2800 ft/min, the design functioned well. (Edited author abstract)

Kallmes, Otto J. (M/K Systems Inc, Danvers, MA, USA); Langdok, R. *Tappi J* v 71 n 4 Apr 1988 p 73-76.

**076390 REDUCING RETROFIT RETROGRESSION.** Realizing that twin-wire dewatering makes it possible to get extra dryness to the press section with less sheet destruction, why is this advantage ignored? To encourage the correction of this oversight, the consistencies were examined of the sheet entering and leaving the nip of a single-wire machine. The retrofit has three parts: a flat wire dewatering portion; a twin-wire dewatering portion; and a final flat wire dewatering portion leading to the drilled couch. The drilled couch also received critical examination. (Edited author abstract). 5 refs.

**076391 DIRECT DRIVE SYSTEMS FOR SHEETERS: PULSE-WIDTH MODULATED VS. SILICON-CONTROLLED RECTIFIER DRIVES.** Direct-driven sheeters systems have typically consisted of two dc motors and silicon-controlled rectifier (SCR) drives. The two motors that are directly coupled are the draw or pull roll drum and the cutter or knife drum. These two motors are controlled with a processor or a combination of processors with varying capabilities. Ever-improving processor technologies have increased the user's ability to implement sophisticated control schemes, improving the response to system torque disturbances such as out-of-round stock rolls. A pulse-width-modulated (PWM) drive offers even more improvements. With a

PWM drive, transistors are used as gating devices. These transistors can be turned on and off at relatively high frequencies, most often at 1000-3000 times/s. The benefits and features of both a dc PWM and dc SCR drive are discussed as they apply to the operation of a sheeter.

**076395 LINERBOARD DRYING: MODEL DEVELOPMENT AND HEAT TRANSFER COEFFICIENT DETERMINATION.** New computer software has been developed to model a complete paper machine dryer system. Unit operations models and physical property models necessary to simulate the steam, condensate and air flows throughout the entire dryer system have been incorporated into GEMS, the modular computer software system for mass and energy balance calculations. Simulation results for the dryer section of a linerboard machine are reported in this paper. The models are verified against actual mill data both before and after the installation of a Beloit extended nip press (ENP). Changes in operating conditions resulting from the ENP installation are discussed. Heat transfer coefficient determination is also discussed at length. (Author abstract) 24 refs.

**076396 OPTIMIZATION OF THE GEOMETRICAL PARAMETERS OF ELEMENTS OF PAPERMAKING MACHINES.** When designing the drying section of a papermaking machine based on the traditional

arrangement of the drying drums it is very important to select not only the geometrical parameters of the individual blocks with account of their strength, rigidity, resistance to vibrations, and reliability, but also the correlation of the parameters at which the metal requirement of the drying section is at a minimum. The authors propose a graphical analytical method for the determination of the geometrical parameters of the equipment, based on the minimization of the metal requirement for the drying section, makes it possible to reduce the mass by 10-12%; this corresponds to a saving of 100-150 tons of metal. The method can also be applied successfully to calendars, presses, and other blocks of papermaking machines. 3 refs.

**076397 SURVEY OF CANADIAN NEWSPRINT DRYER SECTIONS: PART II - ENERGY CONSUMPTION AND DRYING RATE.** A survey of 92 dryer sections of newsprint and groundwood specialty paper machines at 30 Canadian mills was carried out in 1985. This report examines the energy consumption patterns and the overall drying rates in these units. The average steam consumption was 2.9 kg steam/kg finished product, and 1.5 kg steam/kg water evaporated. Many of the dryer sections were inadequately instrumented, and it appears that the potential for heat recovery from the hood exhaust remains largely underutilized. (Author abstract) 4 refs.

**076399 TODAY'S DRYER SECTION: AN OVERVIEW.** Sheet instability in the dryer section is the limiting factor to increasing machine speed on many high-speed, lightweight PMs. Devices have been developed to stabilize the sheet in its travel from the last press to the reel, permitting speeds in excess of 4,000 fpm. Steam and condensate systems have also been re-designed to minimize sheet disturbance, particularly on wet-end dryers. Hoods have been re-designed to make them vapor tight and capable of operation at high exhaust humidities for better sheet stability without sweating or vapor spill to the room. Other developments include: press run blow boxes; single top/bottom felting; higher machine speeds; transfer between drive sections; pocket ventilation.

Chalmers, G.J. (Valmen-Enerdry, Knoxville, TN, USA). *PIMA Mag* v 70 n 6 Jun 1988 p 45-46, 49-51.

**076400 PLASMA-SPRAYED COATING HELPS SAVE YANKEE DRYER FROM THE SCRAP PILE.** In 1984 a yankee dryer at Georgia-Pacific Corp.'s tissue mill in Bellingham, Wash., had worn so thin that mill managers were ready to replace the unit - a procedure that would have meant extensive capital expenditures. After trying other ways of repairing the dryer, the mill turned to Bender Machine Services Inc., which promised the unit would be running in less than two weeks through the use of a new coating process called PS500. Bender's PS500 coating is a plasma-sprayed blend of molybdenum with a nickel alloy applied by Bender technicians at the plant. After 34 months of continuous service, the coating applied to a finished thickness of 0.031 in. has shown wear of 0.002 in.

Anon. *Pulp Pap* v 62 n 6 Jun 1988 p 118-119.

**076401 HUMIDITY AND ITS EFFECT ON THERMAL EFFICIENCY OF YANKEE HOODS.** During the tissue-drying operation, heat is transferred to the sheet by both the Yankee cylinder and the hood air system. Air-side drying rates have improved significantly in recent

years, and the Yankee hood has developed to the point that it can handle over 80 percent of the drying load. The highest production rates and energy efficiencies are achieved through optimum design and operation of the air system.

Schukow, Vic (Flakt Ross Inc, Lasalle, Que, Can); Heberl, Andy. *Tappi J* v 71 n 7 Jul 1988 p 68-70.

**076402 CHAMPION FINDS SHEET BREAK DETECTOR THAT IS EFFECTIVE IN DRYER SECTIONS.** A description is given of a photoelectric infrared sensing detection system which was designed to be able to withstand the high temperatures and dirty environment of the dryer section. The infrared sensors are comprised of strands of glass fiber-optics bundled together into probes that can withstand temperatures up to 260°C (500°F). The probes are connected to a thermally protected amplifier card and a relay control logic card at a remote location up to 100 ft away. This configuration allows the sensor probes to be located inside the dryer hood and the control electronics to be located outside the dryer hood, away from the heat. Two fiber-optic probes achieve the sensing of paper in proximity by using one probe to send a pulse-modulated infrared signal out and the other probe to receive the signal. The two probes are mounted next to each other approximately 2 in. apart and 3 in. above the running sheet of paper. This configuration helps to prevent a false reading from forcing particles such as dust, oil, or paper that can cover or partially block the surface of a probe. A technique to calibrate the sensitivity of the sensors is discussed.

Harrison, Andy (Pulp & Paper, San Francisco, CA, USA). *Pulp Pap* v 62 n 10 Oct 1988 p 110-112.

**076403 1986 PRACTICAL ASPECTS OF PRESSING AND DRYING SEMINAR.** This seminar proceedings contains 27 papers. The topics discussed are: press design; influence of pressing on sheet two-sidedness; roll cover design in press sections; rolls maintenance; press felt/sheet profile management; vacuum systems for presses; sheet stratification; fluid shear force during pressing; press-felt system optimization; press vibration; wet pressing; hot pressing; dryer troubleshooting; infrared heating; non-contamination control techniques for paper machine lubricating/hydraulic systems; air systems in dryers; paper machine hoods, pocket ventilation, heat recovery; spoiler bars; steam condensate; nondestructive dryer testing; dryer fabric installation, guiding and troubleshooting. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 10877 in the Ei Engineering Meeting (TM) database produced by Engineering Information, Inc.

#### Electric Drive

**076404 TRENDS IN EUROPEAN PAPER MACHINE DRIVE TECHNOLOGY.** Most of the new paper machine installations and rebuilds in Europe are using sectional-drive systems. Digital/numerical control technology is now the accepted standard, with sectional ac making up almost 50% of all new installations. It appears that the application of drive technology on European paper machines has advanced at a faster rate than in North America. Many of the practices that are considered commonplace in Europe are now beginning to find acceptance elsewhere. These practices include the use of drop-in stations, color graphics, group transformers, and sectional ac drives.

Curtis, J.W. (Allen-Bradley/Stromberg Inc, Cedarburg, WI, USA); Haatainen, Juhani. *Tappi J* v 71 n 1 Jan 1988 p 44-48.

**076405 CALCULATION OF ENERGY REQUIREMENTS FOR A PAPER MACHINE DRIVE REBUILD.** Nekoosa Papers' No. 4 paper machine was installed in 1900. Major rebuilds in 1954 and 1972

brought running speed up to 1200 ft/min. As with many paper machine drives, this machine was powered by a steam-turbine-driven lineshaft. The machine trims 108-114 in. at the reel and runs basis weights of 8-36 lb (1300 ft<sup>2</sup> basis). The steam-driven lineshaft was removed during a rebuild in 1986 and was replaced by a sectional electric drive with felt-roll drive. The machine is geared for 1800 ft/min. The mill's experience in changing the drive system on a 128-in. Fine paper machine from a steam-turbine-driven lineshaft to a sectional electric drive is presented. 3 refs.

#### Felts

**076408 REWETTING IN THE EXPANSION SIDE OF PRESS NIPS.** The University of Maine Compression Tester has been modified so that water removal from the sheet can be measured directly. A comparison between this direct measurement and water removed based on thickness measurements indicates that as much as 30% of the total water removed in pressing is returned as rewet in the expansion side of the nip. A systematic study of this difference indicates that 'rewet in the nip' is directly proportional to the total water removed, is strongly influenced by the permeabilities of both the sheet and the pressing media, and has a complex relationship with the expansion time on the exit side of the nip. Model studies suggest that rewet in the nip could be reduced by providing more effective ways for air to reach the interface between the sheet and the pressing media. (Author abstract) 4 refs.

**076410 SIMPLE MAINTENANCE PROCEDURES CAN HELP EXTEND FORMING FABRIC LIFE. CLOTHING COSTS CAN BE SIGNIFICANTLY REDUCED THROUGH PROPER PREVENTIVE MAINTENANCE; GUIDELINES FOR REGULAR INSPECTIONS ARE OFFERED.** Optimizing forming fabric life, thereby reducing machine clothing costs, is easily achieved by preventive maintenance and a good understanding of the care and handling of fabrics. This article discusses how the proper maintenance of forming fabrics, and of the machine as it relates to fabrics, can increase fabric life and productivity. The article discusses how periodic checks of the machine can maximize fabric life and machine performance. It also discusses how proper care and handling can increase a fabric's useful life.

Houfek, William E. (Wisconsin Wires Inc, Appleton, WI, USA). *Pulp Pap* v 62 n 4 Apr 1988 p 163-164.

**076411 HOW TO MAINTAIN SYNTHETIC FORMING FABRICS.** The author discusses how the proper maintenance of forming fabrics and of the papermaking machinery (PM) as it relates to fabrics, can increase fabric life and productivity. He also discusses how periodic PM checks can maximize PM performance. He also shows how proper care and handling can increase a fabric's useful life.

Houfek, William E. (Wisconsin Wires Inc, Appleton, WI, USA). *PIMA Mag* v 70 n 5 May 1988 p 17-18.

**076412 NEW TOP FELT SYSTEM AT PORT HUDSON HIKES DAILY PRODUCTION 9%.** To obtain more production from its pulp machine at the Port Hudson, La., mill, Georgia-Pacific Corp. installed a top felt on the first press section. By incorporating existing surplus components with new equipment, a design was developed that cut equipment costs by 50 percent. The system was engineered and fabricated within four months at Mill Services' Hattiesburg, Miss., plant. The complete unit was then shipped to the mill in large segments to reduce installation costs. Improved dryer efficiencies have raised hourly production rates from 47 tph to 53 tph - an average daily increase of 140 tons, or 9 percent.

Anon. *PIMA Mag* v 70 n 10 Oct 1988 p 14-15.

**Fourdrinier Machines** See Also PAPER—Newsprint; PAPER—Sheeting; PAPER AND PULP MILLS—Korea; PAPERMAKING—Coating.

**076413 COMPUTATIONAL MODEL FOR WATER DRAINAGE IN FOURDRINIER PAPER MACHINES.** A computational model based on Taylor's equation and the filtration equation was developed to evaluate the location of the wet line (5% consistency) on fourdrinier paper machines. Drainage at table rolls and low-vacuum elements was evaluated by the model. Comparison of the results obtained using the drainage model and by measuring the consistency profile in paper machines presented an agreement within 10%. The value of the specific filtration resistance used in the model was determined by means of experimental runs in a modified laboratory drainage and vacuum retention tester. This device measures dynamic specific filtration resistance, which is different from the constant pressure or constant flow approaches used in the past. (Author abstract) 11 refs.

Pires, Eduardo C. (Univ of Sao Paulo, Brazil); Springer, Allan M.; Kumar, Vinod. *Tappi J* v 71 n 4 Apr 1988 p 133-139.

**076414 MILL USES PORTABLE STROBE LIGHT TO FINE-TUNE SPECIAL DEWATERING BLADE.** Flambeau Paper installed a lightweight, portable strobe light on its No. 3 paper machine in Park Falls, Wis. Formation data collected from this unit was used to help install and align a new dewatering blade. The 20-lb strobe light, made by Unilux Inc., emits continuous pulses for blur-free inspection of a fourdrinier section. Analysis of formation data showed the blade could be aligned to impart even dewatering, helping boost product uniformity and retain raw materials. Since alignment, the blade has been performing in a manner comparable to vacuum foils.

By allowing exact formation analysis, a lightweight, continuous pulsing unit helps Flambeau Paper optimize new fourdrinier foil.

Anon. *Pulp Pap* v 62 n 4 Apr 1988 p 124-125.

**076415 EFFECT OF PIGMENT PROPERTIES ON THE WEAR OF PLASTIC FOURDRINIER WIRE.** The new modified Einlechner abrasion tester has been used to determine the effects of particle size, size distribution, shape, and composition of six different filler pigments on the wear of two different kinds of plastic fourdrinier wire. The new abrasion tester closely resembles the physical condition on a paper machine and has been shown to correlate with plastic wire life on European papermaking equipment. The results suggest that pigment composition may be more important than size, shape, or particle size distribution in determining wire life. In addition, the chemical composition of the wire affects the abrasiveness of different pigments. These results and their practical significance to the papermaker are interpreted in the light of modern theory. (Author abstract) 13 refs.

Hemstock, G.A. (Engelhard Corp, Edison, NJ, USA); Neubold, H.B. *Tappi J* v 71 n 5 May 1988 p 127-132.

**076416 PAPERMAKING - GOOD RESULTS WITH TWINFORMER.** The Escher Wyss Twinformer presented here has been engineered to meet the needs of papermakers and paper processors. It enables equal-sided papers (e.g. writing and printing grades) to be produced with improved formation and lower raw material costs. (Author abstract)

**Headbox** See Also FLOW OF FLUIDS—Suspensions.

**076418 MULTILAYER HEADBOX FOR PRINTING PAPER.** Multiply technology has tremendous potential for the makers of printing grades - in cost savings and improved product quality. A layered, 80gsm paper is, for example, \$26 a ton cheaper to make than a similar mixed paper. It is possible to reduce the basis weight of a layered paper without reducing stiffness. Layering enables a papermaker to engineer his end product - to place fiber in filler in the best possible place and thereby optimize the surface and the interior of the sheet. This article describes the latest multiply technology, which was developed specifically for lighter grades. (Edited author abstract)

Stenberg, Gunmar (VALMET-KMW, Finl). *Pap Technol Ind* v 28 n 6 Sep 1987 p 582-588.

**076419 DEMANDING CUSTOMERS HAVE MEANT DRAMATIC CHANGES IN HEADBOXES.** Headboxes and flow approach systems have been drastically changed to meet the higher demands placed on the PM by the product's end users. This article traces the development of technically sophisticated papermaking machinery.

Newcombe, Doug (Consultants Inc, Appleton, WI, USA). *PIMA Mag* v 69 n 10 Oct 1987 p 27-29, 32-34.

**076420 NEW DEVELOPMENT ON THE STEP**

**DIFFUSOR HEADBOX.** The approach flow in the papermaking process consists of a process-dynamic system of individual operations serving to deliver a suspension of defined consistency, purity and homogeneity to the headbox. In the proven PE System, which precedes every ESCHER WYSS headbox for Fourdrinier machines and thus constitutes part of the headbox system, the absorption and reflection damping principles are combined ingeniously to assure a high degree of pulsation damping. Another essential task performed by the objective design is optimal hydraulic guidance of the total stock flow to the headbox. Segregation of the pulsation damping function from the headbox functions and consequence prevention of interactive influences results in a maximum damping effect, since the entire stock flow is involved and not just an overflow or part flow in the region of the headbox. (Edited author abstract) 1 ref.

Kurtz, R. (Sulzer Bros Ltd, Winterthur, Switz). *Sulzer Tech Rev* v 69 n 4 1987 p 27-30.

**076421 HOW HEADBOX DESIGN AND OPERATING CRITERIA AFFECT MACHINE PERFORMANCE AND SHEET STRUCTURE.** Headboxes require proper set-up for peak and proper performance to produce a good quality, competitive product. The expanded Papyrus headbox slice/flow dynamics computer program is a scientific tool to examine, characterize, and optimize any headbox operation at the mill site with virtually no or minimum capital investment. 6 refs.

Ibrahim, Ahmed A. (Papyrus Inc, Westerville, OH, USA). *Pulp Pap Can* v 88 n 12 Dec 1987 p 33-34, 36-37.

**076422 SLICE LIP AUTOMATION.** Automation of the headbox slice lip for CD weight control is a more complex subject than is commonly realized. Points to consider in a systematic approach are discussed. Mechanization of the slice lip for remote or automatic control is described in detail. (Author abstract) 5 refs.

Cutshall, K.A. (Devron-Hercules Inc, North Vancouver, BC, Can); Hamel, R.G. *Pulp Pap Can* v 89 n 1 Jan 1988 p 85-88, 90-92.

**076423 HOW HEADBOX DESIGN AFFECTS PM PERFORMANCE AND SHEET STRUCTURE.** Headboxes require proper setup for peak performance to produce a quality product. Complex headbox process parameters are interactive and should be calculated according to the laws of physics as opposed to trial and error. This guarantees accurate, measurable and predictable information. Adjustments can then be applied. The Papyrus Headbox Slice/Flow Dynamics computer program in its newly expanded version is indispensable for examining, characterizing and optimizing any headbox operation with little or no capital investment.

Ibrahim, Ahmed A. (Papyrus Inc, Westerville, OH, USA). *PIMA Mag* v 70 n 1 Jan 1988 p 28-31.

**076424 THREE-LAYERS GIVE MANY POSSIBILITIES.** Fine paper producer Munkedal has recently started its new three-layer headbox, the first in the world on printing and writing grades. So far, the results are encouraging. The new Valmet-KMW three-layer headbox is really three individual headboxes on top of each other. Each layer has its own screening system and fan pump, with the layers separated by thin plastic vanes. As the three jets leave the nozzles, they are kept away from each other by means of an air wedge between each layer. The air wedges keep the layers from intermixing, until they are trapped by the two converging wires. This design assures a very good separation.

O'Brian, Hugh. *PPI Pulp Pap Int* v 29 n 4 Apr 1987 p 73-74.

**076425 INFLUENCE OF HEADBOX FLOW CONDITIONS ON PAPER PROPERTIES AND THEIR CONSTANCY.** Certain design parameters and operating conditions of the headbox lead to flow conditions at the slice and on the wire resulting in a displacement of the

main fiber orientation in the xy-plane away from the machine direction. For some paper grades, this means potential problems in subsequent converting operations and in product end use (diagonal curl). The phenomenon is explained by a simple fluid model. Results from tests with commercially installed Step Diffuser headboxes are reported. These tests showed the effect of variations in distributor overflow and local slice bar adjustment on local main fiber orientation across the machine. Results of measures in both headbox design and in facilitating operation show distinct improvements in fiber orientation. (Author abstract) 10 refs.

## Lubrication

**076426 PM OILS; THEY'RE CRITICAL TO RELIABLE, EFFICIENT OPERATION.** One of the most critical aspects in maintaining the reliability of today's modern PM is selecting a high-quality oil to lubricate key machine elements. The effect of improper lubricant selection can be significant. In many cases, the loss of critical bearing can cause unscheduled downtime (always when it's most inconvenient), resulting in a loss of production and hiking PM operating costs. This paper reviews the properties of PM oils specially formulated for unique requirement of the mill environment.

Dietz, Thomas G. (Exxon Co, Houston, TX, USA). *PIMA Mag* v 70 n 1 Jan 1988 p 24, 25-27.

**Maintenance** See Also PAPER AND PULP MILLS—Auxiliary Equipment; PAPER AND PULP MILLS—Maintenance.

**076427 RETENTION, DRAINAGE AND PITCH CONTROL WITH ALUM.** Alum is an effective retention agent in moderate-speed papermaking machineries (PM). Alum provides the least costly cationicity. High molecular weight, longchain length polymers provide the most shear resistant retention mechanisms. Controlled trials must be initiated to determine the optimal combination for each PM. Alum enhances drainage by neutralizing the usual anionic surface charge of furnish components. Water release increases as the isoelectric point (zero charge) is approached. Alum has long helped alleviate pitch problems. The alumina floc entraps the resinous material and deposits it on the fiber surface through many of the same mechanisms involved in paper sizing.

Wortley, Barbara (General Chemical Corp, Syracuse, NY, USA). *PIMA Mag* v 70 n 4 Apr 1988 p 42-43.

**076428 COVERED ROLL MAINTENANCE.** The author considers covered roll maintenance in a broad sense. The study includes a short description of cover design, roll-handling and crowing, chemical resistance of cover materials and various paper machine operating factors which influence cover life. Suggestions are included for obtaining the maximum operating life of covered rolls with an efficient maintenance program. (Edited author abstract). 1 Ref.

## Mixers

**076429 MEDIUM CONSISTENCY CHLORINATION IN A LABORATORY MIXER.** A batch laboratory mixer for treating medium consistency pulp in a fluidized state with bleaching gases and solutions has been built. Medium consistency chlorination has been systematically compared to low consistency chlorination. With respect to delignification, 10 PERCENT consistency chlorination at 50°C in the laboratory mixer was only slightly more efficient than 3 PERCENT consistency chlorination under the same conditions. There was little effect of consistency on shive removal or pulp strength.

High-intensity mixing was shown to improve shive removal. (Author abstract). 19 Refs.

Reeve, D.W. (Univ of Toronto, Toronto, Ont, Can); Earl, P.F.; Gullichsen, J.; Pu, C.M.; Magued, A.; Rapson, W.H. *Pulp Pap Can* v 89 n 6 Jun 1988 p 115-120.

## Nondestructive Examination

**076430 SPECIALIZED NDT HELIUM LEAK DETECTION.** Helium mass spectrometer leak detection is a relatively new method of non-destructive testing. The highly corrosive environment in the pulp and paper industry, combined with industrial, and environmental health and safety regulations has prompted industry to develop technology to locate and evaluate the size of leaks on location. This enables mill personnel to repair defective areas during regular maintenance scheduled shutdown periods. The purpose of helium leak testing is to minimize risks to mill personnel and neighbouring residents. It also avoids costly unscheduled downtime due to lost production through untimely leaks. (Edited author abstract). 1 Ref.

Kitchen, G. (A&I Inspection Services Ltd, Cambridge, Ont, Can). *Pulp Pap Can* v 89 n 6 Jun 1988 p 96-99.

## Performance

**076431 ANALYSIS OF PAPER MACHINE PERFORMANCE.** Quality specifications have grown more demanding as paper products customers strive to obtain maximum output from their converting operations. Prior to the introduction of cross-machine control, reject criteria of paper products were based largely on analyses of machine-direction (MD) variation. With the advent of cross-direction (CD) control, the more stringent quality specifications demanded by customers are now achievable. The first step in performance analysis is the robust acquisition of raw data. For paper machines, the raw data consist of variables such as basis weight, moisture content, and caliper. These variables are band-limited by analog filtering and are then sampled temporally and/or spatially at a frequency consistent with Shannon's sampling theorem. Analytical methods to determine the feasibility of CD control, evaluate current machine performance, and locate sources of process variation are described. 8 refs.

Saucier, Michael F. (Combustion Engineering, Columbus, OH, USA); Steinkirchner, Alan D. *Tappi J* v 71 n 4 Apr 1988 p 97-102.

**076432 SMOOTH START FOR WIDEST LWC PM.** With a wire width of 9.1 m, United Paper Mills new PM 6 at Kaipala in Finland is the world's widest LWC line. Its output - about 200,000 tons/yr - is destined mainly for EEC markets. In this article the author reports on the 9.1-m wide PM. The main topics are the mechanical pulp used, coaters, rotogravure printers, and roll wrapping and labelling.

Pearson, John. *PPI Pulp Pap Int* v 30 n 5 May 1988 p 43-45, 47.

## Plastics Parts

**076433 CANADIAN MILLS SOLVE CORROSION PROBLEMS WITH FRP.** A key tool in Fiberglass Canada's customer service program is 'Superlam', a computer software program for the designing and testing of reinforced plastic laminants. The menu-driven program makes it possible to design laminates suitable for the large storage tanks, processing vessels, pollution control equipment and large-diameter pipelines required by pulp and paper mills. After a laminate has been built up layer by layer on the computer, it can then be 'tested' again on the computer under the appropriate loading conditions to determine the stresses and strains in each layer. The laminate analysis program is based on a theory which assumes each lamina in a laminate is in a plane stress state.

Kesterton, Mike (Fiberglass RP Report, Toronto, Ont, Can). *Pulp Pap Can* v 89 n 5 May 1988 p 17-19.

## Protection

**076434 PITCH DEPOSITION IN PAPERMAKING AND THE FUNCTION OF PITCH-CONTROL AGENTS.** Dispersed synthetic pitch was deposited by inducing shearing forces. The deposition tendency of two types of pitch was evaluated with regard to the influence of temperature, water hardness, pH, concentration, and fiber consistency. The effect of pitch-control agents (alum, talc, and three polymers) on the extent of deposit formation was then studied. The conditions required for deposition and the extent of deposit formation were dependent on the composition of the dispersed pitch. Certain pitch-control agents profoundly reduced pitch deposition, with Darasperse cationic polymers being the most effective. A mechanism by which such polymers work is suggested. (Author abstract) 25 refs.

## Retrofitting

**076435 UNION BRUK SPEEDS INTO THE FUTURE.** A new twin-wire former has raised both quality and speed on Union's PM 7 at Skien, Norway, in the first step in a three-year development program. (Author abstract)

O'Brian, Hugh. *PPI Pulp Pap Int* v 30 n 4 Apr 1988 p 52-54.

**076436 NANPING REBUILDS NEWSPRINT PM 1.** Located in Fujian province, Nanping newsprint mill, has completed a rebuild of 3.2-m trim PM 1, raising speed from 320 m/min to 500 m/min. Mill director describes how the rebuild was carried out. (Edited author abstract)

Anon. *PPI Pulp Pap Int* v 30 n 4 Apr 1988 p 59.

**Rolls** See Also MECHANISMS—Stability; PAPERMAKING—Quality Control; PAPERMAKING—Sizing; ROLLS—Failure.

**076437 WINDER TECHNOLOGY FOR PRODUCING LARGE ROLLS OF HIGH-DENSITY COATED PAPER.** While the strength of base papers is being reduced, roll diameters and the width of printing presses are increasing. These trends have made roll structure and roll quality of coated papers increasingly vital issues for the printer. The use of coated paper in the production of finished rolls adds another level of complexity to this process and presents some special problems. This paper formulates strategies for solving these problems by examining them one at a time. 3 refs.

Schikorra, Gert E. (Jagenberg Inc, Enfield, CT, USA). *Tappi J* v 70 n 10 Oct 1987 p 53-57.

**076438 PRACTICAL EXPERIENCES WITH THE KUFFERATH DANDY ROLL FORMER AKUMAT.** Dandy rolls improve formation, retrofit hybrid formers increase drainage capacity. The dandy roll former AKUMAT does both, and it can be installed without any irreversible modifications to the fourdrinier. AKUMAT dandy roll formers in the U.S.A., U.K., Europe and the Far East are witnesses to these claims. (Edited author abstract) 5 refs.

Holle, D. (Andreas Kufferath GmbH & Co, Dueren-Mariaweller, West Ger). *Pulp Pap Can* v 88 n 10 Oct 1987 p 94-98, 100-102.

**076439 EFFICIENT WINDER TECHNOLOGY FOR TWO-DRUM WINDERS.** It is best to increase the capacity of a winder by reducing the shutdown times. The possibilities of this are full or extensive automation of set changing, parent roll changing, trim changing, and new web threading. At an assumed PM speed of 3600 fpm and a reserve time of 30 minutes per shift, the required winder speeds would be 6600 fpm, 5900 fpm, 5750 fpm and 4900

fpm. Considerations in machine design selection and prerequisites for high operating speed and optimum web run for two-drum winders are given.

Kaipf, Walter (J.M. Voith GmbH). *PIMA Mag* v 70 n 3 Mar 1988 p 27-30.

**076440 EFFICIENT WINDER TECHNOLOGY FOR TWO-DRUM WINDERS: PART II.** With the Auto Set microprocessor-controlled slitter positioning device, there is no additional downtime. That's because the positioning operation takes place during the set change. An adjusting time of approximately 40 seconds is attained, irrespective of the number of slitters because they are all positioned simultaneously. The positioning accuracy is  $\pm 0.1$  inches. Automatic reel-spool changing makes a major contribution to further reducing the downtime. Other equipment that contribute to increase in capacity are: quick-change holders for top slitters; small-roll ejector; sorting deck for finished rolls; and web threading devices.

Kaipf, Walter (J.M. Voith GmbH). *PIMA Mag* v 70 n 4 Apr 1988 p 27-30.

**076441 WHAT'S NEW IN BALANCING METHODS FOR CHILLED CAST IRON ROLLS.** Nip control at high calendering temperatures is a consideration in improving paper quality. The author explains several roll designs. He briefly presents an example of how the quality parameters of newsprint have been improved with higher chilled iron roll surface temperatures in a typical six-roll calendar stock.

Rothenbacher, Peter (SHW-Ansonia Inc). *PIMA Mag* v 70 n 4 Apr 1988 p 32-34, 36-37.

**076442 PACKING CRITICAL TO SUCTION ROLL PERFORMANCE, MACHINE RUNABILITY.** Excessive packing wear would occur at the center or at the ends of the packing. This condition would eventually cause a loss of vacuum. As a result, the need for a good, stable packing persisted. This article discusses in general terms the characteristics and physical properties of a useful roll packing material that will function adequately in that application. Early in 1984, Beloit Manhattan R&D, in cooperation with Beloit PMD, developed a nonasbestos suction roll packing line trade named BelSeal. The applications of this material are also discussed. Proper selection of materials, combined with continuous, uniform lubrication and good roll maintenance, assures long packing life.

Boga, Wayne (Beloit Manhattan Inc, Clarks Summit, PA, USA). *Pulp Pap* v 62 n 4 Apr 1988 p 141-145.

**076443 SIZE PRESSES OFFER PROBLEMS, PROMISES.** A brief review of the limitations of the conventional size press is given. As machine speeds have increased, size press roll diameters have also been increased to help compensate for greater hydrodynamic forces. An improvement on the apron size press concept was to combine its use with restricted flow of sizing solution to the pond. The simplest and most reliable device for this use is the weir and spreader pan. The problem with pond turbulence motivated development of modified size press designs to eliminate the pond. These developments include the gate roll size press, metering blade size press; modified size presses featuring short dwell applicators running against the size press rolls.

Klass, Charles P. (Klass Associates Inc, King of Prussia, PA, USA). *PIMA Mag* v 70 n 8 Aug 1988 p 24-27.

**076444 ALTERNATIVES TO THE SIZE PRESS.** The BTG BillBlade coater was invented ago as a size press replacement to apply higher coat weights without film-split-related problems such as sheet marking. The TwoStream is similar in principle to the BillBlade coater, but it runs in an upward direction. Another category is the hybrid combination of a gate roll chain and blade applicator - examples of this are: Beloit Bel Ba Pa coater; Black Clawson Blade Size Press; Gate Roll Jet Fountain. The BTG LAS hydrophilic roll coater has a transfer roll which is chromium plated and treated by a proprietary

etching process. The article discusses the key factors which differentiate the effects of various size application on sheet properties.

Klass, Charles P. (Klass Associates Ltd, King of Prussia, PA, USA). *PIMA Mag* v 70 n 9 Sep 1988 p 19-22.

**076445 IMPROVING APPEARANCES: HOW TO DEAL WITH WRINKLES.** When wrinkles occur, one must determine where the problem occurs - in a certain width of the wrapper, or from a particular backstand. Otherwise, the problem may be with the equipment - which part needs repairs or adjustments. A process of elimination usually works best here. If the equipment checks out, the rubber covering the nip roller must be examined.

Lacroix, Robert (RL&A Inc, Dorion, Que, Can). *PIMA Mag* v 70 n 9 Sep 1988 p 32-33.

**076446 NEWLY DESIGNED TABLE ROLL IMPROVES FORMATION, ALLOWS INCREASE IN SPEED.** Three years ago, a split roll on Gilman Paper Co.'s No. 2 bleached board machine at St. Mary's, Ga., led to a significant new development for improving formation and increasing production speed. The new development, called a Sheraton Roll because of its likeness to a Sheraton column (fluted furniture piece), is a direct result of positive effects the damaged table roll had on wet end performance. Today, several companies use the roll on paper machines making various grades of paper. It is most effective on older machines. The rolls are finding application on machines producing bleached board, lightweight bag, and linerboard, and one is planned for a newsprint machine in Canada. The machine fabric pulls the roll, with its gear-like surface, causing a paddle wheel effect. The roll throws water through the fabric, redispersing the fibers. The roll increased first-pass retention by throwing the fines back up and not letting them come through the wire. It also redistributed the fiber in such a way that the next component could take out more water than it normally would.

Ferguson, Kelly H. (Pulp & Paper, San Francisco, CA, USA). *Pulp Pap* v 62 n 9 Sep 1988 p 214-215.

**076447 ROLL COVER DESIGN CONSIDERATIONS FOR POLYURETHANES.** This article deals with roll cover design considerations for the paper industry. The load-bearing rolls in the press section of a paper machine are typically 20 to 70 inches in diameter. The roll cover thickness varies from 0.5 to 1.25 inches. The surface speed of these machines varies from several hundred to approximately 6,000 feet per minute. The loading may vary from 100 to 2,000 pounds per lineal inch. The elastomers from which the covers are manufactured are viscoelastic. The environment of the press section is one of elevated temperatures in the presence of large quantities of water. The roll cover design is discussed with consideration to these effects. The testing techniques and the methods to determine the hysteresis and dynamic modulus of a material are shown with polyurethane being the example material. (Edited author abstract).

Cheatham, Joseph F. (Stowe Woodward Co). *Rubber World* v 198 n 6 Sep 1988 p 14-19.

## Simulation

**076448 DISCRETE EVENT SIMULATION OF A BROKE SYSTEM.** The use of a discrete event simulation for the analysis of machine breaks on a broke system is demonstrated. The simulation allows us to tie the random nature of machine breaks to the continuous operation of the broke system and its associated control logic. This type of simulation allows the user to understand the effect of break occurrence and the resultant accumulation of broke for use later. The use of this type of simulation in system design, control optimization, and troubleshooting is discussed. (Edited author abstract) 2 refs.

Rounsley, Robert R. (Mead Central Research, Chillicothe, OH, USA). *Process Technol: A Compil of Rec Eng Conf Pap on Process Control and Simul* Publ by TAPPI Press, Atlanta, GA, USA, 1985 p 137-144.

## Testing

**076449 COMPARISON OF METHODS FOR MEASURING WEB TENSION.** The authors tested four web tension meters, covering the principles of using force transducers, sound waves, and pressure. With force transducers, load cells on roll bearings measure the force created by the moving web. The acoustic devices measure the time it takes a sound wave to pass through the web. With pressure, which the web tries to withstand, the web's force of resistance is a function of web tension. While there is no universally suitable technique for measuring web tension, all of the available instruments can be used to solve specific runnability problems. An ideal tension meter has yet to be developed. (Edited author abstract). 6 Refs.

## Transportation

**076450 HOW TO RELOCATE A PAPER MACHINE.** Papermaking in Lenzing dates back to the turn of the 19th century. About 10 years ago, the losses of the paper mill began to rise. Several aspects favored continuing paper production at Lenzing. In mid-1982, the company heard of the availability of a 4.8-m wide MG machine from the Hens Papier mill in the Netherlands, which had been shut down. The offer by Escher Wyss included the complete papermaking machinery from the pulper to the winder, with the electrical and process control equipment. A new marketing and feasibility study by Jaakko Poyry favored the project. How the mill moved its papermaking machinery from Holland to Austria, particularly the voyage of the MG cylinder, is described. The original lay-out of Hens Papier was slightly modified. On May 5, 1984, the new plant was ready for start-up, exactly on schedule, one year and one day after the project was begun.

tho Seeth, Heinz. *PPI Pulp Pap Int* v 29 n 12 Dec 1987 p 50-51.

## Ventilation

**076451 ROLE COILS PLAY IN MILL AIR SYSTEMS.** Coils do not always provide the trouble-free service expected of them. The costs of poor coil performance is significant. Proper coil selection and application can reduce these costs. Three factors to consider in eliminating coil problems are discussed: coil design; coil construction and coil installation. Coil corrosion is also given important consideration.

## Vibrations See Also PAPER AND PULP INDUSTRY—Maintenance; PAPERMAKING.

**076452 VIBRATION ANALYSIS IN THE PRESS SECTION.** This article explains how vibration analysis is used to identify the source of vibrations in the press section. In particular, we examine the issues involved in determining whether the vibrations are emanating from a roll assembly or from the felt. We present three case histories where vibration analysis was instrumental in determining the source of vibrations in the press section. But before going on to the case histories, we provide some background information about the physics of vibration, the measurable parameters, and the equipment used to measure vibration. 9 refs.

Vinicki, John (Lockport Felt, Starkville, MS, USA). *Tappi J* v 70 n 11 Nov 1987 p 91-95.

**076453 HOW TO CONDUCT PREDICTIVE MACHINERY VIBRATION PROGRAMS.** There are a number of basic steps involved in putting together a computerized predictive machinery vibration program

(CPMVP). One must determine critical machinery to be included in the CPMVP with a number of guidelines in mind. There is critical production equipment to be considered. This includes the fourdrinier section, press section rolls, dryer rolls, felt rolls, drives, etc. Also, there is critical production support equipment, including air compressors, product pumps, turbine generators, boiler feed pumps and fans and pulp mill equipment. Miscellaneous gear include plant and office air-handling units and computer room air-handling units. Finally, one should consider any piece of equipment that will shut down and/or affect production schedules if a bearing fails.

Miller, James Sr. (Preventive Maintenance Co); Miller, James Jr. *PIMA Mag* v 70 n 7 Jul 1988 p 34-36.

**Wear** See PULP MANUFACTURE—Refining.

**Wet End** See Also PAPER—Newsprint; PAPER AND PULP MILLS—Corrosion; PAPERMAKING.

**076454 CLOSING THE TECHNOLOGY GAP AT THE WET END.** Many mills, including the big ones, have a large gap in their control systems - a gap at the wet end. This paper describes the problems that this gap caused on a rebuilt, 120,000 tpy machine at the New Thames mill - dramatic, short term variations in retention and sheet breaks. To plug the gap Bowaters invested in pioneering wet end technology, which has given the mill a window into the wet end, and the ability to minimize variations. (Edited author abstract)

Street, Graham (New Thames Mill, Sittingbourne, Engl). *Pap Technol Ind* v 28 n 8 Nov 1987 p 678-680.

**076455 MEASUREMENT OF ALUMINUM HYDROLYSIS IN THE WET END.** Measuring and controlling the extent of aluminum hydrolysis taking place on the paper machine should be beneficial in optimizing wet-end performance. By applying some simple colloid analysis to aluminum hydrolysis, an alum control scheme evolves that shows promise when used on the paper machine in the mill environment. The extent of aluminum hydrolysis is a uniquely important index of alum performance in the wet end, whether for optimizing rosin sizing or wet-end retention. The OH:Al ratio in headbox furnishes reliably depicts the extent of aluminum hydrolysis, and the measurement of the OH:Al ratio is easily performed by process laboratory technicians in a paper mill. Theoretical consideration and laboratory and paper machine results place the optimum OH:Al ratio in the range of 1 to 2. 24 refs.

Cordier, David R. (Delta Chemicals Inc, Searsport, ME, USA); Bixler, Harris J. *Tappi J* v 70 n 11 Nov 1987 p 99-102.

**076456 TAKING A REAL-TIME LOOK AT THE WET END.** Real-time predictability from the wet end has become an industry priority. Chemtronics 4000, a wet-end monitoring and control system, responds to this need by providing on-line retention monitoring and automatic control of retention aid dosage. This capability allows the papermaker to control with a high degree of accuracy the quality of the finished product while the sheet is being formed. The primary function of a wet-end monitoring system is to provide information necessary to establish and maintain wet end stability. A second purpose is to provide real-time information during machine trials and other tests. By guaranteeing immediate feedback, trials can be shortened and provide more useful information with minimal risk of losing control along the way.

Stein, Wilfred (Procomp, Marietta, GA, USA); Marascia, Frank. *PIMA Mag* v 70 n 7 Jul 1988 p 19-21.

**076457 1987 WET END OPERATIONS SEMINAR.** This conference proceedings contains 50 papers which consider the theory and operating practice of the wet end of the paper machine. Design and operation of equipment are described. Wet end instrumentation and troubleshooting are discussed from a theoretical, as well as a practical standpoint. Information is presented on the latest type of equipment. Hydraulics is given ample coverage, as well as

water management aspects of the papermaking machinery operation. Synthetic wire applications, fourdrinier drive requirements and wet end control are also discussed. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11250 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

Anon (TAPPI, Atlanta, GA, USA). *TAPPI Notes* 1987 Wet End Oper Semin, Atlanta, GA, USA, May 4-8 1987. Publ by TAPPI Press, Atlanta, GA, USA, 1987 461p.

## PARACHUTES

### Mathematical Models

**076458 MODELS OF SHAPE DEVELOPMENT IN PARACHUTES ON THE BASIS OF THE THEORY OF LOCAL RADII OF CURVATURE.** This paper is concerned with mathematical models of shape development in parachutes, based on the theory of local radii of curvature. The pertinent equations are derived and the results are compared with experimental data. The agreement is seen to be good. (Author abstract). 8 Refs.

Rysev, O.V. (Univ of Moscow, USSR). *Fluid Mech Sov Res* v 17 n 2 Mar-Apr 1988 p 72-87.

## PARAFFIN WAXES

### Chromatographic Analysis

**076459 DISTRIBUTION OF n-PARAFFINS IN IRAQI PETROLEUM WAXES AND IN A DEVELOPED HIGH MELTING WAX BY GAS CHROMATOGRAPHY.** Iraqi paraffin and microcrystalline waxes and a developed high melting wax were analyzed quantitatively and studied for their distribution of n-paraffins. The method employed an on-column injection technique and capillary gas chromatographic analysis using SCOT SP-2100 fused silica capillary column and certain experimental conditions to ensure quantitative results without discrimination. Hot split injector was also used and results were compared. Physical properties of waxes were studied and discussed as a function of n-paraffin distribution and non n-paraffins content. (Author abstract) 26 refs.

### Dielectric Properties

**076460 DIELECTRIC & ELECTRICAL dc CONDUCTIVITY STUDY OF SOME THERMO-ELECTRETS.** Thermo-electrets of paraffin wax and sealing wax have been prepared by applying various high dc voltages (680, 1320, 2040, 2720, 5400, 4080, 4760 V, etc.) between the electrodes during melting of the waxes. The dc fields were maintained till the completion of solidification of the sample. The dielectric constant ( $\epsilon'$ ) and dc electrical conductivities ( $\sigma$ ) were found out for all the samples. The results are explained satisfactorily on the basis of homocharge and heterocharge. (Author abstract) 13 refs.

### Phase Transitions

**076461 PERIODIC STEADY STATE FOR CYCLIC ENERGY STORAGE IN PARAFFIN WAX.** The thermal performance of a latent heat energy storage unit was studied experimentally at the periodic steady state generated by cyclic energy storage and recovery. The periodic steady state was obtained by alternating identical freezing periods with identical melting periods. The storage unit was a cylindrical container of commercial paraffin wax. Energy was transferred to (and from) the wax by temperature controlled water flowing through a submerged helical coil. Measurements were made of the amount of energy stored and recovered as functions of the

freezing and melting times, the temperature of water and the geometry of the coil. A simple model was proposed to calculate the energy stored or recovered in the periodic steady state. (Author abstract) 13 refs.

### Precipitation

**076462 METHODS FOR PREDICTING WAX PRECIPITATION AND DEPOSITION.** Removal of wax from wells and flowlines can account for significant additional operating costs. To evaluate these potential costs, the operating conditions that allow waxes to precipitate in the wellbore must be identified, and deposition rates must be estimated to determine the costs associated with removal of wax deposits. Presented in this paper are laboratory and analytic methods that can be used to estimate both the critical operating conditions and the deposition rates. The laboratory tests and analysis presented may be used to characterize any type of oil. (Author abstract) 7 refs.

### Testing

**076463 ESTABLISHMENT OF STANDARD SLACK WAX SAMPLES: A REPORT OF THE EUROPEAN WAX FEDERATION TECHNICAL TASK FORCE 12.** Six slack waxes of various types and oil contents were selected, and each tested according to eight ASTM procedures in a round-robin programme. Results from the round-robin tests were processed according to ISO 4259 to establish mean values for the characteristics of the slack wax samples. All test results on the samples are listed, and the range of values (around the established mean) within which a result would be regarded as acceptable is indicated. (Edited author abstract)

**076464 PROTON NMR RELAXATION AND MOLECULAR MOTION OF LONG-CHAIN CYCLIC PARAFFINS IN THE SOLID STATE.** Temperature-dependent measurements have been made on the proton NMR relaxations and proton linewidths of the cyclic paraffins (c-C<sub>24</sub>H<sub>48</sub>, c-C<sub>28</sub>H<sub>56</sub>, and c-C<sub>128</sub>H<sub>256</sub>) in the solid state. It is found that in c-C<sub>24</sub>H<sub>48</sub> and c-C<sub>128</sub>H<sub>256</sub> there exist two transitions, one due to the melting process and the other due to a rapid transition between trans and gauche conformers in a compact structure that consists of two parallel trans zigzag straight chains bridged at both ends in the crystalline state. In c-C<sub>28</sub>H<sub>56</sub> there exists only the transition due to melting. Proton NMR relaxations have also been measured for c-C<sub>40</sub>H<sub>80</sub> and c-C<sub>160</sub>H<sub>320</sub> at room temperature, in addition to those for c-C<sub>24</sub>H<sub>48</sub>, c-C<sub>28</sub>H<sub>56</sub>, and c-C<sub>128</sub>H<sub>256</sub>. It is found that the extent of molecular motion decreases as the chain length increases. (Author abstract) 14 refs.

**Adsorption** See Also ADSORPTION—Mathematical Models.

**076465 SORPTION KINETICS OF HIGHER n-PARAFFINS ON ZEOLITE MOLECULAR SIEVE 5A.** Sorption kinetic measurements on n-paraffins ranging from n-heptane to n-tridecane have been carried out on zeolite molecular sieve 5A. Apparent diffusivity coefficients have been determined from the kinetic data. The effect of carbon chain length, preadsorbed water, and different nonadsorbing solvents on the kinetics of sorption has been examined. (Author abstract) 13 refs.

**076466 GAMMA DISTRIBUTION FUNCTION, BREAKTHROUGH CURVE AND THE ADSORPTION EQUILIBRIA OF NORMAL PARAFFINS.** The adsorption equilibria of normal paraffins in solution with n-pentane on 5A molecular sieves was studied by the dynamic method. The adsorption isotherms of n-decane, n-undecane, and their mixtures were determined at 450K from the breakthrough curves. The isotherms follow Henry's law when the concentration is less than 1.5 mol/l. The gamma distribution function fits the experimental breakthrough curve best. This fact enabled the authors to work out a hypothesis which considers the adsorption in the fixed bed as a typical stochastic process. Thus, the equilibrium loading can be calculated numerically. (Edited author abstract) 6 refs.

**076467 ADSORPTION OF NEOPENTANE BY NONPOROUS CARBONS AND SILICAS.** The adsorption of neopentane (2,2-dimethylpropane) by a range of nonporous carbons and silicas has been studied. It is shown that the shape of the isotherm in the multilayer region depends only on the chemical nature of the adsorbent (i.e., silica or carbon) and is independent of the degree of hydroxylation or the degree of graphitization. This is shown by, inter alia, the constancy of the FHH index ( $2.19 \pm 0.03$  for carbon and  $1.99 \pm 0.03$  for silica). Standard adsorption data for neopentane adsorbed on nonporous carbon and nonporous silica are presented and used to analyze the adsorption isotherms by the  $\alpha_s$  method. (Author abstract) 21 refs.

Carrott, P.J.M. (Brunel Univ, Uxbridge, Engl); Roberts, R.A.; Sing, K.S.W. *Langmuir* v 4 n 3 May-Jun 1988 p 740-743.

**076468 ADSORPTION OF n-ALKANES ON CARBON FIBERS AT ZERO SURFACE COVERAGE.** The Henry's law region of the adsorption isotherms for a series of n-alkanes ( $C_8$ - $C_{13}$ ) on two types of carbon fibers was studied by inverse gas chromatography. The heat, entropy, and free energy of adsorption, calculated from retention data, vary linearly with the number of carbon atoms. The low heats of adsorption for both high-modulus and high-strength fibers indicate a virtual absence of high-energy sites. Increased values of heats of adsorption obtained after the cleaning of the fibers for 100 h in nitrogen at 160°C suggest that the high-energy sites on 'as received' fibers are occupied by physically adsorbed species ( $CO_2$ ,  $H_2O$ ). It is shown that the entropy loss upon adsorption cannot be attributed solely to the loss of one degree of translational freedom and that contributions from rotational and conformational entropy losses must be taken into account. (Edited author abstract) 35 refs.

## Chemistry

**076469 <sup>13</sup>C N.M.R. CHEMICAL SHIFT AND CRYSTAL STRUCTURES OF CYCLIC PARAFFINS OF LONG CHAIN LENGTHS.** High resolution <sup>13</sup>C N.M.R. spectra of cyclic paraffins of long chain lengths up to the carbon number 200 in the crystalline state have been measured by the cross polarization-magic angle spinning technique. It is found that <sup>13</sup>C chemical shift of the main peak for the trans zigzag methylene carbons of cyclic paraffins having the carbon number from 36 to 80 (triclinic form) appears at about 1 p.p.m. further downfield than those having the carbon number from 128 to 200 (orthorhombic form). Such a difference of about 1 p.p.m. is caused by a local change in intermolecular interactions which result in going from the orthorhombic to the triclinic form. (Author abstract)

## Chlorination

**076470 KINETIC ANALYSIS OF ALKANE POLYCHLORINATION WITH MOLECULAR CHLORINE. CHLORINE ATOM/MONOCHLORIDE GEMINATE PAIRS AND THE EFFECT OF REACTIVE 'CAGE WALLS' ON THE COMPETITION BETWEEN MONOCHLORIDE ROTATION AND CHLORINE ATOM ESCAPE.** The free-radical chlorination of alkanes produces polychlorides even at low conversions. These are formed by reaction of chlorine atom/monochloride (or dichloride) geminate pairs. This process has been studied in detail in various solvent systems, and a kinetic scheme has been proposed. Deviations from this scheme have been rationalized as being due to competition between monochloride rotation and reaction of the chlorine atom with reactive molecules in the 'cage walls' surrounding the chlorine atom/chloride geminate pair. Analysis of the dichloride products supports the suggestion that monochloride rotation is not completely 'free' within the lifetime of the geminate pair. (Author abstract) 38 refs.

**076471 CONTRIBUTIONS OF STEREOISOMERISM TO PEAK SHAPES OF BRANCHED PARAFFINS IN THE HIGH-RESOLUTION GAS CHROMATOGRAPHIC ANALYSES OF JET PROPULSION FUELS.** The effects of branched paraffin stereoisomers present in both standards and fuel samples are investigated. Although the standards used in this study are not optically pure, the evidence of the separation of diastereomeric isomers of branched paraffins is shown on a standard nonpolar fused-silica capillary column. Anomalous peak shapes and split peaks are related to stereoisomerism. The typical region of unresolved compounds in the middle of a chromatogram of a kerosene-based fuel is related to the presence of branched paraffin stereoisomers. (Author abstract) 9 refs.

**076473 FAST SEPARATION OF PARAFFINS, NAPHTHENES, AND AROMATICS IN NAPHTHA AND KEROSENE FRACTIONS BY GAS LIQUID-SOLID CHROMATOGRAPHY.** A gas liquid-solid chromatographic column (GLSC) consisting of molecular sieve 5 angstrom coated with 10 percent (w/w) OV-275 silicone oil is utilized to analyze petroleum distillates, naphtha, and kerosene. This work is based on hydrocarbon group type analysis by carbon number distribution for paraffins and naphthenes; individual separation of aromatics is attained because interference from nonhydrocarbons is eliminated. Despite the short column employed in this technique, high efficiency is obtained as all complex components are eluted in 6 min for naphtha and 10 min for kerosene. (Author abstract) 15 refs.

## Crystal Lattices

**076474 ONSET OF CHAIN FOLDING IN ULTRALONG n-ALKANES: AN ELECTRON MICROSCOPIC STUDY OF SOLUTION-GROWN CRYSTALS.** Crystallization of extremely pure n- $C_{398}H_{798}$  from dilute solution is investigated by electron microscopy and differential scanning calorimetry. This long-chain alkane is capable of crystallizing in the extended form or of folding once or twice and thus provides useful insights into the fundamental process of chain-folded crystal growth. Crystallization conditions that give rise to the different crystal types are identified by measuring the variation in dissolution temperature with crystallization temperature and crystallization time. Examples of each type of crystal are examined in the electron microscope using various techniques. Electron diffraction studies show that the chains are substantially perpendicular within the crystals in all cases. In addition, differences in surface regularity between the different crystal types revealed by decoration techniques are discussed. (Edited author abstract) 27 refs.

**Crystallization** See Also POLYMERS—Molecular Structure.

**076476 MOLECULAR ORIENTATION MECHANISM OF n-PARAFFINS AND FATTY ACID THIN FILMS BY EVAPORATION METHOD.** The structure of the evaporated thin films of n-paraffins and long chain fatty acids was studied by X-ray symmetrical reflection technique. The activation energy of evaporation of n-paraffins linearly increased with an increase in the carbon number. Sublimation of paraffins was observed at carbon numbers below 28. Paraffin and stearic acid molecules tended to orient perpendicular to a glass

substrate (normal orientation). The normal orientation could be controlled by supercooling defined by the difference between the melting temperature of the sample and the substrate temperature. Mechanism of the orientation is closely related to molecular motion on the substrate. (Edited author abstract) In Japanese. 14 refs.

## Diffusion

**076477 DIFFUSION OF C<sub>1</sub> TO C<sub>5</sub> NORMAL PARAFFINS IN SILICALITE.** Diffusion coefficients were measured for the C<sub>1</sub> to C<sub>5</sub> normal paraffins in silicalite using a molecular sieve membrane. The coefficients were measured at 334 K and were found to range from  $1.07 \times 10^{-6}$  cm<sup>2</sup>/s for methane to  $2.42 \times 10^{-8}$  cm<sup>2</sup>/s for n-pentane. For each of the gases tested, the diffusion coefficients were found to be independent of diffusant concentration over the concentration range tested. Values of the diffusion coefficients were found to correlate directly with the carbon number of the diffusant. (Author abstract) 9 refs.

Hayhurst, David T. (Cleveland State Univ, Cleveland, OH, USA); Paravar, Ali R. *Zeolites* v 8 n 1 Jan 1988 p 27-29.

**076478 DIFFUSION OF A CHLOROPARAFFIN IN POLYETHYLENE.** The diffusion of a chloroparaffin from PE into benzene, chloroform, carbon tetrachloride and dioctyl phthalate has been studied at different temperatures and on sorption of benzene and dioctyl phthalate by the polymer. The diffusion coefficient of a chloroparaffin depends on the nature of the solvent and is identical for different chloroparaffin concentrations in the polymer. The depth of desorption of the chloroparaffin from PE into dioctyl phthalate depends on temperature. (Author abstract). 3 refs.

**076479 DIFFUSION OF ALKANES IN MOLECULAR SIEVES EVIDENCE FOR CONFINEMENT EFFECTS.** Sorption kinetics, heats of sorption, NMR relaxation time measurements, and molecular graphics simulations support the proposal that confinement effects regulate the diffusional behavior of alkanes in zeolites (ZSM-5, ferrierite, mordenite, type Y) and other molecular sieves (e.g. ALPO-11). The results advocate the existence of a segmental diffusion mode. They also assess the floating and creeping molecule concepts for entities diffusing in pores of atomic size. (Author abstract). 14 refs.

## Forming

**076480 THERMODYNAMIC FUNCTIONS OF FORMATION OF n-ALKANE COMPLEXES WITH CRYSTALLINE UREA.** It is important to know the equilibrium constants of formation of complexes of urea with n-alkanes differing in the number of carbon atoms in their molecules, as functions of temperature. In this investigation we obtained experimental data necessary for calculating the thermodynamic functions of formation of n-alkane complexes with crystalline urea up to the decomposition temperature. It is found that the equilibrium constants decrease with rise of temperature and with decrease of the length of the alkane molecule. Therefore

for formation of urea complexes with a mixture of n-alkanes it is necessary to choose the optimal process temperature, which depends on the average molecular weight of the n-alkanes in the feedstock. The equilibrium constants can be used for estimating the process temperature and the ratio of urea to feedstock of known composition required for attaining the required degree of extraction of n-alkanes. 4 refs.

**Hydrocracking** See Also ZEOLITES—Activation.

**076481 HYDROISOMERIZATION AND HYDROCRACKING OF n-ALKANES. 2. n-HEPTANE TRANSFORMATION ON A Pt-DEALUMINATED Y ZEOLITE - COMPARISON WITH A Pt-Y ZEOLITE.** The transformation of n-heptane was studied at 250°C, 1 atm., pH<sub>2</sub>/pnC<sub>7</sub> = 9 on a series of PtHY catalysts containing 0.045 to 0.85 wt% Pt and having a Si/Al atomic ratio of 9. The results were compared to those obtained with a similar series having a Si/Al atomic ratio of 3. It is shown that the ratio between the number of accessible Pt atoms and the number of acid sites on which the heat of adsorption of ammonia is greater than 100 KJ mol<sup>-1</sup> (nPt/nA) is a good parameter for characterizing the balance between the hydrogenating and the acid functions. The results indicate that Y zeolite with a Si/Al ratio of about 10 is an excellent support for hydroisomerization catalysts. (Edited author abstract) 17 refs.

Alvarez, F. (CNRS, Poitiers, Fr); Giannetto, G.; Guisnet, M.; Perot, G. *Appl Catal* v 34 n 1-2 Oct 15 1987 p 353-365.

**076482 CATALYTIC ACTIVITY OF SILICA-SUPPORTED VANADIUM PARAFFIN REACTIONS.** The preparation of a silica-supported vanadium catalyst, active for converting paraffins (such as n-hexane and n-octane) to aromatics, is described. The catalyst activity depends strongly upon the oxidation state of vanadium. For example, oxidized vanadium has a substantially higher activity and aromatic selectivity than the pre-reduced form. The reaction of n-hexane over both the oxidized and pre-reduced catalyst can be described using first-order kinetics in which catalyst deactivation is also modeled using a first-order rate constant. The activation energies of both the overall and the dehydrocyclization reactions are determined. Catalytic activity is decreased by steam addition to the feed, catalyst pre-sulfiding, and the addition of either antimony or tin to the vanadium. (Author abstract) 16 refs.

**076483 HYDROCRACKING: SCIENCE AND TECHNOLOGY, PROCEEDINGS OF THE NFWO-FNRS CATALYSIS CONTACT GROUP MEETING.** This issue contains 5 papers from the symposium. Conventional high pressure hydrocracking and catalytic cracking are compared with low pressure hydrocracking. The role that new catalysts and in particular zeolites can play in the development of more efficient hydroprocessing technologies is discussed. Recent progress in the understanding of hydrocracking on bifunctional zeolites is presented. The scope of the reported work goes well beyond the field of hydrocracking. Product distributions obtained with model components allow the elucidation of the texture of new zeolites. The development of rate equations taking into account every single elementary step of the reaction mechanism will certainly be applied to other processes in the future. All papers are abstracted and indexed individually. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 10720 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

**076484 HYDROISOMERIZATION AND HYDROCRACKING OF n-HEPTANE ON PtH ZEOLITES. EFFECT OF THE POROSITY AND OF THE DISTRIBUTION OF METALLIC AND ACID SITES.** In the activity, stability and selectivity for n-alkane hydroisomerization and hydrocracking of bifunctional zeolitic catalysts, the ratio of the number of metallic to the number of acid sites is a determining parameter. With PtHY catalysts, the selectivity definitely depends on the number of acid sites which may be encountered by the intermediate olefins between two metallic centres. However, if we were to apply this observation to various PtHY catalysts (in particular with different Si/Al ratios) the active acid sites would have to be identified and their number measured with accuracy. The results obtained with PtHZSM5 catalysts show that the pore structure also plays a significant role through the mode of circulation it imposes on the reactant molecules and through the steric constraints it exerts on the migration and/or on the formation and reactivity of the intermediates. As evidenced with PtHMOR catalysts pore blockage either by platinum crystallites or by carbonaceous compounds can modify the distribution of the products. Moreover their acid sites being stronger, the life time of the adsorbed carbenium ions may be longer and the n-paraffin transformation less selective. 31 refs.

Guisnet, M. (CNRS, Poitiers, Fr); Alvarez, F.; Giannetto, G.; Perot, G. *Catal Today* v 1 n 4 Aug 1987, Hydrocracking: Sci and Technol, Proc of the NFWO-FNRS Catal Contact Group Meet, Ghent, Belg, Dec 3 1986 p 415-433.

**076485 ATTEMPTS TO RATIONALIZE THE DISTRIBUTION OF HYDROCRACKED PRODUCTS. III. MECHANISTIC ASPECTS OF ISOMERIZATION AND HYDROCRACKING OF BRANCHED ALKANES ON IDEAL BIFUNCTIONAL LARGE-PORE ZEOLITE CATALYSTS.** Detailed compositions of the isomerisation and hydrocracking products obtained in the reaction of 2-, 3-, 4- and 5-methylnonane, 2,6- and 3,5-dimethyloctane and 2,4,6- and 3,3,5-trimethylheptane over Pt/USY using a continuous flow reactor and on-line high-resolution gas chromatography are reported. These product distributions can be rationalised and understood by the reaction schemes established for the conversion of long chain normal alkanes over ideal bifunctional large-pore zeolite catalysts. The composition of the hydrocracked products from the mono-, and di-branched feed molecules mentioned is very similar and identical to those from n-decane, previously reported. This indicates that the feedstock molecules are equilibrated in all cases, before substantial cracking occurs. With the tribranched molecules mentioned, the situation is totally different, as the formation of ALPHA-ALPHA-GAMMA-branched isomers, which are cracked very rapidly, requires in the worst case only a few methyl-shifts. (Author abstract) 10 refs.

**076486 KINETICS OF THE HYDROISOMERIZATION AND HYDROCRACKING OF PARAFFINS ON A PLATINUM CONTAINING BIFUNCTIONAL Y-ZEOLITE.** The kinetics of hydroisomerization and hydrocracking of n-octane, n-decane and n-dodecane were studied on a Pt/US-Y zeolite at 130-250°C, 5-100 bar total pressure and molar hydrogen to hydrocarbon ratios from 10 to 150. In first instance modeling was based on the lumping of the components and the reaction network. The obtained Hougen-Watson rate equations are independent of the carbon number of the feed and correspond to a mechanism with a rate-determining step on the acid

function and with a Langmuir sorption isotherm. Next, kinetic equations based upon elementary reaction steps were derived. The corresponding network was generated by an algorithm. The merits of such a fundamental approach are discussed. Estimates of the kinetic parameters obtained by non linear regression are presented. (Author abstract) 12 refs.

## Hydrogenation

**076487 RELATIONSHIP BETWEEN SELECTIVITY IN THE CATALYTIC HYDROGENATION OF ALKANES AND THE ENERGIES OF INTRAMOLECULAR BONDS.** The results of quantum mechanical calculations of C-C and C-H bond energies and experimental data concerning the hydrogenation of hexane isomers on Pt/Al<sub>2</sub>O<sub>3</sub>, Pt/SiO<sub>2</sub>, and Pt/C catalysts have been compared. Depending on the nature of the catalyst, the alkane degradation reactions can take place via one of two mechanisms, which are selective either with respect to the C-C or to the C-H bond energies. A method has been proposed for the experimental determination of the catalyst reaction pathway by the first or second mechanism. (Author abstract) 13 refs.

Gyul'maliev, A.M. (Inst of Combustible Resources, Moscow, USSR); Gagarin, S.G.; Krichko, A.A. *Kinet Catal* v 28 n 5 pt 1 Sep-Oct 1987 p 935-939.

## Isomerization See Also BUTANE—Pyrolysis.

**076488 ISOMERIZATION OF PARAFFIN HYDROCARBONS AT LOW TEMPERATURE.** The isomerization reaction of n-pentane and n-hexane was studied at low temperature (100-150 °C) and at a total pressure of 20 bar on aluminum-oxide supported platinum catalyst modified by chlorination. It was found that, in contrast to the high temperature process using a IP-62 type catalyst, the amount of isomers can be significantly increased and the results obtained approach BP and UOP data. The process is economic and a considerable increase in capacity can be obtained. The octane number of the product mixture is higher by 5-10 times than that of the traditional process. (Author abstract) 7 refs.

Hancsok, J. (Veszprem Univ of Chemical Engineering, Veszprem, Hung); Gaordos, G.; Perger, J. *Hung J Ind Chem* v 15 n 3 1987 p 309-316.

**076489 HYDROISOMERIZATION OF n-PARAFFINS ON A PLATINUM-RHENIUM/PILLARED CLAY MINERAL CATALYST.** An active hydroisomerization catalyst has been prepared by impregnating an acidic pillared clay mineral with the (de)hydrogenation components platinum and rhenium. This material was used to study the hydroisomerization reactions of n-pentane, n-hexane, and n-heptane in hydrogen flowing through a plug flow reactor operated under differential conversion conditions. Single branched isomers were the major reaction products. The rate data agreed well with a Langmuir-Hinshelwood model based on a conventional bifunctional mechanism. The kinetic parameters varied with temperature in a way that is consistent with this model. Selectivity was also tested by changing the ratio of metallic sites to acid sites through selective poisoning. (Edited author abstract) 19 refs.

**076490 SIMPLE MODEL FOR THE REACTION OF NORMAL OCTANE ON Pt/Al<sub>2</sub>O<sub>3</sub> CATALYST.** Design parameters were obtained from a simple model developed for the catalytic reaction of normal octane on platinum-alumina catalyst. The relevant equations were solved analytically and graphically. The model did not involve intramolecular and intermolecular mass transfer phenomena because of the particle size (0.1-0.4 mm); it

took into account kinetic phenomena and was applied in predicting conversion-temperature and conversion-reactor length profiles. Conversion-temperature profiles obtained from the model compared favorably with those obtained experimentally. (Author abstract) 11 refs.

**076491 COMPETITIVE REACTION IN INTRAZEOLITIC MEDIA.** The effects of an aromatics cofeed on paraffin hydroisomerization and hydrocracking over Pt/mordenite are studied as an example of competitive reaction in intrazeolitic medium. Preferential adsorption by the aromatic (benzene) modifies catalytic site distributions available for the paraffin (n-hexane) reaction and also affects diffusional characteristics in the one-dimensional channel structure of the zeolite. A significant inhibition of the hexane reaction is observed. The hexane isomer distribution in the presence of the aromatic is rationalized using concepts of coreactant induced size and shape selectivity modifications. (Author abstract) 30 refs.

**076492 ENERGETICS OF ROTATION AND TRANSLATION IN HEXAGONAL AGGREGATES OF EXTENDED CHAINS.** Potential energy calculations have been for hexane aggregates in the hexagonal arrangement as models of paraffin-like solids. As a part of the general energy hypersurface the feasibility of translation and rotation of extended chains in aggregates has been examined for various degrees of packing. The pure translation is favored over the pure rotation at all interchain separations. The energy map of coupled rotation-translation motion has been developed for the intermediate degree of packing. The energy minima on the map correspond to the parallel orientation of chain backbones and are presumed to represent the prevailing short-range structure of the rotator phase in n-alkane crystals. (Edited author abstract) 29 refs.

## Oxidation

**076493 OXIDATION OF ALKANES IN AQUEOUS SOLUTIONS OF MERCURY(II) SALTS WITH UV IRRADIATION.** An oxidation reaction of saturated C<sub>2</sub> to C<sub>7</sub> hydrocarbons and benzene in aqueous solutions of mercury(II) sulfate at 298°K and with irradiation of light at 180-360 nm has been identified. The main product of the oxidation of ethane is CO<sub>2</sub>. The selectivity of the processes and the kinetic isotope effect (cyclo-C<sub>6</sub>H<sub>12</sub>/cyclo-C<sub>6</sub>D<sub>12</sub>=1.46±0.05) have been determined by means of competing reactions. (Edited author abstract) 16 refs.

**076494 OXIDATION OF n-ALKANES IN PRESENCE OF BINARY NICKEL-CONTAINING CATALYSTS.** Replacement of the manganese component by nickel in the industrial manganese-alkali catalytic system for synthesis of SFA (Synthetic Fatty Acids) improves the fractional composition and raises the content of acids in the oxidation products at the standard degree of oxidation. The binary nickel-alkali catalyst is inferior to the industrial catalyst in activity and selectivity. However, with the use of the nickel-manganese catalyst the oxidation rate can be raised considerably while retaining a

higher yield of acids. The nature of the catalyst components not only influences the activity of the system, but may also alter the selectivity of the process substantially in optimal conditions and concentrations. 5 refs.

**076496 FEATURES OF THE OXIDATION OF n-ALKANES IN THE PRESENCE OF METAL-COMPLEX CATALYSTS.** The inhibiting effect of products of oxidation of n-alkanes on the decomposition of tert-butyl hydroperoxide in the presence of manganese cyclopentadienyl- $\pi$ -tricarbonyl has been revealed. The mechanism of the action of acids and alcohols differs from that of ketones and aldehydes. The force of the effect of acids correlates with their protonic force. During oxidation of n-alkanes in the presence of manganese cyclopentadienyl- $\pi$ -tricarbonyl, oxygen-containing products retard the rate of acid formation in the following order: aldehyde > ketone > alcohol. The rate of formation of carbonyl compounds grows in the presence of aldehydes and acids, ketones having an inhibiting effect, but alcohols hardly affect the rate of the reaction. 5 Refs.

## Phase Equilibria See Also MIXTURES—Phase Equilibria.

**076497 GLOBAL PHASE BEHAVIOR OF MIXTURES OF SHORT AND LONG n-ALKANES.** The perturbed-hard-chain model of S. Beret, M.D. Donohue, and J.M. Prausnitz, in the simplified version of C. Kim et al., is compared with recent VLE data on mixtures of ethane and n-alkanes with carbon numbers from 16 to 24. By using and extrapolating the linear relations between the three adjustable model parameters and the carbon number, as given by C. Kim et al., we find that the experimental isothermal bubble curves are well represented up to the critical pressure without the use of any adjustable parameters. Experimental Henry constants for ethane in eicosane are predicted at all temperatures. This global model is more accurate than the Soave-Redlich-Kwong equation. (Edited author abstract) 24 refs.

**076499 PHASE EQUILIBRIA IN BINARY MIXTURES OF ETHANE + DOCOSANE AND MOLAR VOLUMES OF LIQUID DOCOSANE.** Experimental results for various types of phase behaviour which can occur in the binary ethane + docosane system are presented. The experimental data cover various two-phase boundaries and the three-phase equilibria solid docosane + liquid + vapour and liquid + liquid + vapour. In addition, p,V,T measurements of liquid docosane are carried out. The experimental work is performed within a temperature range of 290-370 K and at pressure of up to 16 MPa. (Author abstract). 15 Refs.

Peters, C.J. (Delft Univ of Technology, Delft, Neth); Spiegelaar, J.; Arons, J. De Swaan. *Fluid Phase Equilib* v 41 n 3 Jul 1988 p 245-256.

**076500 PARTIAL MISCIBILITY BEHAVIOR OF THE ETHANE + PROPANE + N-DOTRIACONTANE MIXTURE.** The liquid-liquid-vapor partial miscibility of the mixture ethane + propane + n-dotriacontane is experimentally studied by using a visual cell (stoichiometric) technique. The ternary mixture, which has no constituent binary partial miscibility, has a liquid-liquid-vapor region bounded by upper and lower critical end point loci and a quadruple point locus (solid-liquid-liquid-vapor). The three-phase region extends from about 47 to 95°C at pressures from 41 to 52 bar. The boundaries of the three-phase region are located in pressure-temperature space, and phase compositions and molar volumes of the three fluid phases are reported along isotherms at 50, 60, and 70°C. (Author abstract). 25 Refs.

## Phase Transitions

**076501 POLYMORPHIC TRANSITIONS OF n-PENTACOSANE SAMPLES PURIFIED BY GEL PERMEATION CHROMATOGRAPHY.** Recently, much attention has been paid to the phase transition behavior of n-alkane crystals. It seems that there is some correlation between these solid-solid transitions and the disordering process of chain molecules in the crystals. For clarification of this, the authors continued the phase study for odd n-alkanes ranging from C23 to C43. This paper is concerned with the interesting finding obtained during the study that the homologous impurity has a profound effect on the polymorphic change in n-pentacosane (C25) crystals. 10 refs.

## Physical Properties

**076502 MOLECULAR MODELING OF THE PHYSICAL PROPERTIES OF THE ALKANES.** Eight physical properties (boiling points, molar volumes, molar refractions, heats of vaporization, surface tensions, melting points, critical temperatures, and critical pressures) of 74 normal and branched alkanes were examined by molecular modeling techniques. Structural parameters employed include Wiener indices, connectivity indices, ad hoc descriptors, information indices, and molecular volumes and surface areas. Most of the properties were well modeled by the Wiener indices, connectivity indices, and ad hoc descriptors. An exception was the melting points, which were not well modeled by any of the available indices. Factor analysis (principal component analysis) was used to examine the intrinsic dimensionalities of the data and parameter sets. (Edited author abstract) 71 refs.

**076503 CONVERSION OF LIGHT ALKANES INTO AROMATIC HYDROCARBONS: 1-DEHYDROCYCLODIMERIZATION OF PROPANE ON PtHZSM-5 CATALYSTS.** Conversion of propane into aromatic compounds (dehydrocyclodimerization) was studied at 530°C on a series of PtHZSM-5 catalysts with different platinum contents. For this reaction, occurring via propene, the product distribution and its change with the conversion rate were compared with those in the conversion of propene on HZSM-5. Large differences were observed; in particular, the selectivity for C<sub>6</sub>-C<sub>8</sub> aromatic products was greater on PtHZSM-5 than on HZSM-5 whereas the selectivity for C<sub>4</sub> and non-aromatic C<sub>5</sub> was lower. These differences can be explained by the significant increase in the aromatization rate of aliphatic C<sub>6</sub> intermediate, dehydrogenation on the platinum sites being faster than hydrogen transfer on the acid sites. (Edited author abstract) 20 refs.

Gnep, N.S. (CNRS, Poitiers, Fr); Doyemet, J.Y.; Seco, A.M.; Ribeiro, F. Ramao; Guisnet, M. *Appl Catal* v 35 n 1 Nov 16 1987 p 93-108.

**076504 FACTORS AFFECTING THE SELECTIVITY OF THE AROMATIZATION OF LIGHT ALKANES ON MODIFIED ZSM-5 CATALYSTS.** The conversion of light (C<sub>2</sub> to C<sub>4</sub>) alkanes to aromatics, chiefly benzene, toluene and xylenes (BTX), can be accomplished using zeolites of the ZSM-5 type. The conversion to aromatics is not completely selective. Light alkenes, the probable reaction intermediates, together with light alkanes, are formed in addition to the BTX components. On H-ZSM-5, all the hydrogen atoms lost on aromatization of the reactant alkane seem to appear in the products as light alkenes. It has been found that, when propane is used as the reactant at 500°C and 0.1 MPa, the BTX selectivity can be increased from ca. 10 percent (H-ZSM-5) to ca. 40 to 45 percent after treatment of the base zeolite with solutions of zinc or gallium nitrate, such that the final zinc or gallium content is ca. 1.0 mass-percent. (Edited author abstract). 15 Refs.

**076505 EXPERIENCE IN OPERATING COMMERCIAL UNITS FOR n-PARAFFIN PRODUCTION.** Analysis of the influence of operation of the principal equipment on the process indices in the recovery of liquid paraffins is of considerable practical interest. The operating efficiency of the units is evaluated on the basis of the coefficient of zeolite utilization. Statistical analysis of equipment operation in commercial units over an extended period showed that unplanned shutdowns were related to burnout of tubes in furnace convection chambers, failure of gears and the guide vanes of compressor impellers, leakage in the tube bundles of coolers and heat exchangers, and leakage in the fittings of valves used to switch the adsorbers. Approximately 60% of the shutdowns were caused by unsatisfactory operation of the compressors. 5 refs.

## Pyrolysis

**076506 MECHANISM OF PYROLYSIS OF n-ALKANES.** The mechanism of pyrolysis of the higher n-alkanes includes the reaction of isomerization of primary n-alkyl radicals to secondary alkyl radicals through a cyclic transition complex (CTC). The most probable path is isomerization through a six-membered CTC; however, isomerization through five- and seven-membered CTCs is also possible. The present work has been aimed at determining the distribution of primary and secondary

n-pentyl radicals formed in the stage of chain propagation and to test the possibility of isomerizing a primary n-pentyl radical R' to a secondary n-pentyl radical R'' through a five-membered CTC. In the pulse-feed experiments, the n-pentane conversion varied from 4 to 27% by weight. The product yields varied linearly with the conversion. 8 refs.

**076507 MECHANISM OF PYROLYSIS OF n-ALKANES. 3. n-HEXANE.** In spite of the large number of publications devoted to n-alkane pyrolysis, only in certain studies can there be found any reliable data on the composition of the pyrolysis products at low levels of conversion. In order to obtain comparable data, the authors investigated n-hexane pyrolysis. The purity of the original n-hexane was 99.97% by weight. The n-hexane-/argon ratio was approximately 1 ml/liter. The reactor temperature was held at 660°C. The products from n-hexane pyrolysis were analyzed. The main products from the pyrolysis were hydrogen, methane, ethane, ethylene, propylene, 1-butene, and 1-pentene. 9 refs.

Rumyantsev, A.N. (Acad of Sciences of the USSR, USSR); Oganosova, E.Yu. *Chem Technol Fuels Oils* v 23 n 3-4 Mar-Apr 1987 p 141-144.

**076508 THERMAL DECOMPOSITION OF 3-METHYLPENTANE AND n-HEXANE: REACTION MECHANISM AND CORRELATIONS BETWEEN STRUCTURE AND FORMATION OF LIGHT OLEFINS.** The pyrolysis of two C<sub>6</sub> alkanes, n-hexane and 3-methylpentane, was investigated in a conventional static apparatus at 420°C and 133 mbar, at low extents of reaction. The primary reaction products were identified and measured by gas chromatography and the corresponding stoichiometric equations were determined. Our experimental results are interpreted by a long-chain radical mechanism of the Rice-Herzfeld type, and clearly show the influence of the structure (linear- or branched-chain) on the yields of ethylene. They provide a useful basis for modelling the reaction at higher temperature. (Author abstract) 15 refs.

Malacarne, P. (CNRS, Nancy, Fr); Billaud, F.; Baronnet, F. *J Anal Appl Pyrolysis* v 12 n 3-4 Nov 1987 p 243-256.

**076509 SELECTIVITY OF INTERACTION OF HYDROGEN ATOMS WITH C-H BONDS AT PRIMARY AND SECONDARY CARBON ATOMS.** A study was made of the influence of H atom concentration on the initial distribution of primary and secondary radicals. Many investigators have noted that alkane pyrolysis is accelerated by the presence of hydrogen. For this investigation the authors selected n-pentane and n-hexane. The n-pentane had a purity of 99.98% by weight, the n-hexane 99.97%. As can be seen from the data the presence of a hydrogen medium in the pyrolysis of n-pentane or n-hexane increased the yield of ethane and reduced the yield of ethylene. This effect is explained by the large contribution from conversion of the ·C<sub>2</sub>H<sub>5</sub> radical to ethane in hydrogen medium in comparison with its decomposition to form ethylene. The total yield of ethane and ethylene is practically identical in the two cases. The data show that in the pyrolysis of n-pentane and n-hexane in a hydrogen medium, the H atom concentrations and the H·:·CH<sub>3</sub> ratios in the reaction zone are considerably higher, but the initial distribution of n-alkyl radicals remains the same as in the experiments with argon atmosphere. Consequently, under the conditions that have been studied, no difference can be observed in the interaction of the indicated radicals with C-H bonds. 11 refs.

**Radiation Effects** See Also ELECTRONS—Physical Properties; HYDROCARBONS—Radiation Effects.

**076510 MECHANISM OF SINGLET ENERGY TRANSFER FROM ALKANES.** By means of pulse radiolysis energy transfer from the first excited singlet of cyclohexane and C<sub>7</sub>- to C<sub>10</sub>-normal alkanes to benzene as solute was studied. For this solute the reaction probability of singlet energy transfer is expected to be one. If this condition is fulfilled, from the reaction radii measured conclusions can be drawn on the mechanism of singlet transfer. Using known diffusion coefficients reaction radii R was determined which are close to the sum of molecular radii. From a comparison with Foerster radii and the Stokes-Einstein relationship it is concluded that the energy transfer from the singlet states of the alkanes investigated to benzene as solute proceeds by collisional interaction. (Author abstract) 10 refs.

## Recovery

**076511 RECOVERY OF OXIDATION QUALITY PARAFFINS FROM GAS OIL: AN EXPERIMENTAL INVESTIGATION.** A two-step process was developed to recover from gas oil purified paraffin wax of suitable carbon chain length for further oxidation to synthetic fatty acids. The process consists of (i) chilling the gas oil to 18°C and separating solidified wax by centrifugal filtration; and (ii) mechanical pressing of the paraffin-enriched fraction to expel the oil and enrich paraffin purity to greater than 90%. The mechanical pressing operation was studied in various pilot scale equipment in order to quantify the effect of operating pressure, cake thickness and retention time, on the quality of wax. The quality was also compared against that of wax obtained by solvent purification. Paraffin wax of the quality suitable as a feed stock for oxidation to fatty acids was obtained. (Author abstract) 5 refs.

Kulkarni, S.M. (Hindustan Lever Research Cent, Bombay, India); Chandrasekaran, K.; Gandhi, A.N. *Indian J Technol* v 25 n 12 Dec 1987 p 607-612.

**076512 PRODUCTION OF HIGH-PURITY PARAFFINS FROM LUBE DISTILLATES.** Laboratory studies have shown that the washing of the adduct in three-stage countercurrent scheme does not always give paraffins with contents of aromatic hydrocarbons no higher than 0.5% by weight. This investigation is aimed at working out conditions for washing the adduct so as to minimize the consumption of washing agent and maximize the purity of the paraffin product. In selecting optimal dewaxing conditions, two goals were set: maximum recovery of paraffins and the production of either a low-pour transformer oil or a component of low-pour oils. It is shown that with countercurrent washing of the adduct in three stages and with a 150% total quantity of solvent, the paraffin contained 0.71% aromatic hydrocarbons. With portion-countercurrent washing in three stages with a 100% total quantity of solvent, the paraffin product contained 0.5% aromatic hydrocarbons; this operation is more economical, and it makes it possible to obtain high-purity paraffins from lube cuts in existing process units without any great amount of reconstruction. The paraffin product obtained can be used in surfactant production. 3 refs.

Abdullaev, E.Sh. (Acad of Sciences of the Azerbaidzhan SSR, USSR); Gadzhiev, A.Sh.; Balayan, R.D.; Novruzov, F.N. *Chem Technol Fuels Oils* v 23 n 7-8 Jul-Aug 1987 p 323-325.

**076513 STABILITY OF ADSORBENT IN RECOVERY OF LIQUID PARAFFINS.** Since engineering calculations of the adsorption process require values of the capacity of the adsorbent for the mixture of n-alkanes contained in the actual feedstocks, the author compared data on the capacity of the MgA adsorbent for n-C<sub>7</sub> with the corresponding values for a mixture of n-alkanes recovered from a 200-320°C cut in a laboratory unit at

400°C with an n-alkane partial pressure of 250 MPa. These studies, which were performed with an accuracy that is adequate for practical purposes, offer a means for determining the adsorbent capacity for the mixture of n-alkanes (α<sub>n</sub>), using x-ray structure analysis data or values of the adsorption capacity for n-heptane. In order to determine the service properties of an adsorbent, it is necessary to know both the adsorption characteristics of the fresh adsorbent and its adsorption isotherms taken during a period of extended operation, modeled by pilot-plant tests. We have tested various modifications of the MgA adsorbent in a pilot unit under steady-state conditions in the stages of adsorption, desorption, and regeneration. As can be seen from these results, satisfactory agreement is obtained between experimental and calculated data on the change in adsorbent capacity. Therefore, the equation derived by the author can be used to predict the level of stable activity of an adsorbent, depending on the operating conditions of the process unit. 6 refs.

Votlokhin, Yu.Z. (Groznyi Petroleum Scientific-Research Inst, USSR). *Chem Technol Fuels Oils* v 23 n 7-8 Jul-Aug 1987 p 326-328.

**076514 RECOVERY OF n-PARAFFINS FROM PETROLEUM FRACTIONS.** The riser adsorption of n-paraffins in a moving stream of adsorbent was investigated. Two diesel fuel cuts were used as feedstocks in these studies: a 180-290°C cut from Stavropol crude and a 200-310°C cut from West Siberian crude, with respective n-paraffin contents of 35% and 15.2% by weight. Experimental data indicate that the riser adsorption process gives n-paraffins with a higher purity. An increase in the partial pressure of n-paraffins also has a greater favorable effect in the riser adsorption. The results of these studies demonstrate the advisability of developing commercial adsorption units for recovery of n-paraffins from petroleum cuts using transfer lines (risers) as reactors. 7 refs.

**076518 MOLECULAR SELF-DIFFUSION IN N-ALKANE-BRINE MIXTURES WITH SMALL ETHOXYLATED ALCOHOLS.** Pulsed-field gradient NMR was used to examine translational self-diffusion of the components of solutions of monoethylene glycol n-butyl ether, brine (NaCl 0.2 M), and decane and of diethylene glycol n-hexyl ether, brine (NaCl 0.2 M), and dodecane. Recent studies of these mixtures revealed association behavior and the presence of fluid microstructures similar to those in micellar solutions and microemulsions. However, our results distinguish these mixtures from microemulsions. The time-average diffusion coefficients measured in the mixtures indicate that each component diffuses molecularly, implying either a very short lifetime or a small population of any microstructures present. Viscosities are reported for all of the mixtures. (Author abstract) 27 refs.

## Thermal Conductivity

**076520 THERMAL CONDUCTIVITY OF n-HEXANE, n-HEPTANE, AND n-DECANE BY THE TRANSIENT HOT-WIRE METHOD.** New absolute measurements of the thermal conductivity of liquid n-hexane, n-heptane, and n-decane are reported. The measurements have been carried out in the temperature range 300-370 K at atmospheric pressure in a transient hotwire instrument. The accuracy of the measurements is estimated to be ±0.5%. The density dependence of the thermal conductivity of n-hexane and n-heptane is found to be well described by a universal equation for the hydrocarbons based on a rough hard-sphere model. The measurements of the three hydrocarbons studied are also employed to generate more accurate effective core volumes, which are the only parameters characteristic of the fluid required for the application of the proposed universal scheme. (Author abstract) 22 refs.

**076521 VOLUMES OF MIXING OF DECANE ISOMERS WITH NORMAL HEXADECANE AT 298.15 K. AN INTERPRETATION IN TERMS OF THE VAN-PATTERSON THEORY.** Excess molar volumes of 2-methylnonane +, 3-methylnonane +, 4-methylnonane +, and 2,6-dimethyloctane + normal hexadecane at 298.15 K were obtained from precise density measurements. Values of  $V_E^m$  are negative over the whole mole-fraction range and vary slightly with the decane isomers within a series. A reasonable agreement was found between the experimental excess molar volumes and that predicted from the Van-Patterson theory. (Author abstract) 7 refs.

**076522 CRITICAL CONSTANTS OF NORMAL ALKANES FROM METHANE TO POLYETHYLENE.** If we are to predict the properties of heavy liquids with corresponding-states correlations based on critical constants, we will need to extrapolate available data for lighter liquids to higher carbon numbers. Such extrapolations are possible, at least empirically, because critical constants apparently approach limiting values as the carbon number goes to infinity. These limits are investigated for normal alkanes. Experimental data are given for the critical temperature, pressure, and density. Although it is generally accepted that we know the most about the critical temperature and the least about the critical density, the discussion shows that it is the limiting value of the critical density that we know with the most certainty. 19 refs.

Tsonopoulos, C. (Exxon Research & Engineering Co, Florham Park, NJ, USA). *AIChE J* v 33 n 12 Dec 1987 p 2080-2083.

**076523 EXCESS VOLUMES OF (n-NONANE + n-UNDECANE) BETWEEN 288.15 AND 308.15 K.** Excess molar volumes of (n-nonane + n-undecane) have been determined from density measurements at 288.15, 293.15, 298.15, 303.15, and 308.15 K. Density was obtained with an Anton Paar densimeter. The molar volumes of (n-nonane + n-undecane), (n-octane + n-undecane), and (n-heptane + n-undecane) are given as functions of temperature and the mole fraction of n-undecane. For each of these three binary mixtures, the coefficient of thermal expansion is plotted against the mole fraction of n-undecane at three temperatures. (Author abstract) 7 refs.

**076524 COMPARATIVE STUDY OF THERMODYNAMIC PROPERTIES AND MOLECULAR INTERACTIONS IN MONO- AND POLYCHLOROALKANE + n-ALKANE OR + CYCLOHEXANE MIXTURES.** The data available in the literature on the excess Gibbs energies,  $G^E$ , activity coefficients at infinite dilution,  $\gamma_i^\infty$ , excess enthalpies,  $H^E$ , and excess heat capacities,  $C_p^E$ , for 10 classes of mono- or polychloroalkanes + n-alkanes or + cyclohexane are examined on the basis of the DISQUAC group-contribution model. The non-polar  $CCl_4$ -containing mixtures can be treated in the zeroth approximation of the model. The dispersive interaction parameters for  $CCl_4$  + n-alkanes, or + cyclohexane, are used to describe the dispersive term for polar chloroalkanes + alkanes. The quasicheical parameters for polar chloroalkanes of the series  $CH_3(CH_2)_m-2CCl_uH_{3-u}$  are the same for n-alkane and cyclohexane mixtures, and decrease regularly with increasing u. The model describes consistently the excess functions for the investigated mixtures. Literature data are critically evaluated. The parameters provided may serve to accurately predict missing quantities. Systematic discrepancies between theory and experiment are noted in mixtures containing long-chain molecules, particularly for  $H^E$  and  $\gamma_i^\infty$ . The calculated  $C_p^E$  curves differ considerably from experimental data. Possible sources of disagreement and ways of

refining the model are discussed. (Edited author abstract) 158 refs.

**076525 PREDICTION OF THERMAL PRESSURE COEFFICIENTS AND INTERNAL PRESSURES FOR NORMAL ALKANES.** Based on the modified van der Waals model, a method for prediction of thermal pressure coefficients and internal pressures for normal alkanes with carbon number 1-36 at various temperatures is established in this paper. It shows that the maximum discrepancy between the calculated and the experimental values is about  $\pm 0.8$  percent for thermal pressure coefficients of normal alkanes at 20°C. Differed from the liquids formed by general small molecules, the value  $B/A^2$  of normal alkanes is not a constant. There is an obvious turning point at carbon number 9. When the carbon number is more than 9, the value  $B/A^2$  decreases remarkably with the increase of carbon chain. (Author abstract). 13 Refs. In Chinese.

**076530 STUDY OF HEAVY ION TRACKS IN PHOSPHATE GLASS DETECTORS.** Samples of phosphate glass detectors have been exposed vertically to  $^{28}\text{Si}$  (6.4 MeV/N),  $^{40}\text{Ar}$  (5.5, 3.75 and 2.55 MeV/N),  $^{56}\text{Fe}$  (6.4 MeV/N),  $^{59}\text{Ni}$  (6.5 MeV/N),  $^{84}\text{Kr}$  (0.9 MeV/N) and  $^{132}\text{Xe}$  (0.9 MeV/N) ions from heavy ion accelerators at the Joint Institute of Nuclear Research (JINR), Dubna (Moscow), U.S.S.R. The exposed samples have been etched in 40 vol% HF and also in NaOH solution of varying concentrations (1-6 N) at 40°C for different etching times. Track diameter variations against the dissolved detector thickness have been studied. The total etchable track length for these heavy ions in this detector has been determined experimentally. The energy loss rate and the range of the heavy ions in this detector have also been computed theoretically. Comparing the total etchable track length with the theoretical range, the critical threshold for etchable track formation has been determined. (Author abstract) 9 refs.

**076533 FROM BUBBLE CHAMBERS TO SCINTILLATING FIBRES: HIGH RESOLUTION PARTICLE TRACKING FOR MICROVERTEX DETECTION.** The problem of high resolution high rate detection of multivertex events associated with heavy flavor production and decay is central to the future physics program both in high energy high statistics fixed target studies, and in the collider detectors. Existing detectors such as silicon microstrip systems, CCDs, etc., are capable of high rate and high precision however they give only one point per track for each plane of the detector with the consequent

large 'overhead' associated with the readout. We therefore consider the alternative of a high resolution high rate triggerable track detector giving 'bubble chamber' quality information with a single plane digital readout. (Edited author abstract) 4 refs.

## Electronic Equipment

**076534 FAST HARDWARE TRACK-FINDER FOR THE CDF CENTRAL TRACKING CHAMBER.** We describe the design, construction, and preliminary operation of a hardware track-finder used in the trigger for the Collider Detector at Fermilab (CDF). The track-finder is a 19 stage digital pipeline which uses fast timing information from the central tracking chamber (CTC) to find high momentum tracks. It then transmits information about the track to the CDF trigger system or a final decision. The track finder has 8 programmable thresholds between 2.5 and 15 GeV. A search for all high momentum tracks in the central tracking chamber can be completed in an average of 2.5  $\mu$ s per event. The momentum resolution is  $\delta P_T/P_T^2 = 3.5\%$ , with a high efficiency that is independent of track density. (Author abstract) 5 refs.

## Equipment See RADIATION COUNTERS.

## Imaging Techniques

**076535 TRACK RECOGNITION IN DIGITIZED STREAMER CHAMBER PICTURES.** A method for recognizing particle tracks in photographic streamer chamber pictures was developed. The pictures were digitized by a high-resolution CCD camera and processed by a computer. After filtering track recognition was carried out in two steps: a 'local' detection of straight track pieces in small sections of the image, followed by a 'global' recognition of the complete track. All tracks were assumed to originate in a single, known interaction point and to be of circular shape. The procedure is demonstrated by means of streamer chamber data for high-energy nucleus-nucleus collisions obtained in the CERN experiment NA35. (Author abstract) 6 refs.

**Focusing** See Also MAGNETIC LENSES—Design; MAGNETS—Applications; PARTICLE OPTICS.

**076546 FOCUSING OF SYNCHROTRON RADIATION.** Focusing of the synchrotron radiation from a storage ring using a convex lens is geometrically analyzed and tested. The source radiation is supposed to have a bivariate normal distribution in its phase space both vertically and horizontally. Its modification caused by a lens is calculated as a function of distances among the source, the lens and the image plane. It is shown that the horizontal image becomes sharpest when the source is focused on the image plane. The vertical image, however, is not sharpest under this condition. The vertical distribution has more information than the horizontal; we can derive the orbit dependence of the vertical profile and the angle distribution of the radiation changing focusing. (Author abstract) 9 refs.

## Mathematical Models

**076548 RELATIVE STABILITY IN NONUNIFORM TEMPERATURE.** Landauer has suggested that the relative stability of a particle diffusing in a bistable potential is affected by an intervening hot layer. We derive this effect both from thermodynamics and from the diffusion equation. For this purpose the proper form of the diffusion equation in a nonuniform medium is established for the case of a Brownian particle. If the diffusion takes place in a ring, the hot layer creates a steady current. (Author abstract) 8 refs.

van Kampen, N.G. *IBM J Res Dev* v 32 n 1 Jan 1988 p 107-111.

**076549 BOUNDARY-LAYER THEORY FOR THE EXTREMELY UNDERDAMPED BROWNIAN MOTION IN A METASTABLE POTENTIAL.** A theory for the boundary layer near the critical trajectory for the extremely underdamped Brownian motion in a metastable potential is presented. The probability distribution function in phase space near this critical trajectory, the average escape energy, and the correction terms for the zero-friction-limit escape rate are calculated. (Author abstract) 26 refs.

Risken, H.; Vogel, K.; Vollmer, H.D. *IBM J Res Dev* v 32 n 1 Jan 1988 p 112-118.

**076550 PARTICLE SIMULATION OF A HIGH-POWER GYROTRON OSCILLATOR.** A self-consistent and time-dependent particle code has been developed to simulate the beam-wave dynamics in a gyrotron oscillator. The code is first applied to investigate the effect of the self-consistent field profile on the scaling of the cavity-filling rate with beam current. The fixed-field theory predicts that the transient-wave growth rate depends linearly on the beam current. The simulation results agree with the theoretical prediction at low beam currents. As the beam current increases, the modified field profile changes the nature of the gain scaling from linear to nonlinear. At higher beam currents, the excited wave is observed to exhibit the behavior of modulated oscillation, due to unequal couplings to the forward- and backward-going waves by the beam. Associated with such

amplitude modulation is a periodic variation of the self-consistent field profile. At still higher beam currents, the system becomes chaotic, showing the effect of period doubling. Simulation results are presented for the efficiency, the self-consistent field profile, and the scaling of the transient growth rate with the beam current. 10 refs.

## Simulation

**076555 SIMULATION OF INTENSE PARTICLE BEAMS WITH REGULARLY DISTRIBUTED GAUSSIAN SUBBEAMS.** Techniques for the simulation

of intense particle beams are investigated with respect to the required number of simulation particles. It is shown that for nonchaotic systems it is advantageous if the particles initially are not distributed in a statistical manner but rather arranged in a regular pattern in phase space. This reduces the number of required simulation particles drastically. In the case of such an initially regular arrangement of particles the algorithm which assigns the charges of the particles to the computation mesh becomes of prime importance. The performances of different commonly used algorithms are investigated. The Gaussian assignment algorithm proved far superior to other more commonly used techniques, allowing simulations even at the theoretical limit of 1 particle per cell. Examples for very accurate simulations of beam dynamics with very few particles using an initially regular mesh of particles and Gaussian assignment are given. (Author abstract) 9 refs.

**076556 CHARACTERISTICS OF MACROPARTICLE EMISSION FROM A HIGH-CURRENT-DENSITY MULTI-CATHODE-SPOT VACUUM ARC.** Macroparticle mass transport, size distribution, and spatial distribution were studied in a  $6.5\text{-MA/m}^2$ ,  $25\text{-ms}$  Cu multi-cathode-spot (MCS) vacuum arc. The macroparticle erosion rate was determined to be  $105 \mu\text{g/C}$ , and together with ionic emission, accounted for most of the cathodic erosion. The number of macroparticles emitted decreased exponentially with macroparticle diameter, with  $20\text{-}80\text{-}\mu\text{m}$  macroparticles carrying the bulk of the mass transport. Macroparticles are emitted preferentially at an angle of  $20^\circ$  with respect to the cathode surface. In comparison to previous investigations, higher macroparticle erosion rates, a larger proportion of large macroparticles, and a higher emission angle are observed, and the differences are attributed to the large current density used in the present experiment. 14 refs.

## PARTICLE BOARD

**076557 BIOLOGICAL RESISTANCE OF SOUTHERN PINE AND ASPEN FLAKEBOARDS MADE FROM ACETYLATED FLAKES.** Standard soil block tests can be used for southern pine and aspen flakeboards made with phenol-formaldehyde adhesive if the boards are first leached to remove toxic residual chemicals which inhibit fungal attack. Standard fungal cellar and termite tests can be applied directly without leaching. Flakeboards made from flakes acetylated by a new simplified dip acetic anhydride procedure are resistant to attack by brown-, white-, and soft-rot fungi and tunneling bacteria at acetyl weight gains above 15%. Acetylated flakeboards at 18 to 21% acetyl weight gains are not completely resistant to attack by subterranean termites. (Author abstract) 20 refs.

Rowell, Roger M. (USDA, Madison, WI, USA); Esenther, Glenn R.; Nicholas, Darrel D.; Nilsson, Thomas. *J Wood Chem Technol* v 7 n 3 Sep 1987 p 427-440.

**076558 CHEMICAL MODIFICATION: ADDING VALUE THROUGH NEW F=PL COMPOSITE PROCESSING TECHNOLOGY.** Chemical modification can greatly improve the biological resistance and dimensional stability of wood products. Application of this technology to wood composites eliminates problems associated with solid wood, such as drying, chemical penetration, and chemical recovery. Aspen flakeboards

made from flakes to about 17-percent acetyl weight gain show no attack after 1 year in fungal cellar tests with brown-, white-, and soft-rot fungi or tunneling bacteria. These same boards swell in water at a much slower rate and to a lesser extent than untreated control boards. The most promising application of chemical modification at this time appears to be in thick fiberboards used in external application. (Author abstract). 20 Refs.

## Bonding

**076559 EVALUATION OF FLAKEBOARD BONDED WITH XYLITOL-MODIFIED ALKALINE PHENOLIC RESIN.** Douglas-fir flakeboards bonded with a xylitol-modified alkaline phenolic resin were compared with similar flakeboards bonded with a commercial phenolic flakeboard resin. The properties compared were modulus of rupture (MOR), modulus of elasticity (MOE), internal bond (IB) strength, and thickness swell after 2 and 24 hours of water soaking. The MOR and MOE values obtained were not significantly different for the flakeboards made with the different resins. IB of the flakeboards was compared before and after accelerated-aging exposure. The average IB strength for the flakeboard bonded with xylitol-modified phenolic resin exceeded the minimal requirements for type 2MF as specified by ANSI A208.1. Measurements taken after the 24-hour water-soak exposure indicated that material bonded with xylitol-modified phenolic resin increased in thickness substantially less than material bonded with a commercial phenolic resin. (Edited author abstract) 6 refs.

**076560 ISOCYANATE ADHESIVE AS A BINDER FOR RED MAPLE FLAKEBOARD.** The possibility of using an isocyanate adhesive as a binder in red maple flakeboard was investigated. The modulus of elasticity, modulus of rupture, accelerated exposure modulus of rupture, and linear expansion of experimental isocyanate-bonded flakeboards was equal to that of phenol-formaldehyde-bonded controls. Internal bond and thickness swell properties of isocyanate-bonded flakeboards were superior to those of flakeboards bonded with phenol-formaldehyde. It was concluded that use of isocyanate adhesive as a binder in red maple flakeboard is feasible. (Author abstract) 16 refs.

## Drying

**076561 ASSESSMENT OF THE KINETICS OF THE DESICCATOR TEST FOR FORMALDEHYDE RELEASE FROM PARTICLEBOARDS.** The recently derived kinetics for the 2-hour desiccator test was experimentally assessed. The desiccator value was studied as a function of kinetic parameters. Experimental findings were compared with computer-simulated curves for the kinetics. All investigated parameters affected the desiccator values as predicted by the kinetic equations, with the exception of the surface area of water; instead, the circumference of water was found to play a kinetic role in the desiccator test. It was demonstrated that the desiccator value was governed by the circumference and volume of water, the rates of formaldehyde diffusion in the water, and the duration of the test. (Author abstract). 4 Refs.

## Manufacture

**076562 PARTICLE BOARD MANUFACTURER UPS EFFICIENCY WITH PC BASED CONTROL.** An Ontario, Canada based supplier of particle board to the

furniture and prefab housing industries recently built a new factory and automated the manufacturing process with a personal computer (PC) based control system. In starting from the ground up, the company wanted streamlined production methods, increased process efficiency and output, and a lower scrap rate than had been achieved in older plants. To meet these objectives, four factory areas were selected for automation, including: raw material batching and grinding, drying, particle conditioning, gluing, and pressing, sawing and warehouse curing. This article discusses system hardware and software, and application specifics.

Benner, Axel (Action Industrie Computer GmbH, Frankfurt, West Ger); Hall, John. *Chilton's I&CS* v 61 n 4 Apr 1988 p 53-54.

**076563 FUNDAMENTALS OF FLAKEBOARD MANUFACTURE: INTERNAL-MAT CONDITIONS.** Real-time measurements were made of temperature, gas pressure, and compaction pressure in the face and core regions of flakeboard panels during manufacture. Data from the manufacture of 24 yellow-poplar flakeboard panels are presented. The effects of press closing time, initial mat moisture content, and platen temperature on internal-mat conditions are discussed. The trends in mat temperature and gas pressure are explained in terms of fundamental concepts of heat and mass transfer, stress relaxation, and phase equilibria. These phenomena occur simultaneously and are strongly interrelated. Internal temperature and gas pressure data can be used to help explain the formation of density gradients in wood-particle composites. (Author abstract) 18 refs.

**076565 PARTICLE BOARDS FROM UNDEBARKED NATURAL RUBBER WOOD AND LIGNOCCELLULOSE BYPRODUCTS.** Particle boards (0.5 in. thick) were prepared from the combination of undebarked rubber wood, wood shavings, mangrove bark, corn cobs, and sugar cane bagasse, by treatment with adhesives based on vegetable tannins. Results from mechanical and various physical tests showed, on an average, that the bending strengths of boards made of 25% undebarked rubber chips were about 30% higher than those of the commercial grade boards of other lignocellulose materials. Additionally, the specific gravity, weight to strength ratio (specific strength), and water resistance of the wood-based board were found to be better. Although no nail fastness test was carried out, all boards showed evidence of nailability. (Author abstract) 10 refs.

Odozi, T.O. (Univ of Port Harcourt, Port Harcourt, Nigeria). *Ind Eng Chem Res* v 26 n 9 Sep 1987 p 1735-1737.

**076566 PROPERTIES OF PARTICLEBOARD FROM REE-TYPHA MIXTURES.** To investigate the suitability of a mixture of reed-typha for particleboard manufacturing, laboratory particleboards were manufactured at a target density of 0.64 g/cm<sup>3</sup> and 16 mm thickness from five levels namely 75 percent Reed (R) with 25 percent Typha (T), 50 percent R/50 percent T, 25 percent R/75 percent T, 100 percent R and 100 percent T, using 8 percent urea-formaldehyde resin as a binder. ASTM standard methods were conducted for evaluation of the mechanical and physical properties. Results show that all properties were highly influenced by the percentage of reed used. Generally, as reed percentage was increased in the mixture, mechanical properties were increased significantly, while physical properties (thickness swelling and water absorption) were significantly decreased. (Edited author abstract). 8 Refs.

**076567 ADHESIVE BONDING OF ACETYLATED ASPEN FLAKES, PART 2. EFFECTS OF EMULSIFIERS ON PHENOLIC RESIN BONDING.** Acetylation of aspen flakes causes a reduction in the wettability of the flakes to a water-soluble phenolic resin. In this study, addition of emulsifiers to the phenolic resin improved wettability of the acetylated flake surface. In general, water-to-oil emulsifiers were more effective than oil-to-water emulsifiers. Internal bond strength and modulus of rupture were higher in acetylated flakeboards in which a water-to-oil emulsifier was added to the phenolic resin compared to nonacetylated control flakeboards made with phenolic resin alone. Image analysis of the failed surfaces of acetylated flakeboards after an internal bond test showed about 50% board failure in the wood and about 50% in the glue-line, regardless of the emulsifier used in the phenolic resin.

## Testing

**076568 TENSILE AND COMPRESSIVE MOE OF FLAKEBOARDS.** Normally pressed gradient-density flakeboards were tested for tensile and compressive modulus of elasticity (MOE). The panels were nonaligned and single-layer aligned. Multiple regression equations were developed for axial MOE versus board specific gravity and ultrasonic wave speed in the direction of mechanical test. These regression equations, along with specific gravity profiles through the panel thickness, were used to calculate predicted effective bending MOE. The regression model found to be most appropriate involved use of logarithmic transformation of the factor and response variables. Tensile MOE of this type of flakeboard apparently exceeds its compressive MOE. Wave propagation speed in the direction of test appears to be a practical measure of alignment, although it is not independent of panel specific gravity. (Edited author abstract) 13 refs.

**076569 ON THE DETERMINATION OF REACTION PRODUCT PARAMETERS USING MUSCOVITE MICA DETECTORS.** Two independent methods have been described and discussed for the determination of reaction product parameters using Muscovite mica track detectors. The first method is based on the experimentally obtained calibration curves for apparent track etch velocity versus residual range in Muscovite mica. In the second method, an empirical velocity-range relationship is used to convert the parameters of the correlated tracks into particle parameters for heavy charged reaction products. This method has been applied for the analysis of some typical events in the 12.5 MeV/nucleon  $^{84}\text{Kr} + \text{U}$  (natural) reaction. The results indicate that the method based upon the apparent track etch velocity vs residual range calibration curves has some severe limitations. (Edited author abstract) 17 refs.

**076576 PARTICLE IDENTIFICATION WITH THE OPAL JET CHAMBER IN THE REGION OF THE RELATIVISTIC RISE.** An important goal of the OPAL jet chamber is particle identification at high momenta by exploiting the relativistic rise of the energy loss. Extensive tests have been performed with the full scale prototype of the OPAL jet chamber to measure the energy loss in an argon-methane-isobutane mixture as function of momentum and particle species. The measurements were done under various operating conditions in order to optimize the operating point, to investigate sources of systematic errors, to monitor the stability of the energy loss measurement and to develop calibration procedures. The particle separation capability in the region of the relativistic rise has been studied at gas pressures of 3 and 4 bar. The adopted operating point represents a reasonable compromise between the requirements for particle identification and tracking accuracy. (Author abstract) 14 refs.

**076579 EVALUATION OF A DIGITAL OPTICAL IONIZING RADIATION PARTICLE TRACK DETECTOR.** An outline of an ionizing radiation particle track detector is presented which can, in principle, determine the three-dimensional spatial distribution of all the secondary electrons produced by the passage of the ionizing radiation through a low-pressure (0.1-10 kPa) gas. The electrons in the particle track are excited by the presence of a high-frequency ac electric field, and two digital cameras image the optical radiation produced in electronic excitation collisions of the surrounding gas by the electrons. The specific requirements of the detector for neutron dosimetry and microdosimetry are outlined (i.e., operating conditions of the digital cameras, high voltage fields, gas mixtures, etc.) along with an estimate of the resolution and sensitivity achievable with this technique. (Edited author abstract) 16 refs.

**076583** **DIODENE  $4\pi$  DETECTOR AT SATURNE.** Diogene, an electronic  $4\pi$  detector, has been built and installed at the Saturne synchrotron in Saclay. The forward angular range ( $0^\circ$ - $6^\circ$ ) is covered by 48 time-of-flight scintillator telescopes that provide charge identification. The trajectories of fragments emitted at larger angles are recorded in a cylindrical  $0.4\text{-m}^3$  Pictorial Drift Chamber (PDC) surrounding the target. The PDC is inside a 1-T magnetic field; the axis of the PDC cylinder and the magnetic field are parallel to the beam. Good identification has been obtained for both positive and negative  $\pi$  mesons and for hydrogen and helium isotopes. Multiplicities in relativistic nucleus-nucleus reactions up to 40 have been detected, limited mainly by the present electronics. (Author abstract) 15 refs.

**076584** **NEW TWO-DIMENSIONAL POSITION SENSITIVE DETECTOR WITH A GOOD LINEAR RESPONSE.** A new pin-cushion type two-dimensional position sensitive detector (PSD) with a good linear response, in which the adjacent point-electrodes are connected by a straight resistive strip, has been developed. In the PSD, the ratio of sensitive area to the total detector area is almost unity. The experimental results show that, for achieving a good linear response in a two-dimensional pattern, the resistance of the resistive strip should be 1/10 to 1/15 lower than the surface resistance per unit square in the resistive anode. Under such a condition, the maximum deviation from the linear relation, which occurs at each corner, is less than 2%. (Author abstract) 4 refs.

**076585** **SOLID STATE ELECTRON DETECTOR FOR THE EB60 ELECTRON BEAM LITHOGRAPHY SYSTEM.** This paper discusses the development of a new solid state electron detector (SSD), which is a key component for a high-precision, high-throughput EB direct exposure system, the EB60. The SSD is a low-noise, fast-response detector for a weak input electron beam signal having a nanoampere current and energy of approximately ten kilo electron volts. The SSD has a new metallization structure on the active area for eliminating the effect of incident photons coming from an optical wafer height sensor. For the smallest input signal (15 keV electrons) operation, an SSD with a wide active area of 25  $\text{mm}^2$  has a current gain of 2300, a rise time of less than 350 ns and a leakage current of 80 pA; this is negligible to the output signal of a microampere. A long-term stability of a 3% current gain decrease after electron beam bombardment for 1000 hours, and a leakage current of 100 pA after bombardment for 5000 hours have been obtained. A highly accurate, high-speed registration mark detection of 0.02  $\mu\text{m}$  and 50 ms per mark has been achieved through the SSD. (Author abstract) 9 refs.

**076586** **LARGE SOLID ANGLE DETECTOR FOR MEDIUM ENERGY CHARGED PARTICLES.** A charged particle detector with 0.7 sr solid angular acceptance has been built, principally to detect protons in the

energy range 25-150 MeV in experiments with tagged photon beams. The detector consists of a three element  $\Delta E_1$ - $\Delta E_2$ -E plastic scintillator telescope. Position information is obtained from the time difference between signals from the two ends of each scintillator. The design of the detector and tests of its performance are described. An energy resolution of 2.8 MeV fwhm at 60 MeV proton energy, and a two-dimensional position resolution of 24  $\text{mm} \times 41 \text{ mm}$  fwhm has been obtained. Successful operation in the tagged photon environment is demonstrated. (Author abstract) 9 refs.

**076587** **INTERSTRIP SURFACE EFFECTS IN OXIDE PASSIVE ION-IMPLANTED SILICON STRIP DETECTORS.** An investigation is reported into charge sharing effects for highly ionising particles penetrating the interstrip gap for ion-implanted silicon strip detectors. It is found that under certain conditions anomalous polarity pulses are induced on adjacent strips. This effect is analyzed with a model that takes account of the surface charge trapped on the Si-SiO<sub>2</sub> interface between the adjacent strips. (Author abstract) 6 refs.

**076588** **POSITION-SENSITIVE DETECTOR WITH MICROSTRIP ANODE FOR ELECTRON MULTIPLICATION WITH GASES.** A position-sensitive detector of a new type has been developed. A microstrip anode replaces the wires generally used for electron multiplication with gases. The microstrips which are fixed on a glass substrate are produced by means of photolithography. The applied electric potential alternates between each strip. With a position-sensitive neutron detector equipped with this new type of anode a counting rate of 2.3  $\text{MHz}/\text{cm}^2$  has been measured. The microstrip anode combines the improved qualities of a proportional counter with certain properties of a photomultiplier tube. (Author abstract) 5 refs.

**076590** **PARTICLE IDENTIFICATION VIA PULSE-SHAPE DISCRIMINATION WITH A CHARGE-INTEGRATING ADC.** A charge-integrating ADC has been used to sample the intensity in two different time regions of a pulse and thus to sense the shape of the pulse. This idea has been applied to produce neutron/ $\gamma$ -discrimination from pulses in a liquid scintillation detector. Optimization of available parameters yields good pulse-shape discrimination for pulses greater than those produced by 100 keV electrons. The method uses only general purpose electronics. (Author abstract) 15 refs.

**076591** **BEHAVIOUR AND RESPONSE VERACITY OF LARGE AREA TRANSMISSION AVALANCHE COUNTERS AS ELEMENTARY DETECTING DEVICES.** Parallel plate avalanche counters (PPAC) with an active area of 80  $\text{cm}^2$  and an electrode spacing of 1-4 mm are investigated. The behavior and the response veracity of the transmission PPAC, when used as an elementary detecting device, i.e. just to count events, with simple spectrometric and timing (without TOF coincidence) mode electronic systems are assessed at n-heptane pressures of 5-30 Torr using low-energy  $\alpha$ -particles. Beside the PPAC intensity transmittance ( $\leq 1.05$  at the plateau centre), the plateau slope ( $\geq 6 \times 10^{-4}/\text{V}$ ) and width ( $\leq 115 \text{ V}$ ) of the counting rate curve are evaluated. In addition, the counter behavior beyond the low-voltage plateau and is investigated. High spurious pulse counting rates, almost solely due to charge carrier regeneration under strong electric fields, are reported. Empirical relations are determined among the PPAC characteristic voltages to provide for a safe estimation of the detector electrical strength. (Author abstract) 17 refs.

**076592** **THERMAL HISTORY AND LENGTH DISTRIBUTION OF FISSION TRACKS: PART II.** In Part I of this paper a mathematical model was developed to derive the length distribution  $n(l)$  of partially annealed fission tracks within a sample as the result of an earlier time-dependent temperature  $T(t)$ . An empirical annealing law is the basis of this model wherein experimental data in apatite are used as an example. In the present work the length distribution  $\sigma(h)$  of the normal projections  $h$  of stochastically truncated tracks in an intersection plane is considered, and it is shown that the function  $T(t)$  could be pronounced even in the monotonically decreasing length distribution  $\sigma(h)$ . Results of simulating calculations show that - on the basis of a known annealing function - it is in principle possible to compute  $T(t)$  by proceeding from an 'experimentally' given distribution  $\sigma(h)$ . (Author abstract) 4 refs.

**076596 MULTIPIN GAS-DISCHARGE DETECTOR WITH BALL-TIPPED ANODES.** A new gas-discharge particle detector is described. The ball-tipped anodes of the detector are 2 mm in diameter. The detector operates in the self-quenching mode with high efficiency, and its counting rate is characterized by a wide plateau. The maximum counting rate at one ball-tipped anode is approx.  $2.5 \times 10^4 \text{ s}^{-1}$ . Utilization of spherical anodes will make possible the construction of reliable detectors of complex shapes. In such detectors two-coordinate registration of multiparticle events may be readily organized in a natural manner. (Author abstract) 9 refs.

**076597 ANALYSIS OF A MICROWAVE CAVITY DETECTOR COUPLED TO A NOISY AMPLIFIER.** In a class of detectors for light pseudoscalar particles, a microwave cavity traps photons produced by the interaction of the particles with a strong magnetic field. The cavity strongly influences the signal and noise properties of the amplifier coupled to its output. We present the theory of a noisy amplifier coupled to a microwave cavity, along with experimental data for a cryogenic GaAsFET amplifier. The signal-to-noise ratio of the cavity-amplifier system is determined, and applications to the measurement of amplifier parameters are discussed. (Author abstract) 14 refs.

**076598 DESIGN AND TESTS OF THE Z-COORDINATE DRIFT CHAMBER SYSTEM FOR THE OPAL CENTRAL DETECTOR AT LEP.** A system of drift chambers has been designed to make high resolution measurements of the z-coordinates of charged tracks at the outer radius of the OPAL central detector at LEP. The unit module of this detector is a 25 cm drift length bidirectional cell with six sense wires in a thin 50 cm wide by 29 mm high drift slot. Tests indicate that the chamber has a wide and stable electric field operating range and its performance is unaffected by small misalignments between the drift electric field and an external magnetic field. The drift cell was found to have uniform acceptance up to its geometrical boundaries, and the z-resolution for beam tracks normal to the chamber was measured to be in the range of 40-175  $\mu\text{m}$ . (Author abstract) 12 refs.

**076599 STUDY OF NONFLAMMABLE GAS MIXTURES FOR LIMITED STREAMER TUBES IN THE VENUS DETECTOR AT TRISTAN.** Performances of limited streamer tubes operated with nonflammable gas mixtures composed of argon (Ar), carbon-dioxide ( $\text{CO}_2$ ) and isobutane ( $i\text{-C}_4\text{H}_{10}$ ) with ratios of 1:1.5:0.15, 1:2:0.2, 1:3:0.3, 1:4:0.4 and 1:6:0.6 were studied. It was found that these mixtures were very suitable for the VENUS detector. The charge spectra exhibited very sharp distributions and indicated the possibility for the limited streamer tubes to be applied to calorimetry use. A mixture of 1:2:0.2 was

chosen for the VENUS streamer tubes because of its moderate gain and long efficiency plateau. (Author abstract) 6 refs.

**076602 CDF VERTEX TIME PROJECTION CHAMBER SYSTEM.** The vertex time projection chamber (VTPC) system is one of the major components of the charged particle tracking system for the Collider Detector at Fermilab (CDF). The chambers cover about seven units of pseudorapidity ( $\eta$ ) and must be capable of handling substantially more than the 30-35 charged particle tracks produced by typical  $\text{pp}$  collisions at center-of-mass energies of 1.8 TeV. The chambers are optimized to provide the good pattern recognition in the  $r$ - $z$  view required to locate the event vertex, measure the overall event topology, and to complement the  $r$ - $\phi$  tracking in the large axial wire drift chamber that surrounds them. (Edited author abstract) 19 refs.

**076603 BEAM AND DETECTOR FOR A HIGH-PRECISION MEASUREMENT OF CP VIOLATION IN NEUTRAL-KAON DECAYS.** The  $K^0$  beam and detector used for a high-precision measurement of the CP-violation parameter  $\epsilon'$  at the CERN Super Proton Synchrotron (SPS) are described. The beam provides  $K_L$  and  $K_S$  alternately through a common decay region. The detection of the decays is based on wire chambers and calorimeters without employing a magnet. The trigger and readout system achieve a high selectivity for the suppressed, CP-violating, two-pion decays of the  $K_L$  by incorporation of hard-wired processors. The readout is based on Fastbus for maximum data rates. (Author abstract) 15 refs.

**076604 OPERATION OF LIMITED STREAMER TUBES WITH THE GAS MIXTURE  $\text{Ar} + \text{CO}_2 + n\text{-PENTANE}$ .** The active detectors of the ALEPH hadron calorimeter at LEP consist of plastic streamer tubes

developed in Frascati. The standard gas mixture for the operation of such devices is argon-isobutane (30/70). However, in underground experiments, for safety reasons, one has to reduce the hydrocarbon content. Therefore a study of the behaviour of streamer tubes operated with an  $\text{Ar}/\text{CO}_2/n\text{-pentane}$  mixture has been performed. The influence of gas composition on efficiency, charge distribution and stability of operation has been investigated, and the results of these tests are presented. (Author abstract) 5 refs.

**076605 PARAMETERS OF ASSEMBLY OF MICROCHANNEL PLATES WITH MICROMETER GAPS.** The characteristics of a herringbone assembly of microchannel plates with gaps of 5 and 15  $\mu\text{m}$  between them are studied. Gain  $K \leq 3.10^7$  with amplitude resolution  $R \geq 30\%$  is achieved in registration of ultraviolet photons and energetic neutral particles; a critical load of approximately 0.1/channel/sec is determined. The assembly can be effectively used when microchannel plates with curved channels are required. The assemblies were exposed to beams of neutral He and Ar atoms with energies of 1.5 and 3 keV and also to ultraviolet photons with a wavelength of 147 nm. (Edited author abstract) 7 refs.

**076606 INFLUENCE OF GAS MIXTURE AND PRIMARY IONIZATION ON THE PERFORMANCE OF LIMITED STREAMER MODE TUBES.** We report a study of the dependence of limited streamer mode operation on gas composition. Results are given for the plateau onset voltage, plateau length, charge spectra and pulse width for various fractions of (Ar,  $\text{CO}_2$ , pentane) and (Ar, isobutane). In addition, a series of argon-free strong quenching gas mixtures has been studied which have very attractive characteristics. Chamber lifetime tests for these are also reported. As part of a study of the nature of the limited streamer mode mechanism, the response to X-rays and minimum ionizing particles are compared and differences noted. The character of the primary ionization is found to have a clear effect on the chamber response even in the streamer region. (Author abstract) 13 refs.

**076607 COMPUTER-CONTROLLED WIRE TENSION MEASUREMENT SYSTEM USED IN THE FABRICATION OF THE CDF CENTRAL DRIFT TUBE ARRAY.** We have developed a sensitive computer-controlled method for measuring the anode wire tensions of individual drift tubes which have a wire support located mid-length along the tube. By resonating the anode wire at higher harmonics of the fundamental resonance frequency, simultaneous measurement of the anode wire tension and verification of the location of the wire support was achieved. The anode wire tension for each drift tube was measured to better than 0.5% accuracy and the location of the anode wire support measured to better than 0.01% for drift tubes 3 m in length. This method was used for measuring the wire tensions of 2226 drift tubes during the fabrication of the CDF central drift tube array. (Author abstract) 7 refs.

**076619 SURFACE STUDIES OF PLASTIC STREAMER TUBES.** This study gives new insight into the possible sources of dark currents and continuous discharges in plastic streamer tubes. It was shown that a normal PVC cathode surface is covered by a large number of nonconductive areas which appear to be composed of clusters of grains, 3-5  $\mu$ m in size. An X-ray analysis suggested that these grains are of CaCO<sub>3</sub>, a filler material in the PVC. We suspect that these grains constitute a major cause for the dark currents by provoking electron emission to the gas volume through the Malter effect. We also showed that a treatment with an anti-static liquid, BREOX B-35, helps to cure the lack of conductivity in the observed non-conductive regions. 15 Refs.

**076620 TRACK DIAMETER & LENGTH MEASUREMENT OF HEAVY IONS IN CR-39 (DOP) PLASTIC TRACK DETECTOR.** Samples of CR-39 (Dop) plastic track detector were exposed vertically as well as at different angles of incidence with respect to the detector surface, to  $^{16}\text{O}$ ,  $^{20}\text{Ne}$ ,  $^{28}\text{Si}$ ,  $^{56}\text{Ni}$  ions of energies 8.7, 7.7, 6.4, 6.4 and 6.5 MeV/N respectively at the Joint Institute of Nuclear Research, Dubna, Moscow. These exposed samples have been etched in 6.25 N NaOH at 70°C. The variation of track diameter with etching time has been studied and total etchable range for different heavy ions in this detector has been found. The energy loss rate,  $dE/dx$  and range of these heavy ions in this detector have been computed theoretically. A comparison has been made with the experimental results. (Edited author abstract) 12 Refs.

**076621 ELECTRONICALLY CONTROLLED DETECTION OF CHARGED PARTICLES IN NUCLEAR EMULSIONS.** The phenomenon of electric-field stimulated increases in the sensitivity of nuclear emulsion is described. In an emulsion with a low content of AgBr, a double field pulse with alternating sign drives the Ag<sup>+</sup> ions to the grain boundaries and creates an internal polarization field. The effect is used to construct a track detector with electronically controlled sensitivity. (Author abstract) 10 Refs.

**076622 CDF DETECTOR: AN OVERVIEW.** The Collider Detector at Fermilab (CDF) is a 5000 t magnetic detector built to study 2 TeV  $p\bar{p}$  collisions at the

Fermilab Tevatron. Even analysis is based on charged particle tracking, magnetic momentum analysis and fine-grained calorimetry. The combined electromagnetic and hadron calorimetry has approximately uniform granularity in rapidity-azimuthal angle and extends down to  $2^\circ$  from the beam direction. Various tracking chambers cover the calorimeter acceptance and extend charged particle tracking down to 2 mrad from the beam direction. Charged particle momenta are analyzed in a 1.5 T solenoidal magnetic field, generated by a superconducting coil which is 3 m in diameter and 5 m in length. (Edited author abstract). 27 Refs.

(Univ of Tsukuba, Jpn); Amidei, D.; Apollinari, G.; Ascoli, G.; Atac, M.; Auchincloss, P.; Baden, A.R.; Barbaro-Galtieri, A.; Barnes, V.E.; Barsotti, E.; Bedeschi, F.; Belforte, S.; Bellettini, G.; Bellinger, J.; Besniger, J.; Beretvas, A. *Nucl Instrum Methods Phys Res Sect A* v A271 n 3 Sep 1988 p 387-403.

**076623 SILICON COUNTER ARRAY FOR  $^2\text{He}$  DETECTION.** A multicounter array consisting of four Si detector telescopes was developed for the coincidence measurement of two protons with small relative energy ( $^2\text{He}$ ). Silicon detectors were designed and fabricated so that they have large solid angles when they are assembled to form a counter array. A total effective solid angle of 5-7 msr was achieved for the detection of 20-50 MeV  $^2\text{He}$  with relative energy lower than 1 MeV. A compact amplifier system was developed using low-noise hybrid ICs to treat many signals from the counter array. (Author abstract). 13 Refs.

**076624 MODULAR NaI(Tl) DETECTOR FOR INTERMEDIATE ENERGY PHOTONS.** We describe the properties of a detector array made up of 64 NaI(Tl)  $406 \times 63 \times 63 \text{ mm}^3$  modules, used as an intermediate energy photon spectrometer. We obtain an energy resolution of 6% FWHM at 129 MeV, a time resolution of 1 ns FWHM and a resolution of 48 mm FWHM for the location of the impact point on the front face of the detector. The modularity allows to some extent a discrimination between photons and neutrons. We also present the response of the detector to 69 MeV neutrons. (Author abstract). 6 Refs.

**076625 COMPACT AND GRIDLESS CHANNEL PLATE START DETECTOR.** A small gridless time detector consisting of an electron emitting foil and two channel plates with central holes and without any grid or wire, i.e. with 100 percent transmission, is described. For  $\alpha$ -particles a time resolution of 90 ps and an efficiency up to a maximum of about 50 percent have been obtained. The efficiency for heavily ionizing particles like evaporation residues or fission fragments is 100 percent and with an elastically scattered 26 MeV/amu  $^{32}\text{S}$  beam an overall time resolution of 60 ps achieved. (Author abstract). 10 Refs.

**076628 PHONON-MEDIATED PARTICLE DETECTION.** When an incident particle collides with an electron or nucleus in an insulating crystal, the recoil kinetic energy is converted rapidly into a burst of low-energy phonons. If the crystal is very pure and free of defects, and if it is very cold ( $T \approx 0.1 \text{ K}$ ), the phonons will propagate ballistically for distances of several centimeters. The authors report on experiments with two types of superconducting phonon sensors being considered for use on a new kind of particle detector, which is based on this effect. The device, which is called a Silicon Crystal Acoustic Detector (SiCAD), reads out phonons generated by particle scattering events. 7 refs.

**076629 PHONON MEDIATED POSITION RESOLVED DETECTION OF  $\alpha$ -PARTICLES WITH SUPERCONDUCTING TUNNEL JUNCTIONS.** The authors report that 5-MeV  $\alpha$ -particles bombarding the back of a silicon wafer (3-mm thick) through two collimating holes of 0.75-mm distance were simultaneously detected with three Al tunnel junctions (5-mm separation) at the opposite face of the wafer. Signals from the junctions originated from phonons traveling ballistically from the region of absorption to the crystal surface. The highly anisotropic phonon flux that arises from phonon focusing effects and the relative timing of pulses from different junctions allowed a clear separation of events from  $\alpha$ -particles passing through different holes. 9 refs.

Peterreins, T. (Tech Univ Munich, Garching, West Ger); Probst, F.; Feilitzsch, F.v.; Kraus, H. *IEEE Trans Nucl Sci* v 35 n 1 Feb 1988, 34th Nucl Sci Symp, San Francisco, CA, USA, Oct 21-23 1987 p 70-72.

**076630 APPLICATIONS OF SUPERHEATED SUPERCONDUCTING DETECTORS.** When an incident particle collides with 8- $\mu\text{m}$  superheated superconducting granules, if the deposition of energy within the granule is sufficient to overcome an energy threshold, the granule will change state. The Meissner effect characteristic of the superconducting state suddenly vanishes and the magnetic field penetrates into the granule, causing a change of flux in a pickup coil containing this granule. This effect provides a practical detector if large numbers of granules are used. X-ray imaging devices, transition-radiation detectors and indium solar neutrino detectors are briefly presented, together with a discussion of the main features of this type of detector. 12 refs.

**076631 AVERAGE ENERGY NEEDED TO PRODUCE AN ELECTRON-HOLE PAIR IN GASE NUCLEAR PARTICLE DETECTORS.** Gallium selenide (GaSe) detectors, which were fabricated by evaporating small electrodes of various metal films (Au, Al, In, In + Hg, Ag, and Sn) onto 50- to 150- $\mu\text{m}$ -thick plates cleaved from Bridgman-grown crystals, have been tested. One detector exhibited pulse heights that corresponded to 4.5

eV, possibly 4.0 to 4.3 eV, as an average energy necessary to produce an electron-hole pair for 5.5-MeV alpha-particle irradiation. These measured values are smaller than the 6.3 eV predicted by the Klein formula. 4 refs.

**076632 DESIGN AND FABRICATION OF ADVANCED HYBRID CIRCUITS FOR HIGH ENERGY PHYSICS.** Current design and fabrication techniques of hybrid devices as applied to the Stanford Linear Collider Large Detector (SLD) are discussed. Methods of developing layouts ranging from hand-cut templates to advanced designs utilizing CAD tools with special hybrid design software were applied. Physical and electrical design rules for good yield and performance are discussed. Fabrication and assembly of a variety of SLD hybrids using different construction methods are described. 7 refs.

**076633 DATA ACQUISITION FOR THE HILI DETECTOR.** A large acceptance, multisegmented detector system capable of the simultaneous detection of heavy ions and light ions (HILI) has been constructed. The heavy ions are detected with a segmented gas-ionization chamber and a multiwire proportional counter, while the light ions are detected with a 192-element plastic 'phoswich' hodoscope. Processing the large number of signals is accomplished through a combination of CAMAC and FASTBUS modules and preprocessors and a host mini-computer. Details of the data acquisition system and the reasons for adopting a dual-standard system are discussed. A technique for processing signals from an individual hodoscope detector is presented. 4 refs.

**076638 RECENT DEVELOPMENT OF DETECTORS WITH INTEGRATED CAPACITORS AND POLYSILICON RESISTORS.** A silicon microstrip detector has been developed with capacitive coupling of the diode strips to the metallization and with polysilicon bias resistors to each diode. It allows the decoupling of the leakage current from the input to the charge-sensitive amplifier. Results are given on the coupling capacity and the breakdown voltage as well as on the polysilicon line resistance. It is found that the coupling capacitance, varying between 25 pF and 80 pF as a function of the oxide thickness, is large enough to avoid capacitance signal losses to the backplane. The 200-nm-thick silicon oxide withstands a potential difference of 100 V or more, thus allowing the operation of the detector with the metal strips and backplane at a ground potential and the bias voltage applied to the diodes. 3 refs.

**076641 AGING EFFECTS IN LOW PRESSURE WIRE CHAMBERS CONTAINING TMAE.** The effects of aging in multiwire proportional chambers operated at low pressure with gas mixtures containing TMAE has been studied in connection with their use as a form of readout of  $BaF_2$  crystals in high-rate environments. Aging was induced by ultraviolet light, which simulated high radiation exposure of  $BaF_2$  crystals. Measurements were made on the loss in gain as a function of the total charge removed from the anode wires under various operating conditions. The results indicate a considerable improvement over previous aging effects measured at atmospheric pressure. 10 refs.

**076646 DELPHI SILICON STRIP MICROVERTEX DETECTOR.** The silicon strip microvertex detector for the DELPHI experiment at LEP is presented. It consists of two cylindrical layers with a total of 165,888 strips. The design parameters of the final project are described. The microstrip counters have a pitch of 16.6  $\mu$ m, and are read out every 50  $\mu$ m using the capacitive charge division method. The electronics used is the Microplex chip, an NMOS integrated circuit, which provides 128 channels of low noise charge sensitive amplifiers with multiplexed analog output. Results of signal-to-noise ratio from beam tests on prototype detectors are given and discussed. (Author abstract) 11 refs.

**076655 STUDY OF THE IDC AS A HIGH RATE VERTEX DETECTOR FOR THE ZEUS EXPERIMENT.** Measurements with the induction drift chamber (IDC), resulting in a position resolution of  $\sigma = 25 \mu\text{m}$ , are reported. The angular effect is determined, and Monte Carlo calculations show that the error is dominated by ionisation fluctuations. The application of this detector principle towards a high rate vertex detector for an  $e$ - $p$  collider is discussed, and a solution for the high density readout presented. (Author abstract) 11 refs.

**076656 FAST TRACKING DETECTOR USING MULTIDRIFT TUBES.** We describe a tracking detector designed as an assembly of multidrift tube modules because of its fast time-resolution and good position accuracy, coupled with high reliability, the device seems suitable for operation as vertex detector at a collider, and for other high-rate applications. Recent measurements of localization accuracy obtained when operating the modules with a dimethyl ether gas filling are presented. (Author abstract) 10 refs.

**076657 MARK III VERTEX CHAMBER: STUDIES USING DME.** We have performed studies using a prototype of a pressurised wire vertex chamber with 8 mm diameter straw geometry. We obtained 35  $\mu\text{m}$  spatial resolution using dimethyl ether (DME) at 1 bar, and 30  $\mu\text{m}$  using argon/ethane (50/50 mixture) at 4 bar. Preliminary studies show the DME to adversely affect such materials as aluminised Mylar and Delrin. (Author abstract) 1 ref.

**076658 PROSPECTS FOR COLLIDER VERTEX DETECTORS.** The technologies available for vertex detection are discussed. The detection techniques now available do not limit the ultimately attainable resolution. The limitations are set first by multiple Coulomb scattering of outgoing tracks and secondly by how close-in detectors can be placed and still function in the radiation backgrounds. (Author abstract) 4 refs.

**076659 SILICON STRIP VERTEX DETECTOR FOR THE MARK II EXPERIMENT AT THE SLAC LINEAR COLLIDER.** In the near future the Mark II experiment will begin the study of the  $Z^0$  at the SLAC Linear Collider (SLC). In order to study the decays of the  $Z^0$  to short-lived particles, the authors are developing a silicon strip vertex detector (SSVD) for use in the Mark II detector. The physics motivation and preliminary design for the SSVD have been given. In this paper, the present design and status of this device are described.

**076661 STATUS OF SPARK COUNTERS WITH A LOCALIZED DISCHARGE.** A particle identification time-of-flight system based on spark counters has been developed at Novosibirsk. The main parameters of this system are: the counter time resolution  $\sigma_t = 25$  ps, the material thickness is 0.1 radiation lengths, the geometrical thickness is 100 mm. At KEK Japan, spark counters with a time resolution  $\sigma_t = 150$  ps are planned as end cap counters for the TOPAZ detector. The status of these works is described. (Author abstract) 15 refs.

**076663 ANALOG CCD PIPELINE FOR ZEUS.** The ZEUS detector at HERA must have a fundamentally different trigger and data acquisition structure than other existing colliders. A pipelined structure is required because of the short (96 ns) bunch crossing interval, and the presence of a high, proton-related background. A beam-gas event rate  $> 10$  kHz is expected in the vicinity of the detector. The trigger and data acquisition pipelines for the calorimeter are described. A custom integrated circuit is required for the data acquisition pipeline, and both a CCD and a switched capacitor design effort is described. (Author abstract) 5 refs.

**Applications** See Also AEROSOLS—Atmospheric.

**076665 LARGE AREA MULTIWIRED CHAMBER  $\Delta E$ -E TELESCOPE FOR (n, Z) STUDIES IN A CONTINUOUS ENERGY NEUTRON BEAM.** Multi-wire chambers have been constructed for detecting reaction products created in a continuous energy neutron beam ranging from 15 to 50 MeV. The results achieved with the large area multiwire chamber  $\Delta E$ -E setup operated in the continuous energy neutron beam support the conclusion that neutron induced reactions on nuclei with small cross sections can be measured. The delay line readout for determining trajectories of charged reaction products represents an easy way for such low count-rate experiments. The quality of the spectroscopic information can be improved in the future by applying sodium iodide crystals for the determination of the residual energy of the charged reaction products. (Edited author abstract). 16 Refs.

**076667 CALIBRATIONS REQUIREMENTS AND METHODS FOR LIQUID-BORNE PARTICLE COUNTERS.** This paper describes present U.S. practices for calibrating optical liquid-borne particle counters (APCs). Operation of these instruments is described briefly for both light extinction and scattering instruments in order to help the reader understand why empirical calibration is necessary. Calibration requirements are pointed out in terms of the need to verify both particle sizing and particle counting accuracy. Two calibration methods are currently used in the U.S. One is based on size and count response to a suspension of sized isotropic latex spheres. The other is based on APC adjustment to match the stated size distribution of a test dust polydisperse suspension at a specific concentration. Both methods are described and some advantages and problems are presented. (Author abstract) 6 refs.

## Construction

**076671 CONSTRUCTION AND OPERATION OF A 3m $\times$ 1m DRIFT CHAMBER.** A description of a large area drift chamber used at LAMPF and currently in use at Fermilab is given. Chamber construction is presented, and electronics for both LAMPF and Fermilab are described. Parameters relating to both areas of operation are presented. Since these tests were generally performed with low energy particles, multiple scattering effects in the spectrometer are non-negligible. As a result, the measured spatial resolution of these chambers is generally an upper limit to the true resolution. Typical resolutions obtained with the daily line electronics were  $\pm 210$   $\mu$ m per plane averaged over the whole chamber during the np elastic scattering experiments. These data include a wide range of incident angles (up to approximately 45°). (Edited author abstract) 5 Refs.

**076674 DESIGN AND PERFORMANCE OF MODULARIZED NaI(Tl) DETECTORS WITH RECTANGULAR CRYSTAL ELEMENTS: AN ARRAY OF 49 AND THE CRYSTAL BOX.** An array of 49 NaI(Tl) modules each 20 inch in depth and 2.5 inch  $\times$  2.5 inch in cross section has been constructed and its properties, especially energy resolution, explored for positrons in the range 20 MeV-18 GeV. A subsequent much larger detector, the Crystal Box, has also been constructed from 396 modules of the same cross section, but mostly 12 inch in depth, and operated as a  $\gamma$ -ray and positron detector in a search for rare muon decays. The calibration procedure used for the Crystal Box and its characteristic resolutions in energy, impact point and time are described. (Author abstract) 6 refs.

Wilson, S.L. (Stanford Univ, Stanford, CA, USA); Hofstadter, R.; Hughes, E.B.; Lin, Y.C.; Parks, R.; Ritter, M.W.; Rolfe, J.; Bolton, R.D.; Bowman, J.D.; Cooper, M.D.; Frank, J.S.; Hallin, A.L.; Heusi, P.; Hoffman, C.M.; Hogan, G.E.; Mariam, F.G. *Nucl Instrum Methods Phys Res Sect A* v A264 n 2-3 Feb 15 1988 p 263-84.

**076675 CDF CENTRAL MUON DETECTOR.** Design, construction and performance characteristics of the streamer chambers for the central muon detector at CDF are described. A single hit TDC is used for measurements in the drift (azimuth) direction while charge division is used for measurements along the sense wire (pseudorapidity). The chambers operate in the limited streamer mode with a 50%/50% ratio of argon/ethane bubbled through ethanol. Measurements in a cosmic ray test stand, pion test beam and as part of the CDF detector indicate that an rms resolution of 250  $\mu$ m in the drift direction and an rms resolution of 1.2 mm along the sense wire are attainable. (Author abstract) 5 refs.

**076676 DESIGN AND CONSTRUCTION OF THE CDF CENTRAL TRACKING CHAMBER.** The Collider Detector at Fermilab (CDF) is a magnetic spectrometer surrounded by 4  $\pi$  electromagnetic and hadronic calorimeters. This report describes the design and construction of the Central Tracking Chamber (CTC) of the CDF detector which occupies most of the volume of the superconducting, solenoidal 1.5 T magnet. 7 refs.

Bedeschi, F. (Fermi Natl Accelerator Lab, Batavia, IL, USA); Berge, J.P.; Bofill, J.; Dell'Orso, M.; Foster, G.W.; Hrycyk, M.; Kadel, R.W.; Kowalski, J.; Mukherjee, A.; Newman-Holmes, C.; O'Meara, J.; Patrick, J.; Tinsley, D.; Wagner, R.L.; Yarema, R.; Byon, A. *Nucl Instrum Methods Phys Res Sect A* v A268 n 1 May 10 1988 p 50-74.

**076677 DESIGN AND CONSTRUCTION OF THE CDF CENTRAL DRIFT TUBE ARRAY.** The central drift tube (CDT) array is one of the charged particle tracking systems for the Collider Detector at Fermilab (CDF). The CDT array, which operates in the limited streamer mode, provides high-accuracy  $r$ - $\phi$ - $z$  information at a radius of 1.4 m for tracking charged particles produced in the central region (pseudorapidity range

$-1 < \eta < 21$ ) of  $\sqrt{s} = 1.8$  TeV  $\text{pp}$  collisions. Tracking of charged particles in the  $r$ - $z$  view of the CDT array is accomplished via charge division along the anode wires; drift-time measurements in three layers of the CDT array provide tracking information in the  $r$ - $\phi$  view. A novel design enabling rigid and precise mechanical support of 2016 3 m long, 12.7 mm diameter ultra-thin walled stainless steel drift tube has been implemented for the CDF central drift tube array. Details of the mechanical design and fabrication of the CDF central drift tube array are described. Some preliminary performance results of the operation of the CDT array obtained from  $\sqrt{s} = 1.8$  TeV  $\text{pp}$  collisions are also discussed. (Author abstract) 31 refs.

**076678 MEASUREMENT OF CASCADE SHOWERS IN LEAD WITH THERMOLUMINESCENT SHEETS.** A new type of detector, thermoluminescent (TL) sheets ( $\text{BaSO}_4/\text{Eu}$ ), and a readout system for the TL sheets have been developed to study electromagnetic cascade showers in ultrahigh energy interactions. To perform a measurement of showers recorded in TL sheets, the longitudinal and radial development of an electromagnetic cascade shower in lead produced by accelerator electrons has been studied for comparison. Simulations of the longitudinal and radial development of cascade showers were also performed using the EGS code system. This study is useful for the design of a thermoluminescent calorimeter (TLC) for the measurement of electromagnetic cascade showers originating from ultrahigh energy (above  $10^{15}$  eV) interactions. (Author abstract). 10 Refs.

Takahashi, Nobusuke (Okayama Univ of Science, Okayama, Jpn). *Nucl Instrum Methods Phys Res Sect A* v A270 n 2-3 Jul 15 1988 p 347-353.

**076679 NEW IDEA OF AUTOMATIC WALK STABILIZATION FOR CONSTANT FRACTION DISCRIMINATOR.** The idea of automatic walk stabilization for constant fraction discriminator based on compensated base line restoration is presented and tested. Comparison of this idea to gated base line restoration and other principles is discussed. It is simpler than gated base line restoration because the gated feedback loop for time equal to the input pulse width was replaced by the compensation of the input by the inverted from the LLD discriminator. The circuit is dc coupled and its operation is not limited by high frequency. The advantage of this idea in comparison to gated base line restoration is especially pronounced for very short input pulse width and high frequency when errors due to switched on/off times become important. (Edited author abstract). 10 Refs.

## Efficiency

**076680 GAMMA-RADIATION REGISTRATION EFFICIENCY OF HERRINGBONE ASSEMBLY OF MICROCHANNEL PLATES.** A study is made of the registration efficiency of a herringbone assembly of two microchannel plates (MCP) for gamma radiation from  $^{55}\text{Fe}$  (5.6 keV),  $^{241}\text{Am}$  (59.6 keV), and  $^{137}\text{Cs}$  (662 keV) as a function of plate thickness. The sources are calibrated by a scintillation detector with a  $\text{NaI}(\text{Ti})$  crystal and a proportional counter. The measurements are made in the pulse-count mode, and the registration threshold is approx.  $10^6$  electrons per pulse. It is shown that the optimum voltage, with regard to efficiency, on the first MCP for thin ( $< 1$  mm) MCPs is equal to the voltage of maximum amplification, while for thick (1-3 mm) MCPs, it is somewhat lower. The efficiency is measured as a function of the thickness of the first MCP, which varies within 0.7-3 mm. The maximum registration efficiencies are 2.5% for radiation with an energy of 5.9 keV, 25% for 59.6 keV, and 4% for 662 keV. (Author abstract) 7 refs.

**076681 QUANTUM EFFICIENCY OF A CHANNELTRON AND A MAGNETIC ELECTRON MULTIPLIER FOR 0.5-5 keV H ATOMS AND IONS.** The quantum efficiencies of a channeltron and a magnetic multiplier have been determined for 0.5-5 keV H atoms and ions. The efficiency of the detectors for ions is obtained by comparing its ion pulse rate with the ion pulse rate of a Daly detector. To determine the efficiency for atoms we partly converted the  $\text{H}^+$  beam into an  $\text{H}^0$  beam using a gas-cell for charge transfer. With this partly neutralized beam we found the efficiency for neutrals in two different ways. Firstly we measured the dependence of the ratio of the atom to ion pulse rate on the pressure in the gas-cell. From its maximum we can determine the absolute detector efficiency. Secondly we can determine the efficiency directly from a measurement of the ratio at a single pressure using the known differential cross sections. The two results are in good agreement. The magnetic electron multiplier has a lower efficiency than the channeltron. The efficiency for atoms is considerably smaller than for ions in the energy region below 1 keV. For both detectors the efficiency decreases when the energy of the particles comes below 1.5 keV. (Author abstract) 11 refs.

## Electric Field Effects

**076682 IMPROVEMENT OF THE ELECTRIC FIELD CORRECTION IN RECOIL-PROTON DETECTORS.** An improved correction for distortions of the electric field in recoil-proton detectors, applied in neutron energy spectrum measurements, was developed. It utilizes a simple analytical expression for the representation of the response function for the entire interval of the electric charge, thus avoiding the previous separate treatment of the upper 20 to 30% of the charge range. The simplicity of the functional expression for the response function allowed the integral equation of the unfolding problem to be solved analytically. This refined unfolding technique apparently provides a better solution, as it shows the spectrum deformation due to the large scattering resonances to be more pronounced. This highly accurate analytical unfolding procedure is likely to be applicable in other areas as well. (Author abstract) 6 refs.

## Electrodes

**076683 INVESTIGATION OF THE OPERATIONAL STABILITY OF PLASTIC STREAMER TUBES AFTER POLISHING OF THEIR GRAPHITE CATHODES.** In recent times plastic streamer tubes with resistive graphite cathodes have become very popular detectors. However, from experience gained it is established that detectors with a large cathode resistivity are rather unstable in operation. This instability shows up as a short counting plateau restricted by the appearance of self-sustaining discharges leading to large increases of the dark current. It is shown that the polishing of the graphite cathodes of plastic streamer tubes increases their operational stability. 9 refs.

**076686 PERSPECTIVES IN THE DESIGN OF TRANSFORMERLESS, LOW-NOISE FRONT-END ELECTRONICS FOR LARGE CAPACITANCE DETECTORS AND CALORIMETERS IN ELEMENTARY PARTICLE PHYSICS.** The achievement of adequate signal-to-noise ratios in the measurement of the energy released by ionizing particles in detectors of large capacitance such as, for instance, calorimeter cells, frequently relies upon transformer coupling between detector and preamplifier. Such a solution, however, may not be feasible if the detector is located in a strong magnetic field. This paper discusses the possibilities opened up by a recently developed field effect transistor for large gate area, whose design has been tailored to the applications in front-end preamplifiers for calorimeters and other large capacitance detectors of frequent use in elementary particle physics. **076688 ELECTRONICS FOR A Si-CsI(Tl)-PHOTODIODE MULTIDETECTOR SYSTEM.** Preamplifiers, computer-controlled main amplifiers and trigger electronics have been designed and built for our charged particle multidetector system (MDS). These electronics process signals from the individual detection elements of the MDS, each consisting of a silicon surface-barrier detector

and a CsI(Tl) scintillator with photodiode readout. Our design is compact, reliable, cheap, and well-suited for the multidetector system. (Author abstract) 3 refs.

**076689 CDF FRONT END ELECTRONICS: THE RABBIT SYSTEM.** A new crate-based front end system has been built featuring low cost, compact packaging, fast readout, command capability, 16 bit digitization, and a high degree of redundancy. The crate can contain a variety of instrumentation modules and is designed to be placed near the detector. Remote, special purpose processors direct the data readout. Channel-by-channel pedestal subtraction and threshold comparison in the crate allow the skipping of empty channels. The system is suitable for the readout of a very large number of channels. (Author abstract) 20 refs.

**076690 ON THE FEASIBILITY OF FRONT-END ELECTRONICS FOR MICROSTRIP VERTEX DETECTORS UNDER THE OPERATING CONDITIONS OF LARGE HADRON COLLIDERS.** In the workshops on future colliders the question is frequently raised as to whether the presently employed vertex detectors could cope or not with the very short time intervals between bunch crossings at which the large hadron colliders will operate. Silicon microstrip detectors seems to be suitable for the purpose as they have charge collection times in the ns region. The question of the feasibility of a front-end electronics, able to provide an adequately large signal-to-noise ratio under the operating conditions of future hadron colliders is, however, still open. This paper aims at showing that a front-end employing GaAs MESFETs or silicon microwave bipolar transistors as low noise devices may allow a reliable signal detection with silicon microstrips down to a few tens of nanoseconds interval between bunch crossings. (Author abstract) 6 refs.

**076691 FAST TRACK FINDING TRIGGER PROCESSOR FOR THE BES DETECTOR.** The Beijing Spectrometer (BES) is being designed and constructed for use at the Beijing  $2 \times 2.8$  GeV center-of-mass energy electron-positron collider (BEPC). The BES detector will have approximately 20K channels of electronics, and the beam collision rate will be 1.25 MHz, corresponding to a luminosity of  $10^{30} \cdot 10^{31} \text{ cm}^{-2} \text{ s}^{-1}$ . A fast programmable track finding processor to be used in the second level trigger is described. This processor, mainly consisting of 3 out of 4 logic and track finding logic, is simple and flexible. Only 96 pieces of  $4K \times 1$  bit random access memory (RAM) chips are used for the track finding logic on 4 layers of the main drift chamber. (Author abstract)

## Instruments

**076693 EXPERIMENTAL APPARATUS FOR STUDY OF POLARIZATION EFFECTS IN CHARGE-EXCHANGE REACTIONS OF CHARGED MESONS TO NEUTRAL FINAL STATES.** Apparatus is described for study of polarization effects in exclusive charge-exchange reactions of  $\pi^-$  and  $K^-$  mesons to neutral final states that decay to gamma quanta. The gamma quanta are registered by a total-absorption Cerenkov spectrometer based on lead-glass counters. The apparatus has been used to study asymmetry in the charge-exchange reactions  $\pi^- p \rightarrow (\pi^0, \eta, \eta', \omega, f) + N$ ,  $\pi^- p \rightarrow K^0 \Lambda$ , and  $K^- p \rightarrow K^0 \Lambda$ . (Author abstract) 16 refs.

## Laser Applications

**076694 STUDY OF THE SELF-QUENCHED STREAMER MODE USING A NITROGEN LASER.** The characteristics and mechanism of the self-quenched streamer mode have been explored using laser induced ionization. Both the size of the streamer signal and the transformation from proportional to streamer mode depend on high voltage and the primary ionization density. Two nearby tracks influence each other mainly by space charge effects. The zone of influence depends on relative drift time of the tracks but is less than 3 mm along the anode. The influence is less with argon-free strong quenching gas mixtures. (Author abstract) 8 refs.

**076697 PERMEATION THROUGH LATENT NUCLEAR TRACKS IN POLYMER FOILS.** The stable defects created in most dielectrics by fast heavy ions, called 'latent nuclear tracks', are zones of reduced density. Using the small-angle neutron-scattering technique it is shown that water molecules which permeate a polymer foil are preferentially embedded in these zones. In the track region the diffusion- and the sorption coefficients for various atoms and molecules are larger than in unirradiated material. In the damaged region of tracks produced by uranium ions in polyethylene terephthalate (PETP) the permeability for neon, oxygen, argon, carbon-dioxide, and water is enhanced by factors between 60 and 290. A method for the preferential etching of latent nuclear tracks in PETP using methanol as a solvent is suggested. (Author abstract) 11 refs.

## Monitoring

**076699 LUMINOSITY MONITOR FOR THE VENUS DETECTOR AT TRISTAN.** We constructed a luminosity monitor of the lead-scintillator sandwich type for the VENUS detector at the  $e^+e^-$  collider TRISTAN. Photomultiplier tubes with transmissive mesh dynodes could be operated fairly well in a high magnetic field and hence the readout optics system was considerably simplified. We present the performance of the luminosity monitor for  $e^+e^-$  collisions at  $\sqrt{s}=50$  and 52 GeV. (Author abstract). 10 Refs.

Performance See Also SPECTROMETERS—Design.

**076700 EFFECT OF OXYGEN ON RESPONSE OF PLASTIC AND GLASS DETECTORS.** Using beams of relativistic Au and U ions, we have found that the sensitivity (reduced track etch rate) of CR-39, Rodyne polycarbonate, and Cronar polyester track detectors depends on the length of time for which the sample is exposed to oxygen before irradiation and to the partial pressure of oxygen before and during irradiation. In contrast, the sensitivity of VG-13 phosphate glass detectors is independent of the presence or absence of oxygen before or during irradiation. (Author abstract) 10 refs.

**076701 DETECTOR FOR REGISTRATION OF IONS, ELECTRONS, AND NEUTRAL PARTICLES OF LASER PLASMA.** A detector is described for measurement of ion and electron currents as well as the energy of neutral particles of laser plasma in the same angular aperture. Good agreement is observed between the ion signal of the detector and the ion current of a Faraday cylinder, which permits absolute measurements. A method is proposed for measurement of the average ratio of the mass of an ion to its charge. Data on ion and neutral-particle energy are given and the energy removed by fast electrons is estimated. (Author abstract) 13 refs.

Komarov, V.M. *Instrum Exp Tech* v 30 n 1 pt 2 Jan-Feb 1987 p 175-178.

**076702 SOME OPERATING CHARACTERISTICS OF HERRINGBONE MICROCHANNEL AMPLIFIERS.** The parameters of a herringbone microchannel amplifier are studied as functions of the input signal intensity and the size of the microchannel-plate (MCP) working zones, i.e., the number of actually functioning channels. The sensitivity of the microchannel amplifier to overloads was found to be the higher, the greater the number of functioning channels, and the maximum count rate at the output of a single channel was obtained with the smallest MCP working-zone area (in this case, the channel dead time was approx. 0.3 msec). The dead times of the individual channels can vary according to the irradiation conditions, which allows considerable expansion of the sensitivity dynamic range by changing the dimensions of the MCP input surface with variation of the input signal intensity. (Author abstract) 8 refs.

**076703 MULTIPLICITY REGISTRATION IN HODOSCOPE SYSTEMS WITH A LARGE NUMBER OF REGISTRATION CHANNELS.** A method is described in which data are compressed before analysis for multiplicity  $t$  and high-speed PROMs are used. Schematic diagrams are given for the main units of a 64-input device, which permits determination of such multiplicity parameters as  $t=1$ ,  $t=2$ ,  $t=3$ ,  $t=4$ , and  $t \geq 5$  with a delay of  $\leq 35$  nsec. (Author abstract) 9 refs.

Nikityuk, N.M. (Joint Inst for Nuclear Research, Dubna, USSR). *Instrum Exp Tech* v 30 n 3 pt 1 May-Jun 1987 p 559-566.

**076704 DEVICE FOR RECORDING PARTICLE AND PHOTON FLUX DISTRIBUTIONS.** The device described has been designed to record the spatial distribution of particle and photon fluxes in a vacuum. An assembly of a microchannel plate and a luminescence screen on a fiber-optic wafer serves as the detector of the primary flux of particles or photons. The luminescence of the phosphor is recorded by a moving line charge-coupled video-signal sensor controlled by an electronic circuit in the CAMAC standard. The spatial resolution of the instrument is 0.1 mm. (Author abstract) 7 refs.

**076705 DETECTORS OF SHORT-RANGE PARTICLES BASED ON NEUTRON-TRANSMUTATION-DOPED SILICON.** The suitability of neutron-transmutation silicon (NTS) produced without preselection of the starting p-type silicon for precision alpha spectrometry is studied. Use as a starting material of p-type silicon with resistivity  $\rho_p = 2-80$  k $\Omega$ ·cm provides NTS with  $\rho_n \approx 1-25$  k $\Omega$ ·cm; specimens with  $\rho_n \leq 5$  k $\Omega$ ·cm have sufficiently high homogeneity, which ensures an energy resolution of 12-14 keV. The nature of charge transfer in NTS with  $\rho_n \approx 10-25$  k $\Omega$ ·cm indicates the existence of local regions of increased compensation (Approximately 1 M $\Omega$ ·cm). To ensure high energy resolution, the detector must operate in the total-depletion

mode. It is shown that the value of  $\rho_n$ , which is determined by the four-probe method, does not allow prediction of the thickness of the sensitive region of detectors made of high-resistivity NTS, since the presence of deep centers in the material is not taken into account. (Author abstract) 12 refs.

**076706 RECOIL-PARTICLE DETECTOR FOR BIS-2 SPECTROMETER OF JOINT INSTITUTE FOR NUCLEAR RESEARCH.** A recoil-particle detector designed for determination of the angle of proton escape in the reaction  $np \rightarrow (\Lambda^0 K^0)p$  is developed for study of the process of neutron dissociation to the system  $\Lambda^0 K^0$  with the aid of the BIS-2 spectrometer. The detector consists of two coaxial cylindrical hodoscopes of 18 scintillation counters each. An iron filter of variable thickness is placed between the counters for sampling of events in various ranges of recoil-proton energy. The detector is used in conjunction with a liquid-hydrogen target or a sectional target detector. The design features and characteristics of the detector are given. A method is proposed for separation of interactions of beam neutrons with the hydrogen and with the structural elements of the target. (Edited author abstract) 8 refs.

## Radiation Damage

**076712 INFLUENCE OF FAST NEUTRON IRRADIATION ON THE NOISE PERFORMANCE OF SILICON SURFACE-BARRIER DETECTORS.** The susceptibility to fast neutron irradiation of silicon surface barrier detectors has been investigated. It was shown that the 1/f noise component decreases substantially with increasing fluence in the range from  $10^{10}$  n/cm<sup>2</sup> to  $10^{11}$  n/cm<sup>2</sup>. The deterioration of the detector performance occurs mainly due to the formation of radiation-induced positively charged defects. The critical value of neutron fluence at which the detector performance begins to worsen was also determined. (Author abstract). 5 Refs.

Dabrowski, Wladyslaw (Acad of Mining & Metallurgy, Cracow, Pol); Korbel, Kazimierz. *Nucl Instrum Methods Phys Res Sect A* v A271 n 3 Sep 1988 p 585-587.

**076713 RADIATION DAMAGE IN SILICON MICROSTRIP DETECTORS.** A radiation damage effect on silicon strip detectors of pn-junction type is investigated using a high energy proton beam. In order to clarify the cause of leakage current increase, several variations of strip detectors with different surface structures were made and tested. No appreciable differences in leakage current increase are observed among these samples. A strong temperature dependence on leakage current is observed. This can be explained by a formation of radiation induced trap energy levels in the bulk silicon. A moderate room temperature annealing is seen. A pulse height degradation of about 10-20% is observed at a few Mrad of radiation. Some implications of the present results are discussed for possible application of silicon semiconductor detectors in future high energy hadron colliders. (Author abstract) 21 refs.

(Hiroshima Univ, Hiroshima, Jpn); Taketani, A.; Noda, M.; Chiba, Y.; Asai, M.; Kondo, T.; Sato, T.; Takasaki, M.; Tanaka, K.H.; Kondo, K.; Hirayama, H.; Yamamoto, K.; Tanaka, H. *Nucl Instrum Methods Phys Res Sect A* v A265 n 1-2 Mar 1 1988, Adv in Exp Methods for Colliding Beam Phys, Stanford, CA, USA, Mar 9-13 1987 p 105-111.

## Radiation Effects

**076714 RESPONSE OF LR-115 TYPE II AND CR-39 PLASTIC TRACK DETECTORS TO Am-Be AND 14.1-MeV NEUTRONS.** The fast-neutron response of the plastic LR-115 type II and CR-39 track detectors have been compared, using a 14.1-MeV neutron generator and a radionuclide Am-Be neutron source (effective primary neutron energy 4.5-MeV). The distribution of track diameters for a range of etching times has been evaluated, taking into account track registration efficiency and the relevant fast neutron scattering cross-sections. The efficiency of etched-track formation in LR-115 type II due to neutron irradiation is approximately double that in CR-39. The 14.1-MeV neutrons also tend to produce tracks in both materials with somewhat greater efficiency than do the lower energy neutrons from the radionuclide source, for a given etching time. (Author abstract) 25 refs.

## Testing

**076717 TEST RESULTS FROM A PRECISION DRIFT CHAMBER VERTEX DETECTOR PROTOTYPE USING DIMETHYL ETHER.** Results of beam tests of a prototype drift chamber vertex detector developed for the D-Zero experiment at the Fermilab collider are reported. The chamber design emphasizes dual goals of high accuracy position measurement and excellent two-track resolution. These requirements are met by using a slow gas, dimethyl ether, in a jet chamber geometry with a double plane of field-shaping wires near the anodes. Resolution of nearby hits is facilitated by 100 MHz flash digitization of the signal pulses. The prototype tested consisted of a full-length (97 cm) model of one azimuthal sector of the innermost layer of the detector, with 8 anode wires. Position measurement accuracy of 30-80  $\mu$ m for drift distances of 2-11 mm and pulse pair resolution of 0.7 mm (for 90% of all pulses) is achieved. (Author abstract) 7 refs.

**076722 NONLINEAR BEAM OPTICS WITH REAL FIELDS IN COMPACT STORAGE RINGS.** We analyze the proposed Karlsruhe electron storage ring for X-ray in-depth lithography using the 3rd order charged particle beam transport code MARYLIE 3.0. The ring features four 90° superconducting bending magnets. A numerical calculation of their field provides the longitudinal dependence of the multipole expansion coefficients. These are used by the code SCB to compute the Lie algebraic transfer map. Subsequent particle tracking with MARYLIE is employed to find dynamic apertures. Two different magnet designs which both lead to satisfactory dynamic apertures are presented. (Author abstract) 15 refs.

Karlsruhe, West Ger); Krevet, Berthold; Dragt, Alex J. *Nucl Instrum Methods Phys Res Sect B* v B30 n 1 Feb 1988 p 105-109.

**076723 EMPIRICAL TREATMENT OF NONRELATIVISTIC PROTON BEAM SPREADING.** Transverse spreading in proton transmission microscopy limits to some degree the amount of resolution that is possible from the beam. A semi-empirical expression is given which estimates the lateral displacement of a proton beam as it passes through a material. The angular deflections are assumed to be primarily due to small angle Coulomb interactions. The expression includes a proportionality constant which is evaluated with the TRIM ion transport code. The results are compared to experimental data when available. (Author abstract) 7 refs.

**076726 SIMULTANEOUS COMPENSATION OF 2ND-ORDER PARASITIC ABERRATIONS IN BOTH PRINCIPLE SECTIONS OF AN ACHROMATIC QUADRUPOLE LENS DOUBLET.** Experimental measurements are made of the aberrations of a doublet of achromatic quadrupole lenses. Second-order terms are altered and eliminated. Adjustment is guided by a theoretical model containing dipole and hexapole terms. Fixed hexapole terms of unknown magnitude arising from the inherent imperfect symmetry of lens construction cause the parasitic aberrations. Variable hexapole terms, caused by 2-pole electric excitations, are used to achieve compensation. The variable terms are adjusted to null the total hexapole field of each lens, leaving a small dipole field. (Edited author abstract) 23 refs.

**076728 DESIGN OF A VERSATILE SCANNING PROTON MICROPROBE OF HIGH RESOLUTION AND EFFICIENCY.** The designer of a scanning proton (or nuclear) microprobe must make many decisions, some of which may be compromises. There is a wide range of lens types and configurations. Microprobe performance will depend on performance of the accelerator and its ion source, on stability and control of the lens current supply, on the nature of the microprobe supports, on the vacuum system, on magnetic shielding and connection to the accelerator. There are many possible modes of observation and analysis to be considered when the specimen chamber is designed and a versatile chamber should make provision for most of them. They include optical microscopy of front and back surfaces of the specimen, secondary electron imaging, X-Ray imaging, channeling contrast microscopy. Rutherford backscattering and forward scattering, nuclear reaction analysis and scanning transmission ion microscopy in brightfield and darkfield modes. (Edited author abstract) 26 refs.

**076729 ACTIVITIES FOR THE CONSTRUCTION OF A NEW HEIDELBERG PROTON MICROPROBE.** A new microprobe system is described which will provide easier operation, especially for outsider, users, a micro- and macro-PIXE facility, improved accuracy for quantitative analysis and an improved scanning system. The probe will have crossed slits as object, a magnetic quadrupole doublet lens and electrostatic deflector plates. Ion optical calculations were done up to third order, using the TRANSPORT and OXRAY computer programs. The image spot size is investigated as function of the geometrical arrangement. A collimation line has so far been built. The scattering of slit edges of the geometrical shape used in the old microprobe is compared with the scattering at the edges of the simpler cylindrical shape. The latter proved to be slightly superior. (Author abstract) 12 refs.

**076730 HEAVY-ION MICROPROBE AT GSI - USED FOR SINGLE ION MICROMECHANICS.** Etching of nuclear tracks can yield unique microscopic structures of technical interest in a wide range of different materials. This has already led to many applications using extended beams. Now the heavy ion microprobe has for the first time been used to create micropatterns by shooting every single ion to its desired position. The paper will describe the components of the microprobe essential to the new technique, give an overview over the basic geometries of single ion micromechanics, and show the result of a first experiment. (Author abstract) 6 refs.

**076731 CHARGED PARTICLE OPTICS, PROCEEDINGS OF THE SECOND INTERNATIONAL CONFERENCE.** This conference proceedings contains 39 papers, all of which are separately indexed and abstracted. The papers concern charged particle optics. Mass spectrometers and separators are reviewed. Hamiltonian optics, aberrations, and codes are considered. Several papers discuss microbeams and lithography. Accelerators, storage rings, light optics, and high intensity beams are also discussed. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11404 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

**076732 ION OPTICS OF A NEW TOF MASS SPECTROMETER IN THE THIRD ORDER APPROXIMATION.** The ion optics of a time of flight mass spectrometer with multiple focusing were studied. Triple isochronous focusing and triple space focusing were achieved simultaneously by the symmetrical arrangement of either two or four electric sector fields. A new time of flight mass spectrometer consisting of four 269° electric sector fields was constructed. The flight length of the system is 1.727 m, even though the diameter of the vacuum chamber is 0.41 m. A peak width (fwhm) of 18 ns at  $m/z = 132$  was obtained using a pulsed electron impact ion source (fwhm 15 ns). TOF mass spectra of heavy biomolecules for example, gramicidin S (M.W. 1140) and angiotensin III (M.W. 930) were obtained using a SLMS-type ion source. (Author abstract) 6 refs.

**076733 STUDY OF THE ABERRATIONS OF PERIODIC ARC USING THE LIE ALGEBRAIC TECHNIQUES.** Since the introduction of second order matrix methods in accelerator physics, algebraic expressions for the matrix have been used in designing systems with little aberration. Our purpose is to show how one can use a Lie algebraic representation to gain additional insight. The aberrations of a periodic achromat are analyzed using the map of a single periodic cell. An action-angle analysis of the Lie operators describing a cell is used to illustrate the differences amongst various phase advances per cell. (Edited author abstract) 6 refs.

**076734 HAMILTONIAN MAGNETIC OPTICS.** This paper outlines a procedure for systematically calculating the paraxial imaging properties and the aberrations of arbitrary static magnetic fields. Since the method is based on general considerations, it can readily be extended to electromagnetic fields. The aberrations are obtained by determining the expansion terms  $E^{(i)}$  of the perturbation cikon. These terms represent polynomials of degree  $i$  in the four geometrical ray parameters  $a$ , and the chromatic parameter  $c$ . 19 refs.

Rose, H. (Technische Hochschule Darmstadt, Darmstadt, West Ger). *Nucl Instrum Methods Phys Res Sect A* v A258 n 3 Aug 15 1987, Charged Part Opt, Proc of the Second Int Conf, Albuquerque, NM, USA, May 19-23 1986 p 374-401.

**076735 TWO DOGMAS OF CHARGED PARTICLE OPTICS.** Designs of charged particle optical systems are invariably based on two assumption: (1) The existence of a reference trajectory and (2) midplane symmetry. The reference trajectory is taken to be the path of a charged particle with certain specified initial conditions. Conditions which break the continuity of the reference trajectory are misalignments of magnets, excess horizontal field in a bending magnet, and vertically bending field in a horizontally bending magnet. Even if midplane symmetry is violated in a magnetic system it is usually respected in each magnetic element. Violations of midplane symmetry in a bending magnet occur if the field is not symmetric about the magnetic midplane. Equations of motion have been worked out for the case where both the above mentioned conditions are violated. Solutions have been produced and incorporated into the first- and second-order formalism of charged particle optics. (Author abstract) 5 refs.

**076736 ION OPTICS OF MULTIPOLES.** Properties and applications of various kinds of multipoles, in use in mass spectrometry, are discussed; i.e., magnetic as well as electric dipoles and their combinations, quadrupole lenses, hexapole and octupoles. After a short mathematical interlude the dodecapole (12-pole) is introduced: By a proper potential distribution upon the twelve electrodes, it can act as a dipole in an arbitrary direction; as a quadrupole lens, again in an arbitrary direction; as a hexapole; as an octupole; or as a (linear) combination of these devices. An additional feature, however, is the property of the dodecapole with equal potential on all rods, to act as an einzel lens. In combination with the quadrupole lens function the dodecapole become a unique device which can act as a lens focusing in any two mutually perpendicular directions with independent focal strengths. (Author abstract) 12 refs.

**076737 METHOD OF POWER SERIES TRACKING FOR THE MATHEMATICAL DESCRIPTION OF BEAM DYNAMICS.** A new method to compute the properties of charged particle optics systems is presented. It is based on the application of operators and functions to a power series algebra instead of real numbers. The method is as versatile as numerical integration methods and comparable to matrix methods in speed and accuracy thus combining the advantages of both strategies. The method has been implemented through fifth order in the code POWERTRACK. Due to the generality of the method, the order can be increased with very little programming effort. (Author abstract) 13 refs.

**076738 ON THE ION OPTICS OF DIPOLE MAGNETS WITH PARALLEL ENDS INCLUDING STRAY FIELD EFFECTS.** A procedure is developed that allows computing the ion optical transformation matrix of homogeneous dipole magnets with parallel end contours, taking fully into account the effect of the stray fields upon them without approximations. Using the measured field distribution a solution of the equations of motion of the reference particle on the central trajectory is given. Knowing the reference path it is then possible to transform the measured field into the curved coordinate system of ion optics and to derive the differential equations of the matrix elements whose solutions are formulated explicitly in the dispersive plane. In addition, the generally valid differential equations of motion of an arbitrary particle in phase space in the curved coordinate system are derived, explicitly giving the second derivative of the particle's coordinates with respect to the arc length  $s$  of the central trajectory. (Edited author abstract) 6 refs.

**076739 SPACE-CHARGE AND THIRD-ORDER ABERRATIONS IN QUADRUPOLE FOCUSING SYSTEMS.** The purpose of the author is to consider third-order aberrations due to space charge. He derives the single-particle equations of transverse motion for a beam of elliptical cross section that propagates down a focusing channel. These equations include electric and magnetic fields cause by space and magnetic fields caused by quadrupoles and octupoles. The author then calculates

the third-order aberrations of a point-to-parallel system and suggests that beam sizes should be minimized in order to control aberrations. (Author abstract) 8 refs.

**076740 SOME APPLICATIONS OF PARTICLE-IN-CELL CODES TO PROBLEMS OF HIGH INTENSITY BEAMS.** The purpose of this paper is to demonstrate the application of the 'particle-in-cell' or PIC code method to problems of intense charged particle beams. The PIC code method is most powerful when applied to problems involving rapid transients, as in a pulsed beam, or with rf fields, as in a line buncher or a klystron. 13 refs.

## Computer Aided Analysis

**076741 COSY 5.0 - THE FIFTH ORDER CODE FOR CORPUSCULAR OPTICAL SYSTEMS.** COSY 5.0 is a new computer code for the design of corpuscular optical systems based on the principle of transfer matrices. The particle optical calculations include all image aberrations through fifth order. COSY 5.0 uses canonical coordinates and exploits the symplectic condition to increase the speed of computation. COSY 5.0 contains a library for the computation of matrix elements of all commonly used corpuscular optical elements such as electric and magnetic multipoles and sector fields. The corresponding formulas were generated algebraically by the computer code HAMILTON. Care was taken that the optimization of optical elements is achieved with minimal numerical effort. Finally COSY 5.0 has a very general mnemonic input code resembling a higher programming language. (Author abstract) 10 refs.

## Mathematical Models See Also EQUATIONS OF MOTION.

**076743 LINEAR ION OPTICS MODEL FOR EXTRACTION FROM A PLASMA ION SOURCE.** A linear ions optics model for ion extraction from a plasma ion source is presented, based on the paraxial equations which account for lens effects, space charge and finite source ion temperature. This model is applied to three- and four-electrode extraction systems with circular apertures. The results are compared with experimental data and numerical calculations in the literature. It is shown that the improved calculations of space charge effects and lens effects allow better agreement to be obtained than in earlier linear optics models. A principal result is that the model presented here describes the dependence of the optimum permeance on the aspect ratio in a manner similar to the nonlinear optics theory. (Author abstract) 23 refs.

## Performance See Also ELECTROSTATIC LENSES —Performance.

**076744 ANALYSIS OF MECHANICAL ABERRATIONS IN THE ELECTROSTATIC DEFLECTOR.** A third-order aberration formula of mechanical aberrations due to various errors in assembling or machining of the electrostatic deflector is derived from a second-order perturbation theory. Mechanical aberrations in a magnetic focusing and electrostatic deflection system are analyzed by utilizing this new formula. The results show that the electrostatic deflector suffers, in general, more serious effects from errors in machining than in assembling if the error magnitudes are almost the same, and also that the edge of the deflection electrodes where the electric field concentrates exerts a greater influence upon occurrence of mechanical aberrations than other portions with less electric field. It is also ascertained that the octopole deflector is much superior to the quadrupole regarding misalignment through numerical comparison between both deflectors. (Author abstract) 10 refs.

**076745 OPTICAL MEASUREMENTS OF PARTICLE SIZE AND CONCENTRATION IN DENSELY LADEN MEDIA USING A VISIBLE/INFRARED DOUBLE EXTINCTION TECHNIQUE.** Measurements of sizes and concentrations of coal particles in densely laden media are carried out by means of a visible/infrared double extinction technique and the underlying theory is explained. It is shown that simultaneous sizing and concentration measurements can be obtained by recording the transmittances of the medium under study at two well chosen wavelengths simultaneously (for instance in the visible and in the far infrared ranges). Experimental results for coal particles sieved between 20 and 80  $\mu\text{m}$  are described and discussed. (Edited author abstract) 46 refs.

**076746 RAISING THE INTERFERENCE IMMUNITY OF BIOTECHNICAL MEASURING SYSTEMS.** An analysis is given of the possibilities of using integrated microcircuit technology to raise the interfer-

ence immunity of electrophysiological measurements from the surface of a bioobject. The authors also examine the question of raising the interference-immunity of the system and circuit engineering methods that will permit utilization of microelectronic facilities. A measuring system with elevated cophasal interference immunity was developed and fabricated using a voltage-to-frequency converter (VFC) in the input section. A HIS consisting of a differential amplifier and VFC was installed in an electrode and a modulated signal was transmitted along the communications line. Test results of microelectric secondary transducers developed and fabricated by the authors permit raising the cophasal interference-immunity factor by 4-5 times. 10 refs.

Bannikov, S.Yu.; Podlepetskii, B.I. *Meas Tech* v 29 n 1 Jan 1986 p 61-64.

**076747 RAISING THE RESOLVING POWER OF OPTICAL AND ELECTRICAL PARTICLE ANALYSES BY USING DIVERGENT DEFLECTING PLATES.** The authors consider the increase in resolving power on using plates diverging at a certain angle by comparison with parallel ones with fixed dimensions for the unit and with given charging and deflecting voltages. A numerical method has been used to derive the set of points given the minimum in the total energy. As F approaches a value close to 0.0681, the stability condition deteriorates rapidly. Therefore, it is necessary to provide  $F \leq 0.068$  for the sorter to work stably. With this constraint, there is no sharp increase in the coefficient  $k_m = E_{\text{max}}/E_0$  for the field strength at the boundary of the ellipsoid by comparison with a spherical drop. The actual parameters of the sorter built in accordance with the calculations were in good agreement with the theoretical ones. These results can be used in designing sorters for optical and electrical particle flow analyzers. 12 refs.

Ovod, V.I.; Shlyuko, V.Ya. *Meas Tech* v 29 n 1 Jan 1986 p 65-68.

**076748 AUTOMATIC IMAGE ANALYSIS TECHNIQUE FOR THE QUANTITATIVE PARTICLE SIZE CLASSIFICATION OF INHOMOGENEOUS AND SUPERIMPOSED SECOND PHASES.** Quantitative verification of microstructural changes occurring during heat treatments, welding operations, or service at high temperatures requires careful, detailed study if very small size particles are to be investigated and if the variability within the material is to be measured and understood. Studies on microstructural changes observed in 2 1/4 Cr-1 Mo steel components during high-temperature service stimulated the development of an automatic image analysis technique to characterize the morphology of the very small carbides. This technique was based on size classification of precipitates visible on extraction replicas. It was demonstrated that a valid evaluation of significant differences among samples could be computed by utilizing measurements of the area fraction of carbides included in each size class in relation to the total area of extracted carbides. (Edited author abstract) 8 refs.

**076749 PARTICLE SIZE DISTRIBUTIONS IN CLEAN ROOMS.** Measurements of particle size distributions smaller than 0.1  $\mu\text{m}$  in Class 100 clean rooms are summarized. The size distributions were measured in operational rooms during periods of time with little activity - the so-called 'at rest' conditions. A simple particle number balance model is proposed, illustrating the importance of filter penetration and atmospheric aerosol on the concentration of submicrometer particles. Preliminary calculations are used to explain the absence of <0.1  $\mu\text{m}$  diameter particles in the clean rooms tested. A ratio of condensation nucleus counter concentration to optical particle encounter concentration is suggested as a

parameter to provide an indication of changes in clean room particle size distribution. (Author abstract) 22 refs.

**076750 COMMERCIAL DEVELOPMENT OF AN ON-LINE GRAIN-SIZE MONITOR.** This paper traces the development of the BNF grain-size monitor from the earliest concept to a saleable commercial instrument. The paper explains the importance of grain size in annealed copper alloy strip and highlights the drawbacks associated with the traditional methods of grain-size measurement. The new unit, which recently became commercially available to industry, enables grain size to be determined non-destructively and instantaneously on-line, making possible swift adjustment to process controls. (Edited author abstract)

Johnston, R.D. (BNF Metals Technology Cent, Wantage, Engl); Diamond, R.D. *Int J Technol Manage* v 3 n 1-2 1988 p 21-29.

**076751 STRUCTURAL ANALYSIS OF POROUS MATERIALS BY MEANS OF MERCURY POROSIMETRY.** In this paper, the determination of pore size distribution, specific surface and porosity of porous materials by means of mercury porosimetry are described. The principles and experimental results on the determination of particle size are discussed. The hysteresis and its applications in the structural analysis of porous materials are investigated. (Author abstract) In Chinese. 7 refs.

**076752 ON-LINE PARTICLE SAMPLING AND MEASUREMENT SYSTEM.** The technology for measuring particulates has been available to industry for many years. Until now, however, a significant time lapse occurred between sample acquisition, sample analysis, and feedback to production personnel. This delay in obtaining the particulate-diameter data voided any 'real-time' control of the process. With this method, control was adjusted by using wide setpoint guidelines. An on-line particle size measurement system now exists that eliminates the time delay between sample acquisition and feedback. By combining existing particulate measurement equipment with automatic sample extraction equipment, which is located in the process production area, the system allows real-time particulate data to be produced. This paper describes the equipment that composes the system, explains system operation, and discusses benefits and costs. (Author abstract) 3 refs.

Rice, Grant (InterSystems Inc); Kreikebaum, Gerhard. *Powder Bulk Eng* v 1 n 2 Feb 1987 p 30-34.

**076753 REALIZATION OF A CONCEPT OF THE COMPLETE EVALUATION OF DOUBLE PULSE HOLOGRAMS OF PARTICULATE PHASES IN FLOWS.** Double pulse holography is, for experimental investigations, an extremely valuable means of measuring transport processes in disperse phases. This method allows the single or two dimensional frequency distributions of particle size, velocity, momentum and energy to be determined of each recorded sub-collective, with the additional possibility of checking the existence of their correlation. Being an imaging method, the distributions of the particle in space can be displayed along with the instantaneous values of the concentration and particle flux density. A complete and very exact evaluation of the holographic images, coupled with the certainty of image pairing, is one of the prerequisites of a successful application. The best evaluation in this sense is, at present, produced by a semi-automatic, interactive system in which the assessment of certain crucial factors is left to an operator. Although the effort incurred by such a total evaluation is by no means insignificant, it is justified by the profusion of information to be obtained. The present report explains the whole concept including a program system with which the primary data is further processed and with which a variety of results may be called up and

displayed. (Author abstract) 36 refs.

Schaefer, Michael (Univ Karlsruhe, Karlsruhe, West Ger); Umhauer, Heinz. *Part Charact* v 4 n 4 Dec 1987 p 166-174.

**076754 FLUORESCENCE PROBE STUDY OF THE EFFECT OF SIZE ON THE PROPERTIES OF DIOCTADECYLDIMETHYLAMMONIUM CHLORIDE VESICLES.** Fluorescence techniques are used to study the effect of size on the properties of dioctadecyldimethylammonium chloride vesicles. The results obtained are accounted for by considering the structural differences between large and small vesicles. It is shown that the temperature dependence of the interaction rate between the probe and oxygen can be used to monitor the changes in vesicle fluidity accompanying the gel-liquid crystalline phase transition and the sensitivity of the fluidity and phase transition temperature to the incorporation of additives (n-octanol). The effect of vesicle size upon the capacity to incorporate n-alkanols (from hexanol to nonanol) and carbon tetrachloride was also examined. (Edited author abstract) 22 refs.

**076755 INFLUENCE OF PARTICLE SHAPE ON SIZE MEASURED BY THE LIGHT-BLOCKAGE TECHNIQUE.** Five alumina particles, each of different shape, were independently and repeatedly dropped through the light beam in a Hiac-Royco particle counter which deduces the size of the particle from the amount of light blocked. The sizes of those particles were also measured by use of a Quantimet image analyzer which determines size (diameter) from the area projected by the particle as it lies 'flat'. When the diameter of a flake-like particle is measured, the former instrument shows more variability in results than the latter. Aside from flake-like particles, close correlations are shown between the two different ways of measuring particle size. From one instrument to the other, a correlation is shown between increased variability of size measurements with increased departure of the particle from the shape of a sphere. (Edited author abstract) 8 refs.

**076756 DESCRIPTION OF NORMAL, LOG-NORMAL AND ROSIN-RAMMLER PARTICLE POPULATIONS BY A MODIFIED VERSION OF THE BETA DISTRIBUTION FUNCTION.** Data generated by the normal, log-normal and Rosin-Rammler distribution functions were normalized and fitted with a modified version of the beta distribution function. As long as the frequency function had a zero or practically zero value at the two ends of a finite size range, the fitted curves were indistinguishable from the normal and Rosin-Rammler distributions. The fit of the modified beta function to narrow log-normal distributions was also excellent but declined as the distribution spread increased. It appears that for real particle populations having a finite size range and not necessarily a perfectly smooth size distribution, the modified beta function can replace all three functions, thus providing a way to compare different size distribution patterns in terms of a single mathematical expression. (Edited author abstract) 4 refs.

Popplewell, L.M. (Univ of Massachusetts, Amherst, MA, USA); Campanella, O.H.; Normand, M.D.; Peleg, M. *Powder Technol* v 54 n 2 Feb 1988 p 119-125.

**076757 COMPARISON BETWEEN A MODIFIED BETA AND A MODIFIED NORMAL DISTRIBUTION FUNCTION FOR THE DESCRIPTION OF POPULATIONS WITH A FINITE SIZE RANGE.** It has been demonstrated in a recent communication that the particle size distribution of particle populations having finite size range and a mode that is independent of the spread can be described by a given function. A more shortcoming of this distribution function is the presence of

the arbitrary constant B. A way to avoid any arbitrary parameter but to maintain the independence of the mode and spread is to use a modified version of the beta function. The existence of two different mathematical expressions for the description of different kinds of size distributions raises the question of whether they can be used interchangeably. Testing this possibility by generating data with one function and fitting them with the other distribution equation is the objective of this communication. 4 refs.

**076759 ON THE MEASUREMENT OF SMALL PARTICLE SIZE BY SEDIMENTATION.** Sedimentation of small particles through liquid has been widely utilized to measure easily the size of the particles. Concerning this, experiments were carried out both for the case of a single particle falling through liquids and for the case where particles constitute a dispersion system and fall through liquids, and the following are clarified: (1) drag coefficients measured on a single particle are approximately expressed with Stokes' law for creeping flow motion; (2) with sedimentation of dispersed particles, the falling velocity is in some cases abnormally low, though the concentration of the dispersion system used is hitherto thought to be too low to induce interaction among the suspended particles; (3) the abnormally low sedimentation speed is possibly due to the interaction among the suspended particles which are surrounded with electric double layers. **076762 INCREASED RESOLUTION OF SIZE DISTRIBUTIONS WITH THE COULTER COUNTER.** The limiting resolution of Coulter size measurements, the

size within which two separate populations can be distinguished, is discussed in relation to the standard aperture. Electronic pulse editing, by comparing pulse height to width, enables small particles to be resolved from baseline instrument noise, but can give incomplete resolution of ultra-narrow distributions from artefactually produced peaks using the standard aperture. Improvements in the minimum measurable size and in sizing resolution of narrow size ranges are also shown to be possible by improving the signal quality from the Coulter aperture. A novel mathematical approach is described for the derivation of true size spectra for narrow particle size distributions by deconvolution of the composite spectra resulting from the effect of the inhomogeneous electric field in the Coulter aperture. Simple empirical equations are used derived from the location and amplitude of the spurious peaks observed in such composites relative to the genuine peaks. (Edited author abstract). 13 Refs.

**076763 COMPARISON OF THE SIZE DISTRIBUTION OF BORON POWDERS AS MEASURED BY MALVERN DIFFRACTOMETER AND COULTER COUNTER.** Aspects of measuring the particle size distribution and median diameters of fine boron powders have been investigated. It has been demonstrated that high concentrations, typically 20 w/o, of wetting agent are necessary in a predispersion stage, especially if the material has a wide range of particle size. Measurements were made with both Coulter counting and a light scattering technique from which it has been demonstrated that for particles of median diameter in the range 10-30  $\mu\text{m}$ , the latter overizes with respect to the former by as much as 30%. (Author abstract). 5 refs.

**076764 AEROSOL GENERATION METHOD FOR MEASURING PARTICLES SUSPENDED IN WATER - DETECTION OF PARTICULATE IMPURITIES IN ULTRAPURE WATER AND SIZING OF FINE POWDERS.** The method described is based on the fact that the measurement of particles in the gaseous phase is generally easier than that in the liquid phase for fine particles smaller than 1  $\mu\text{m}$  in diameter. The system consists of a liquid nebulizing unit, evaporator, condenser, mixing diluter and two different aerosol sizing instruments. It has been found that this method can continuously detect particulate impurities in ultrapure water in situ and can measure the size distribution of fine powders in the submicron particle size range down to about 0.05  $\mu\text{m}$ . (Author abstract). 4 refs.

**076765 PARTICLE SIZE ANALYZER ACTS AS A PROCESS CONTROL TOOL IN ALUMINA INDUSTRY.** Over the years, analysts at Kaiser Aluminum in Gramercy, La., have tested and used several methods of particle size analysis in an attempt to find a way to monitor product at all stages of production and to control processes and maintain the product within specifications. Though no method has proved ideal, a recently introduced analyzer, the Lab-Tec 100, has allowed Kaiser's analysts to perform some procedures that other methods are incapable of performing. The instrument employs a laser diode that sends a scanning beam across suspended particles from outside the carrier solution. Because there is no contact, the instrument analyzes the sample without sample preparation.

## Applications

**076768 ANALYSIS OF THE INORGANIC CONSTITUENTS OF PARTICLES ON A PARTICLE-BY-PARTICLE BASIS USING A COMPUTERIZED SEM-EDS SYSTEM.** This paper is based on the development of the Moza-Austin technique for characterizing thousands of coal particles by approximate analysis of the major inorganic constituents Ca, Al, Si, K, Na, Fe and S in each particle. The technique has sufficient sensitivity to work on small volumes, is fast enough to handle large number of particles within a reasonable period of time, and consists of scanning electron microscopy combined with energy dispersive x-ray spectrometry (SEM-EDS). A computerized SEM-EDS system that allows the automated analysis of hundreds of particles per hour is described. (Edited author abstract). 19 Refs.

Gomez, Cesar O. (McGill Univ, Montreal, Que, Can); Austin, Leonard G. *Part Charact* v 5 n 2 Jun 1988 p 77-84.

## Automatic Testing

**076769 AUTOMATION OF PARTICLE ANALYSIS.** The degree of agglomeration can often be determined by comparing the average particle size identified from a surface-area measurement with that found by sedimentation, light scattering, or electrical zone sensing. A wide range of instruments is available for measuring such properties. These instruments, are being upgraded with automatic sample-handling capabilities; most now incorporate computer control for automatic operation and data analysis.

## Calculations

**076770 MODIFIED BACK-CALCULATION METHOD TO PREDICT PARTICLE SIZE DISTRIBUTIONS FOR BATCH GRINDING IN A BALL MILL.** This paper describes a back-calculation procedure based on the quasi-Newton method of optimization. The general solution of the integro-differential equation was undertaken, and with a careful study of the literature, various forms of breakage distribution function and selection function were assumed. An error function was defined as the root mean square error between the calculated and the experimental product size distributions. The values of the parameters at the lowest error were calculated, using the quasi-Newton optimization technique. This method was experimentally verified for different materials and for grinding processes following different forms of selection and breakage functions. The

calculated size distribution compared well with the experimental size distribution. (Edited author abstract) 14 refs.

**076771 MODELING OF MULTIPLE SCATTERING EFFECTS IN FRAUNHOFER DIFFRACTION PARTICLE SIZE ANALYSIS.** A model for the direct problem of calculating the forward scattering signature of a multiple scattering medium is presented. The analysis is valid for media where the particle sizes and interparticle spacings are large (relative to the wavelength and the particle size, respectively) such that Fraunhofer diffraction theory adequately describes the properties of the forward scattered light from individual scattering events. The simulated performance of laser diffraction particle sizing instruments was then studied using predictions of the scattered light signatures which would be measured by laser diffraction instrument under multiple scattering conditions. The results were compared with experimental data and theoretical calculations based on other models. (Edited author abstract). 18 Refs.

**076774 SOFTWARE PACKAGE FOR MEASUREMENT OF PARTICLE SIZE DISTRIBUTIONS.** A computer software package Sizeanal capable of running on IBM compatible personal computers, is described. It resolves the 'apparent' differences in the measurements of different particle size distribution instruments. It can serve as an effective quality control tool in many industries, such as cement, minerals, ceramics, polymers etc. It is especially useful with the 'raw data' of sieving where the measurements upto only 45 or 53 microns sieve sizes can be used to obtain the 'complete' size distribution down to 1 micron. A set of experimental data is used to demonstrate the validity and usefulness of Sizeanal. (Edited author abstract) 8 refs.

**Computer Simulation** See Also POWDER METALLURGY—Sintering.

**076775 SIMULATION OF THE SIZE DISTRIBUTION CHANGE OF MULTI-COMPONENT AERO-**

**SOL PARTICLES.** Computer simulations are performed for the size distribution change of multi-component aerosol particles. We reformulated a sectionalization model, using particle radius as an independent variable for spatially homogeneous spherical aerosol system. Included terms are coagulation, condensation, particle sources and removal. Calculated examples are shown for the size distribution change of three-component aerosols by coagulation, gravitational settling and source. Simulations were also made on the dynamics of sulfuric acid aerosol formation by photochemical reaction in a smog chamber for both cases with and without pre-existing particles, and the results show good qualitative agreement with experimental data in the particle size range larger than  $0.01 \mu\text{m}$  in diameter. **076777 ELECTRO-OPTIC SUB-MICRON SIZE DISTRIBUTION MEASUREMENT.** An apparatus is described for rapid particle size analysis. It is based upon the phenomenon of electric birefringence induced under the influence of pulsed electric fields. A major use of the system is the analysis of polydisperse colloidal suspensions where, for monomodal distributions, a complete plot of the size distribution of the particles is generated. The method can produce data in terms of equivalent spherical diameters. A novel feature, however, is that if the particle shape is known, then the distribution can be expressed directly in terms of a true major dimension. The measuring procedure is very fast. (Author abstract) 11 refs.

Jennings, B.R. (Univ of Reading, Engl); Waterman, D.R. *Filtr Sep* v 25 n 3 May-Jun 1988 p 183-185.

**076778 TOTAL PARTICLE MONITORING AND DETECTION.** One of the methods of detecting particles in the ultrafine size range (diameter  $<0.05 \mu\text{m}$ ) is by condensation nuclei counters. Such counters have a broad range of application including clean room monitoring, the characterization of contaminants in fossil energy process streams, and atmospheric monitoring. Based on the condensation of a saturated vapor, the method can amplify the size of the particles being studied by several orders of magnitude so that they can be detected by standard optical methods. However, the lower size limit of detectability is dependent on the proper choice of parameters that create the saturation conditions. This paper presents results of the counting sensitivity tests of two condensation-type counters (the Pollak and the Sinclair continuous flow counters). The results indicate that these instruments should be operated close to the self-nucleation limit in order to ensure total particle counting. (Author abstract) 35 Refs.

**076779 USE OF CALIBRATION TECHNIQUES FOR THE DEVELOPMENT AND APPLICATION OF OPTICAL PARTICLE SIZING INSTRUMENTS.** This paper describes seven different methods of calibrat-

ing optical particle sizing instruments based on single particle scattering theory. The results presented were obtained from a Laser Doppler Anemometer (LDA) using two concentric probe volumes of different diameters and colors. Measurements of the Doppler signal frequency, amplitude and visibility can yield the absolute particle size and velocity of individual particles providing that the optics and processor are correctly designed and implemented. The requirements for signal processing without validation bias are discussed together with the use of a Doppler signal generator for testing the processor. Calibration of the system is then described using a scanning pinhole unit, calibration plate and aerosols of bronze spheres. The other techniques described are the use of glass spheres mounted on thin stalks, Berglund-Lui monodisperse particle generator and latex spheres entrained in a recirculating cell. The discussion indicates the sizing range over which the above techniques are applicable. This covers a total size range from 1 micron to 1 millimeter. (Author abstract) 24 refs.

**076780 PHASE-DOPPLER-DIFFERENCE METHOD, A NEW-LASER-DOPPLER TECHNIQUE FOR SIMULTANEOUS SIZE AND VELOCITY MEASUREMENTS.** Simultaneous size and velocity measurements can be obtained by using photodetector positions of different off-axis-angles. But not for all of these positions one receives unambiguous results for the correlation between the phase difference and the particle diameter. This can be clearly demonstrated by the plots of the numerical calculations of the complete Mie's scattering equations. On the other hand for transparent particles which are less dense compared with the continuous phase and for totally absorbing materials these plots confirm the simplified equations for reckoning the particle diameter by the laws of geometrical optics. (Edited author abstract) 6 Refs.

**076781 RAPID METHOD FOR DETERMINATION OF CHANGES IN SHAPE OF COMMUNUTED PARTICLES USING A LASER DIFFRACTOMETER.** The size distributions of carefully screened  $\sqrt{2}$  size fractions of ground materials were determined using a Microtrac laser diffractometer. The size distributions were fitted to the empirical function  $P(x) = 1/[1 + (x_{50}/x)^\gamma]$  where  $P(x)$  is cumulative mass fraction less than Microtrac size,  $x$ . The standard deviation of  $\gamma$  for a 50 second test time was approximately 0.5, so that seventeen test times give a mean with an estimated error within  $\pm 0.25$  (95 percent confidence level). Values of  $\gamma$  were 5.44, 4.82, 4.40 for a coal ground under different conditions, indicating statistically different shape distributions; the average value for mica was 2.91 owing to the high aspect ratio of the particles. The ratio of  $X_{50}$  to the geometric mean sieve size was 1.2 for the coal and 0.70 for mica. (Author abstract) 6 Refs.

**Mathematical Models** See Also COKE—Crushing and Grinding; POLYMERIZATION.

**076783 TANDEM DIFFERENTIAL MOBILITY ANALYZER.** An analytic expression for the response of a TDMA system is presented and its validity discussed. A least-squares minimization technique is used with this analytic result to extract inter-DMA size changes from experimental data. A FORTRAN computer code that demonstrates the method is included as an appendix. Using this method and available instrumentation, diameter changes can be measured with a precision of about 0.3%. For aerosols in the 0.01-0.2  $\mu\text{m}$  diameter range where the technique works best, this corresponds to a precision in measuring diameter of 0.03-0.6 nm, or the characteristic thickness of a molecular monolayer. Guidelines for laboratory implementation of the TDMA are suggested and specific examples discussed. A more accurate numerical solution is used to estimate the systematic error introduced by the approximate, analytic expression. (Edited author abstract) 23 refs.

**076784 COMPARISON OF PARAMETER ESTIMATION PROCEDURES FOR EXPERIMENTAL BIMODAL LOGNORMAL PARTICLE SIZE DISTRIBUTIONS AND GROUPED DATA.** Four estimation methods are compared with regard to the estimated parameters and the resulting estimated moments, when applied to bimodal lognormal particle size distributions. The method of maximum likelihood, of minimum Chi-square and of minimum distance were applied to artificial samples from numerically simulated populations, representative of many aerosol populations found in practice as well as a method derived by the authors, which is based on the binomial distribution of grouped data in diameter intervals. The results of the comparison of estimated and 'true' parameters are evaluated in terms of percentage inaccuracies. The expected percentage inaccuracies of the estimated moments calculated from the estimated parameters are quantified for various physically relevant orders. It is concluded that the maximum likelihood method tends to be preferable to the others. (Author abstract) 18 refs.

**076785 PERSISTENCE OF POLYGONAL HARMONICS AS SHAPE DESCRIPTORS.** Characterization of the overall (large scale) shape of rugged particles poses a problem which is not readily solved by existing shape analysis techniques. Recent research on the divider stepping method used in factual analysis has led to the examination of polygonal harmonics which can be constructed in both smooth and rugged particle silhouettes. The persistence of these harmonics is defined as the ratio of the longest step length to shortest step length which can be used to create that harmonic. It is proposed that the persistences of the first three harmonics provide useful descriptors for particle shape. Variation of these persistences within several geometric figures is explored, protocols for the analysis are adopted and some preliminary work on rugged silhouettes is discussed. (Edited author abstract) 16 refs.

**076787 EVOLUTION OF THE DIMENSIONAL SPECTRUM AND THE CONDENSATIONAL STABILITY OF PARTICLES IN A FIELD OF TURBULENT-FLOW-TEMPERATURE PULSATIONS.** The evolution of the dimensional spectrum of condensed particles (CP) in a turbulent gas flow is examined with allowance for vapor depletion. We also examine the effect of temperature fluctuations on the condensational stability of the CP's. It is shown that growth of the particle system, including for  $T_0 = \text{const}$ , is accompanied by broadening of the dimensional spectrum at the initial stage of growth (due to turbulent pulsations) and by contraction of the spectrum during the final growth stage (due to vapor depletion). Investigation of the stability of a particle system against condensation-evaporation processes taking place in temperature fluctuation ranges showed that particles will evaporate on the average, even at  $S_0 = 1$  ( $S_0$  is saturation, calculated for the mean temperature). (Edited author abstract) 10 refs.

## Measurements

**076789 COINCIDENCES EN GRANULOMETRIE PAR SONDE A VARIATION DE RESISTANCE.** [Coincidences in Granulometry Using the Resistance Variation Probe]. The coincidences in granulometry induce two closely related errors: a counting error and a classing one. The counting correction for uniform particles hematology can be extended to any granulometric distribution. Furthermore, it allows the separation of the two kinds of error. The correction of the classing error thus isolated can be made by deconvolution. (Edited author abstract) 10 refs. In French.

Besancon, P. (UFR Medicine-Pharmacie de Rouen, St. Etienne du Rouvray, Fr); Chastang, J.; Frigot, P.; Lafaye, A. *Powder Technol* v 52 n 3 Oct 1987 p 219-226.

**076790 PARTICLE SIZE ANALYSIS VIA MERCURY INTRUSION MEASUREMENTS.** In this work, we use the known shape of the breakthrough curve for a close random packing of monodisperse spheres to correct (in part) for the errors of intrusion particle sizing. To extract the desired size information, the solution of a Fredholm integral equation must be obtained. The solution is obtained using the method of regularization in conjunction with a technique for finding the optimum smoothing value. For monodisperse powders, the calculated mean size and size distribution are in excellent agreement with TEM measurements. For bidisperse mixtures, both peaks can only be identified in the limit of large number fraction and large size ratio between the two sizes. (Edited author abstract) 16 refs.

Smith, D.M. (Univ of New Mexico, Albuquerque, NM, USA); Sterner, D.L. *Powder Technol* v 53 n 1 Nov 1987 p 23-30.

**076791 PARTICLES IN FLOW.** Vast improvements in optics, electronics, stain utilization, and immunofluo-

rescence result in the ability to analyze particles and cells of a natural population by flow cytometers/cell sorters within minutes. Flow cytometers/cell sorters have provided biological and optical oceanographers with an opportunity for new flexibility and experimentation. This is characterized by rapid measurement of two to six parameters made simultaneously on large numbers of individual particles. Knowledge of variability can advance our information base. Information compression as well as information expansion relating size/light scatter and fluorescence parameters are presented. (Edited author abstract) 33 refs.

**076792 VISIBLE INFRA-RED DOUBLE EXTINCTION MEASUREMENTS IN DENSELY LADEN MEDIA, NEW PROGRESS.** This paper describes new progress obtained with an optical technique called V.I.D.E. (Visible Infra-red Double Extinction) which simultaneously measures mean particle size in the range of 10-120  $\mu\text{m}$  and mean number density in densely laden media (up to 0.1 percent volume fraction). The underlying theory, taking account of multiple light scattering, is recalled. Simultaneous size and concentration measurements are obtained by simultaneously recording transmittances of the medium at two well chosen wavelengths. Experimental results for suspensions of glass particles in air, are described and discussed. (Edited author abstract). 19 Refs.

**076793 DETERMINATION OF PARTICLE SIZE DISTRIBUTION IN FLUIDS USING PHOTON CORRELATION SPECTROSCOPY.** Photon correlation spectroscopy (PCS) has been applied to various systems of particles suspended in a fluid. Computer simulations were used to analyse CONTIN, a program for the numerical inversion of the experimental data. Measurements were performed on a spectrometer equipped with a digital correlator. Various suspensions of polystyrene latex spheres differing both in size and size distribution were prepared in double distilled water. Further, some samples provided by an external institution without prior specification were analysed. Diffusivity measurements on submicron DES (di-2-ethylhexyl sebacate) particles in nitrogen were also performed. The results obtained demonstrate the strengths and the limitations of PCS as a method of determining particle size distributions in particle fluid systems. (Author abstract). 11 Refs.

**076794 SIZE SEPARATION OF PARTICLES FROM AEROSOL SAMPLES USING IMPACTORS AND CYCLONES.** Investigations are presented on particle separation in impactors, sampling cyclones and other precollectors. These devices are increasingly used for the characterization of particulate matter. Size selective samplers must be characterized by their grade efficiency curves. A new measuring procedure is presented, which permits the determination of the grade efficiency curves of various sampling devices. An optical particle counter and a vibrating orifice generator are used in these measurements. This calibration technique is fast and has a high resolution. Investigations were carried out on the influence of various parameters on the classification efficiency of impactors and sampling cyclones. Using the extensive data measured a better understanding and quantification of impactor and cyclone behaviour is developed which may improve their applications in particle sampling. (Author abstract). 6 Refs.

**076795 APPLICATION OF THE STRAINING CAPTURE MECHANISM IN GAPS TO THE MEASUREMENT OF PARTICLE CONCENTRATION AND SIZE DISTRIBUTION.** This paper attempts to answer the question of whether a measurement of the relative flow rate of a suspension of spheres, flowing under constant pressure drop through gaps of precisely determined geometry, may be utilised to measure the concentration and size distribution of the particles. A positive answer is possible only if several restrictions are imposed on the character of the flow, a maximum ratio of sphere diameter to gap height and a maximum number of captured particles. This answer is based on a model of the filtration process taking place in the gap and the consequent relationship between the flow characteristics of the gap and the number and diameter of the captured particles. (Author abstract). 6 Refs.

## Performance

**076798 IMPROVEMENTS ON THE OPTICAL FIBER PARTICLE SIZER.** The following improvements were made on an optical fiber droplet sizer (previously developed by the author) that is used to measure the particle size and number density: (1) An accurate equation of the light intensity received on an optical fiber was derived while considering the scattering angle range of the light received on the optical fiber and the attenuation of the irradiation beam. (2) The particle size distribution, expressed as the particle number in units of volume, was obtained by solving the above accurate equation. As a result of measurements of polystyrene particles with known size distributions and known number densities, it was confirmed that the accuracy of measurements was improved so that the error of the average diameter  $D$  was less than 0.1  $\mu\text{m}$  ( $0.1 \mu\text{m} \leq D \leq 1.0 \mu\text{m}$ ) and the error of the number density was less than 100% ( $0.3 \mu\text{m} \leq D \leq 1.0 \mu\text{m}$ ). These measurements are used for estimating losses in efficiency and the erosions of turbine blades. (Edited author abstract) 9 refs.

## Peoples Republic of China

**076800 ABC OF FILING AN APPLICATION FOR PATENT IN CHINA.** This paper describes the kinds of Chinese patents, requirements for grant of patent right, the documents submitted, principle of application, priority right, the patent agency, filing procedures and compulsory license for exploitation of the patent. In accordance with Article 2 of the Chinese Patent Law there are three types of patent rights, namely, inventions, utility models and designs. Under the Chinese Patent Law, an invention or utility model for which patent rights may be granted must possess novelty, inventiveness and practical applicability. The documents of application include a request, a description and an abstract and claims. Any document submitted must be written in Chinese. (Edited author abstract) In Chinese.

**076801 EFFICIENT BIT-LEVEL SYSTOLIC ARRAY FOR THE LINEAR DISCRIMINANT FUNCTION CLASSIFIER.** The linear discriminant function

classifier is a widely used but computationally demanding method in statistical pattern recognition. This paper describes a bit-level systolic array for the linear discriminant function classifier to improve its processing speed. The system includes a new scheme for inner product computation, which not only has 100% efficiency but also gains a speed improvement over a previous method, and yields classification results at an average rate of one per B cycles of the array, where B is the wordlength of the input data. The throughput is higher than those of the related bit level arrays described previously. (Author abstract) 16 refs.

Wang, C.-L. (Nat'l Chiao Tung Univ, Hsin-Chu, Taiwan); Wei, C.-H.; Chen, S.-H. *IEE Proc Part G* v 134 n 5 Oct 1987 p 216-224.

**076802 OBJECT DETECTION AND EXPERIMENTAL DESIGNS.** A new object detection classifier is developed by combining the supervised learning model, hypothesis testing techniques, and the robust F-statistic in conjunction with the analysis of variance (ANOVA) process. The visual equivalence of two similarly dimensioned images is interpreted in terms of the F-statistic of two standard patterns resulting from transformations by a set of randomly generated rules. The object registration is related to the target and background portions of the reference template. Using the F-statistic as the test statistic, the object detection procedure is reduced to a simple ANOVA process. The multiple-hits problem is also resolved using either the distance between the test statistic and the threshold values or a set of floating threshold values associated with various confidence levels. (Edited author abstract) 17 refs.

**076803 AVOIDING PEAKING PHENOMENON OF THE QUADRATIC DISCRIMINANT FUNCTION.** The performance of the discriminant function is degraded if the parameters used contain estimation errors. A peaking phenomenon is known in which the classification rate reaches the maximum for a certain feature dimension, but decreases with the further increase of the feature dimension. This paper reports the result of experimental examination of the relations of the classification rates of the Euclid distance, the quadratic discriminant function to the feature dimension. It is shown that the modified quadratic discriminant function corresponds to the discriminant function where the maximum-likelihood estimation for the covariance matrix of the quadratic discriminant function is replaced by a kind of pseudo-Bayes estimation, and suppresses the peaking phenomenon. (Author abstract) 9 refs.

**076804 OPTICAL INSPECTION/PATTERN RECOGNITION.** Automated optical inspection (AOI), as applied to electronic products, is considered. The optical inspection station is made an integral part of the manufacturing process. This involves taking information downloaded from CAD databases and feeding test results and fault locations to a growing assortment of verification, repair and central processing utilities. The electronics industry's portion of vision technology now is predicted to eclipse that of the automobile manufacturers before the end of the decade, making it the top consumer of optical inspection systems.

**076805 ON THE BIT COMPLEXITY OF DISTRIBUTED COMPUTATIONS IN A RING WITH A LEADER.** We study the bit complexity of pattern recognition in a distributed ring with a leader. Each processor gets as input a letter from some alphabet, and these concatenated letters, starting at the leader, form the pattern of the ring. The leader initiates an algorithm that

accepts or rejects this pattern. Thus each algorithm recognizes a language over a given alphabet. Several results concerning the language are proved. (Edited author abstract) 15 refs.

**076807 PATTERN MATCHING USING FINITE STATE MACHINES.** The problem of pattern matching is considered. It can be a simple problem solved with a trivial string comparison utility, or it can be so complex as to require the use of a lexical analyzer. This article describes how state machines can be useful in solving this type of problem. To demonstrate the use and effectiveness of state machines, this article provides the source code for a program called findcmd. The program does just what the name implies—it finds commands. When invoked, the program searches each component of the user's path variable for all programs (files) that match the supplied pattern arguments. The pattern string can contain wildcard characters just like those the DOS command shell accepts. The program uses an extension of the Knuth-Morris-Pratt (KMP) algorithm, which implements pattern matching using a finite state machine. 4 refs.

**076808 STUDIES IN POSSIBILISTIC RECOGNITION.** This paper introduces an algorithm for pattern recognition. The algorithm will classify a measured object as belonging to one of N known classes or none of the classes, making use of fuzzy techniques and possibility instead of probability. It was conceived with the idea of recognizing fast moving objects, but it is shown to be more general. Fuzzy ISODATA is used as a front end to the algorithm. The algorithm is shown to accomplish the objectives of correct classification or no classification. Values that describe possibility distributions are introduced and some of their properties investigated and illustrated. An expected value for a possibility distribution is also investigated. The algorithm actually proves to be adaptable to a wide variety of imprecise recognition problems. Some test results illustrate the use of the technique embodied in the algorithm and indicate its viability. (Edited author abstract) 40 refs.

**076809 GENERALIZED k-NEAREST NEIGHBOR RULES.** This paper discusses a suitable framework for generalizing the k-nearest neighbor (k-NNR) algorithms to cases where the design labels are not necessarily crisp, i.e., not binary-valued. The proposed framework imbeds all crisp k-NNR's into a larger structure of fuzzy k-NNR's. The resultant model enables neighborhood voting to be a continuous function of local labels at a point to be classified. We emphasize that the decision itself may be crisp even when a fuzzy k-NNR is utilized. The usefulness of this extension of the conventional technique is illustrated by comparing the observed error rates of four classifiers (the hard k-NNR, two fuzzy k-NNR's, and a fuzzy 1-nearest prototype rule (1-NPR)) on three data sets. (Edited author abstract) 15 refs.

**076816 ASTIGMATIC HOLOGRAPHIC PROCESSOR FOR LOCAL PATTERN RECOGNITION.** A coherent processor for local correlation is described. This device can be used to unmask local resemblances between object transparencies and a stored matched filter, which

would be hidden in global correlation, as that of a classical Vander Lugt filter. This is achieved by means of a holographic filter that is an image hologram in one direction and a lensless Fourier transform hologram in the other. The hologram is registered with a line reference beam in the conjugate plane of a cylindrical lens and is reconstructed by means of a spherocylindrical optical system. (Author abstract) 6 refs.

Rabal, H.J. (Centro de Investigaciones Opticas, La Plata, Argent); Furlan, W.D.; Garavaglia, M. *Opt Commun* v 65 n 5 Mar 1 1988 p 343-346.

**076817 ALGORITHM FOR VERTEX DETECTION.** Optical pattern recognition is playing an ever increasing role in the automation of manufacturing processes. A PC-based vision system was used to acquire the 2D image of flat parts (of polygonal geometry). The edges of this image were identified using a boundary encoding technique. Valid intersections of the edges were defined by using a bounding box, to decipher the co-ordinates of the vertices. Thus the identification of the object was done totally in software. (Edited author abstract) 16 refs.

Anand, S. (Pennsylvania State Univ, University Park, PA, USA); Raman, S.; Wysk, R.A. *Comput Ind Eng* v 14 n 2 1988 p 77-83.

**076818 NEURAL NETWORK MODEL BASED ON SHORT-TERM MEMORIES FOR THE HIERARCHICAL RECOGNITION OF TEMPORAL PATTERNS.** A new self-organizing neural network model is proposed and evaluated for the mechanism of temporal pattern recognition of the auditory system. The model is constructed based on the hypothesis that total recognition of temporal patterns approximately of the length of words, is carried out by hierarchical identification and integration of the temporal relations of the constituent features. The model has a hierarchical structure in which short-term memories storing spatial patterns, the circuits extracting temporally transient components of the pattern and the feature detection circuits to identify spatial patterns are iteratively cascaded. After the circuit is self-organized by repetitive presentation of training patterns, the model can correctly identify the training patterns and their temporally compressed and stretched patterns. It is also indicated that the short-term memory function at each layer of the model is essential to the acceptance of temporally deformed patterns. Studies to expand the model to top-down processing are also discussed. (Author abstract) 3 refs.

Futami, Ryoko (Hokkaido Univ, Sapporo, Jpn); Hoshimiya, Nozomu. *Syst Comput Jpn* v 19 n 2 Feb 1988 p 102-109.

**076819 COMPUTER VISION SYSTEM BY MODEL REPRESENTATION INVOLVING AMBIGUOUS CONCEPTS.** The authors consider planar-faced or curved-surface solid bodies having trihedral vertices only. They discuss a model representation and an inference mechanism which can accumulate ambiguous concepts directly and performs recognition of hand drawn figures efficiently with the level of conformity with the input image as a clue. They explain the matching process of models and input figures. Finally, they demonstrate how the whole system works via an actual example of the recognition. 7 refs.

**076820 FIGURE RECOGNITION METHOD FOR HAND-WRITTEN DRAWINGS.** A method is proposed to recognize symbols and lines in handwritten plant record drawings of poor quality. This method is composed of symbol candidate detection, symbol discrimination and line segment recognition processes. The symbol candidate detection process extracts symbols of different sizes simultaneously at high speed. The symbol discrimination process classifies the candidates into several plant symbols by interior pattern structure analysis based on distance transformation, thinning and so on. Experiment results

show that the correct recognition rate of symbols and lines is more than 90%. (Author abstract) 10 refs. In Japanese.

**076821 IMAGE-RECOGNITION SYSTEM USING ALGORITHMICALLY DEDICATED INTEGRATED CIRCUITS.** An image-recognition system was implemented with a set of eight algorithmically dedicated integrated circuits to recognize two-dimensional objects that are characterized by their closed outer contours. The complete system operates at rates up to 15 frames/second using a standard workstation as a controller. The recognition system achieved a 97% recognition rate for over 10,000 trials of recognition of eight objects over a wide range of orientation and size variations. A 100% recognition rate was achieved if size variations were eliminated. The set of 4-micron NMOS image processor chips operates on 10-megahertz 8-bit video data (512x512 images) in real time. The relationship between the algorithms that were implemented and the silicon implementation is discussed. (Edited author abstract) 19 refs.

Ruetz, Peter A. (Univ of California at Berkeley, Berkeley, CA, USA); Brodersen, Robert W. *Mach Vision Appl* v 1 n 1 1988 p 3-22.

**076822 PATTERN RECOGNITION BY LABELED GRAPH MATCHING.** A model for position invariant pattern recognition is presented. Although not demonstrated here, the system is insensitive to distortions. Recognition is based on labeled graph matching. The system consists of two layers of neurons, an input layer, and a memory and recognition layer. The latter consists of subnets to represent individual patterns. In both layers, patterns are represented by labeled graphs. Nodes are 'neurons,' labels are local feature types, links are implemented by excitatory connections and represent topology. Recognition is driven by spontaneous dynamic activations of local clusters in the input layer. Network dynamics is able to selectively activate with good reliability corresponding clusters in memory layer. Few cluster activations suffice to identify the subnet and pattern corresponding to the graph in the input layer. The system has been implemented and tested with the help of simulations. (Author abstract) 32 refs.

von der Malsburg, Christoph (Max-Planck-Inst fuer Biophysikalische Chemie). *Neural Networks* v 1 n 2 1988 p 141-148.

**076823 CONTOUR DETECTION ALGORITHM BASED ON THE MINIMUM RADIAL INERTIA (MRI) CRITERION.** A new method for contour detection of objects in images is presented. It works simultaneously on all the pixels of real images, in which the object of interest has a radially connect contour. As a consequence, the contour can be described as a linear combination of period basic (cubic) splines in polar coordinates. To this aim, the 'radial inertia' defined versus generic radially connected curve, is introduced as a functional over the 'significant' pixels the image. The minimization of this functional supplies the required contour. If necessary some iterations of the method allow the distortion effects due to extraneous structures and noise to be reduced. Several examples show the capabilities of the proposed method practical cases. (Author abstract) 26 refs.

Grattoni, Paolo (CNR, Turin, Italy); Pollastri, Fabrizio; Premoli, Amedeo. *Comput Vision Graphics Image Process* v 43 n 1 Jul 1988 p 22-36.

**076824 ESTIMATION OF RIGID BODY MOTION USING STRAIGHT LINE CORRESPONDENCES.** An algorithm for the estimation of rigid body motion using straight line correspondences is presented in this paper. In the case of pure translation, we present a linear algorithm using 5 line correspondences over 3 frames. In the case of general motion, it is found that the rotation and the translation parts are separable. The rotation part can

be computed by the iterative solution of nonlinear equations based on 6 or more line correspondences over 3 frames. After the rotation is found, the translation part is determined just as in the pure translation case. For the special case of constant rotation, the convergence range of the iterative method is wide enough so that global search can be used to estimate the rotation matrix. However, for the case of variable rotation, global search appears computationally infeasible at present. (Author abstract) 12 refs.

Liu, Yuncai (Univ of Illinois at Urbana-Champaign, Urbana, IL, USA); Huang, Thomas S. *Comput Vision Graphics Image Process* v 43 n 1 Jul 1988 p 37-52.

**076825 FROM AN IMAGE SEQUENCE TO A RECOGNIZED POLYHEDRAL OBJECT.** The paper describes the combination of several novel algorithms into a system that obtains visual motion from a sequence of images and uses it to recover the three-dimensional (3D) geometry and 3D motion of polyhedral objects relative to the sensor. The system goes on to use the recovered geometry to recognize the object from a database, a stage which also resolves the depth/speed scaling ambiguity, resulting in absolute depth and motion recovery. The performance of the system is demonstrated on imagery from a well carpentered constructive solid geometry (CSG) model and on real imagery from a simple wooden model. (Author abstract) 40 refs.

**076827 PICTURE SYNTHESIS: AN ESSENTIAL TOOL FOR NUMERICAL EXPERIMENTATION.** Science and Technique translate into mathematical language the behaviour and the shape of the objects that they study and produce; these expressions are named models. The corresponding equations must be solved analytically or numerically (according to the possibilities) in order to validate the assumptions and to make predictions. Most of the time, by means of faster and faster computers, these calculations give birth to very large amount of numerical results. The use of supercomputers submerges scientists and engineers with avalanches of numbers. This paper describes the use of the picture synthesis as the best way to output results from numerical simulations.

**076828 MODEL-BASED RECOGNITION OF GLOSSY OBJECTS USING THEIR POLARIMETRIC PROPERTIES.** A model-based approach to recognition of glossy objects is presented. Normals of surface patches are obtained by analyzing the polarizational state of the observed rays under illumination of light sources of circular polarization. The object is assumed to lie alone in its stable pose on the floor. Solid models are examined to find the one that matches the observed normals. First, a candidate model based on the relative angles between known surface normals is found. Then the translation so that the observed positions of surface normals coincide with those of models in the image is found. Some examples are also presented. (Author abstract). 4 Refs.

**076829 SEPARATING FORCE OF FEATURES IN PROBLEMS OF RECOGNITION LEARNING BASED ON THE METHOD OF LIMITING SIMPLIFICATIONS.** A notion of the separating force of a feature in pattern recognition learning is introduced and formalized. The procedure of learning by the method of limiting simplifications is organized with due regard for the separating force of a sign. The learning algorithm 'PUMA' is presented and the results of the concrete problem solution are discussed. (Author abstract). 4 Refs.

**076830 GENERALISED THRESHOLD SELECTION FOR EDGE DETECTION.** This paper derives a generalised technique for selecting thresholds of edge strength maps from theoretical considerations of the known noise statistics of the image. A technique is described for estimating the mean and variance of the noise of an image using a pair of images. The threshold selection technique can be applied to any single digital edge operator and has been extended for use with combinations of edge operators. Two examples of thresholded edge maps using the techniques developed here are shown. (Author abstract). 5 Refs.

**076831 ON THE MINIMUM NUMBER OF TEMPLATES REQUIRED FOR SHIFT, ROTATION AND SIZE INVARIANT PATTERN RECOGNITION.** Human observers are generally capable of recognizing patterns invariant to their orientation, position and size within an image. Though techniques are available for similar performance in computer visual systems, most suffer from lack of uniqueness or computational complexity. In this paper we introduce a new adaptive approach to invariant pattern recognition which overcomes both these problems. This technique is based upon the intrinsic invariance properties of the pattern and the recognition criterion. Our simulations demonstrate that the number of templates required to gain efficient pattern recognition is considerably lower than previously thought. (Author abstract). 20 Refs.

**076832 EXTRACTION OF TREND LINES AND EXTREMA FROM MULTISCALE CURVES.** Multiscale planar curves are curves conveying information at several levels of detail. To extract polygonal approximations of such curves at different resolutions, we propose a parallel method based on connecting locally computed centroids. The implementation makes use of a new pyramidal data structure, the chain pyramid. Coarser and coarser approximations are obtained through a hierarchy of increasingly coarse tessellations. Significant extrema of the curves are localized at the highest resolution by segmenting at a 'natural scale' and employing the structure of the chain pyramid for down-projection. (Author abstract). 12 Refs.

Meer, Peter (Univ of Maryland, College Park, MD, USA); Baugher, Ernest S.; Rosenfeld, Aziel. *Pattern Recognit* v 21 n 3 1988 p 217-226.

**076833 INVARIANT PLANAR SHAPE RECOGNITION USING DYNAMIC ALIGNMENT.** Closed planar shapes are modelled by an ordered sequence that represents the Euclidean distance between the centroid and all contour pixels of the shape. Shapes belonging to the same class have similar sequences, hence a procedure for classifying shapes is based on the degree of similarity between these sequences. In order to determine the similarity between sequences, a dynamic alignment process is developed to find the best correspondence between the sequences. Optimum alignment is obtained by expanding segments of the sequences to minimize a dissimilarity

function between the sequences. Normalization with respect to scaling and rotation is described and an example illustrating the use of dynamic alignment for the classification of noisy shapes is presented. (Author abstract). 5 Refs.

**076834 CONSENSUS-BASED PARTITIONS IN THE SPACE OF ORDERED PARTITIONS.** The paper presents a method of determining a representation of ordered partitions, i.e. a partition to which the sum of distance from fixed partitions is minimal. Two metrics are proposed as measures of distance between ordered partitions. The first metric is equal to the minimum number of element moves necessary to transform a partition into another one, and the second one equals the sum of weights of these element moves. Criteria of selecting best representations of chosen ordered partitions are also presented. (Author abstract). 8 Refs.

**076835 NEIGHBORHOOD METHOD IN RECOGNITION PROBLEMS.** A new recognition method based on the precedence principle is proposed. In this method, estimation of the nearest neighbors of the recognized object in the training set does not require comparisons with all the elements of the training set and does not presuppose subdivision of classes by means of given hypersurfaces. A new machinery connected with classical mappings of the type of Peano curves is utilized. An example of application of this method for screening diagnostics is given. (Author abstract). 12 Refs.

**076836 MAXIMUM  $\Sigma$ -COUNT AS A DECISION OPERATOR.** The main approaches in pattern classification can be grouped into two main categories: the statistical and the syntactic pattern classification. This paper presents another method based on fuzzy set theory. At first a brief overview of the statistical method is given and especially the maximum likelihood decision rule. Then the maximum  $\Sigma$ -count operator is introduced which in contrast to the maximum likelihood decision rule is based not on 'a priori' probabilities but on fuzzy labels. An algorithm that operates on a parallel fuzzy labeling file is presented along with a real implementation of the maximum  $\Sigma$ -count operator. The advantages and the versatility of this approach against the statistical one are emphasized and final conclusions are drawn. (Author abstract). 9 Refs.

**076837 CLASSIFICATION OF PATTERNS USING A SELF-ORGANIZING NEURAL NETWORK.** The objective of this study is to evaluate the performance of K. Fukushima's neocognitron model when it is applied to complex imagery. In his original report, Fukushima demonstrated that this system could discriminate between simple alphabetical characters represented in fields of 16 X 16 pixels, and that shift invariance can be achieved through a proper choice of design parameters. The present work describes results for expanded neocognitron architectures operating on complex images of 128 X 128 pixels. These neural network systems were simulated on a VAX-8600 minicomputer. Wire frame models of three different vehicles were used to test the properties which Fukushima had demonstrated. The expanded neocognitron systems were able to classify these objects and to identify their critical features. After training, each object was placed at different positions in the plane, and the neocognitron's shift invariance property was tested. With complex (128 X 128) imagery, it was difficult to achieve proper classification and maintain shift invariance using

only a few levels. In another experiment, the neocognitron trained on polar transforms of objects in the training set. Objects in the training set were rotated, and polar transforms of the rotated images were submitted as input. In this manner, the neocognitron's shift invariance was exploited to recognize rotated imagery. These investigations gave insight into the role of various model parameters and their proper values, as well as demonstrating the model's applicability to complex images. (Author abstract). 4 Refs.

**076838 INDUCTIVE INFERENCE OF PATTERN RECOGNITION RULES WHICH ARE CAPABLE OF A LINGUISTIC INTERPRETATION.** A new algorithm for the inductive inference of pattern recognition rules from a class of examples and another class of counter-examples is given. An important feature of the algorithm is that a discriminant for the class of examples is generated in a format which allows immediate interpretation into the language of the application domain expert. The approach is an extension to that of R.S. Michalski and incorporates ideas from fuzzy set theory. It is aimed at applications where the observable variables are such that the sample space of each class overlaps. The algorithm has been tested and validated on a complex data set consisting of observations on 1000 head-injured patients. A particular feature of this data set is the large proportion of missing values. This data set was also of special interest, since it has been used by others as a vehicle for comparing several statistical discrimination techniques. The proposed method for transformation to linguistic output is also demonstrated for this data set. (Edited author abstract). 30 refs.

**076840 MATHEMATICAL FORMULA FOR SUBJECTIVE EXPRESSION ON VISUAL PATTERNS.** In actual image recognition, one does not always view the whole image, but often subjectively selects a certain subregion on the image to obtain some useful information. This paper clarifies theoretically the reason why such an ability possessed by humans is naturally carried out, by using a mathematical analysis regarding the fundamental properties of a visual pattern. A mathematical formula showing multilayer structures of a visual pattern is obtained by the foregoing analysis. The results obtained in this paper may contribute to elucidating the aspect of the basic process of the feature extraction from the pattern. (Author abstract). 8 Refs.

**076841 SYNTHESIZING STATISTICAL KNOWLEDGE FROM INCOMPLETE MIXED-MODE DATA.** A method for analyzing and clustering (synthesizing) multivariate data of the mixed type (discrete and continuous) is presented that enables statistical knowledge to be acquired from such data. The method adopts an event-covering approach that covers a subset of statistically relevant outcomes in the outcome space of variable-pairs. Once the covered event patterns are acquired,

subsequent analysis tasks such as probabilistic inference, cluster analysis, and detection of event patterns for each cluster based on the incomplete probability scheme can be performed. The performance is evaluated by experiments using both simulated and real-life data. 22 refs.

**076842 CONVERGENCE THEORY FOR FUZZY C-MEANS: COUNTEREXAMPLES AND REPAIRS.** A counterexample to the original incorrect convergence theorem for the fuzzy c-means (FCM) clustering algorithms is provided. This counterexample establishes the existence of saddle points of the FCM objective function at locations other than the geometric centroid of fuzzy c-partition space. Counterexamples previously discussed by W.T. Tucker (1987) are summarized. The correct theorem is stated without proof: every FCM iterate sequence converges, at least along a subsequence, to either a local minimum or saddle point of the FCM objective function. Although Tucker's counterexamples and the corrected theory appear elsewhere, they are restated as a caution not to further propagate the original incorrect convergence statement. 12 refs.

**076843 PARTIAL SHAPE RECOGNITION USING DYNAMIC PROGRAMMING.** A partial-shape-recognition technique utilizing local features described by Fourier descriptors is introduced. A dynamic programming formulation for shape matching is developed, and a method for comparison of match quality is discussed. This technique is shown to recognize unknown contours that may be occluded or that may overlap other objects. Precise scale information is not required, and the unknown objects may appear at any orientation with respect to the camera. The segment-matching dynamic programming method is contrasted with other sequence-comparison techniques that utilize dynamic programming. Experimental results are discussed that indicate that partial contours can be recognized with reasonable accuracy. 19 refs.

**076844 CAPACITY OF MULTILEVEL THRESHOLD FUNCTIONS.** Lower and upper bounds for the capacity of multilevel threshold elements are estimated, using two essentially different enumeration techniques. It is demonstrated that the exact number of multilevel threshold functions depends strongly on the relative topology of the input set. The results correct a previously published estimate and indicate that adding threshold levels enhances the capacity more than adding variables. 11 refs.

**076845 BOUNDS ON THE BAYES CLASSIFICATION ERROR BASED ON PAIRWISE RISK FUNCTIONS.** Upper and lower bounds on the Bayes risk for multiple, composite-hypothesis classification are obtained. Bounds on the Bayes risk for M simple classes are derived in terms of the risk functions for (M-1) classes, and so on, until the desired result depends only on the pairwise (M = 2) Bayes risks. A method of computing upper and lower bounds on the pairwise Bayes risk for composite classes is developed. Algorithms for computing the upper and lower bounds for the general M-class case and for composite-hypothesis classes are presented. Numerical examples of the application of the bounding techniques to a problem involving the classification of aircraft are discussed. Results for the bounds and other performance measures are compared for the most interesting cases. 17

**076846 COMPUTERIZED SIGNATURE VERIFICATION SYSTEM.** The fine structure of the human muscle forces that are exerted during the writing of a signature is consistent and well defined for most people. On the basis of this observation, an experimental system that utilizes a person's signature waveform dynamics for identification is proposed. The system is intended to be used for online signature verification. It can successfully verify a person's identity and can also detect forgeries. The acceptance rate for random forgeries, i.e., accidental matching of two different persons' signatures, is very low. 8 refs.

**076847 AUTOMATIC PATTERN RECOGNITION: A STUDY OF THE PROBABILITY OF ERROR.** A test sequence is used to select the best rule from a class of discrimination rules defined in terms of the training sequence. The Vapnik-Chervonenkis and related inequalities are used to obtain distribution-free bounds on the difference between the probability of error of the selected rule and the probability of error of the best rule in the given class. The bounds are used to prove the consistency and asymptotic optimality for several popular classes, including linear discriminators, nearest-neighbor rules, kernel-based rules, histogram rules, binary tree classifiers, and Fourier series classifiers. In particular, the method can be used to choose the smoothing parameter in kernel-based rules, to choose k in the k-nearest neighbor rule, and to choose between parametric and nonparametric rules. 141 refs.

**076848 CLASSIFIER FOR FEATURE VECTORS WHOSE PROTOTYPES ARE A FUNCTION OF MULTIPLE CONTINUOUS PARAMETERS.** A fast, compact continuous-parameter (CP) classifier, suitable for a 16-bit microprocessor, is developed for classes which consist of a prototype manifold which is a function of one or more continuous parameters. The classification method consists of approximating the manifold by a number of unit cells and assigning a test vector to the closest cell using a Euclidean distance measure. An experiment is described in which computer-generated magnetic dipole moments are used as feature vectors to classify a set of homogeneous ferrous spheroids. The CP classifier provides accurate estimates of the orientation angles of the test object with error equal to a small fraction of the design set increment (1° out of 15°). The 1-NN (nearest-neighbor) classifier was the only other that could estimate the angles, with an error of one design set increment (15°). The classifier yields a substantially lower probability of misclassification (P(e)) for the same design set than the nearest mean vector, Fisher-pairwise, and K-NN (K > 1) classifiers, about the same P(e) as the 1-NN. A modified Parzen classifier has a substantially higher P(e) than the CP classifier for test vectors with small-to-moderate uncertainties, and substantially lower P(e) for very large uncertainties. 14 refs.

**076850 APPLICATION OF THE MULTIEDIT-CONDENSING TECHNIQUE TO THE REFERENCE SELECTION PROBLEM IN A PRINT RECOGNITION SYSTEM.** We address the elusive problem of selecting references (templates) for minimum distance classification when the number of pattern classes is very large. We argue that the multiedit/condensing technique offers an automatic solution to this problem which avoids the proliferation of references without impairing the recognition performance. The effectiveness of the approach is demonstrated by experimental results in a print recognition context. Suggestions are made about ways of circumventing problems of computational complexity. (Edited author abstract) 14 refs.

**076851 NEW FORMS OF SHAPE INVARIANTS FROM ELLIPTIC FOURIER DESCRIPTORS.** New forms of shape invariants are derived, using matrix trace operators, for pattern recognition. These invariants form a non-redundant set, have more straightforward and understandable geometric meanings, and require fewer computations. They are independent of the shape rotation and translation. These invariants are interpreted geometrically and compared to those defined by Granlund. Possible utilizations for pattern recognition are discussed. (Author abstract) 15 refs.

**076852 BOOTSTRAP TECHNIQUE IN CLUSTER ANALYSIS.** We define a method to estimate the number of clusters in a data set E, using the bootstrap technique. This approach involves the generation of several 'flake' data sets by sampling patterns with replacement in E (bootstrapping). For each number, K, of clusters, a measure of stability of the K-cluster partitions over the bootstrap samples is used to characterize the significance of the K-cluster partition for the original data set. The value of K which provides the most stable partitions is the estimate of the number of clusters in E. The performance of this new technique is demonstrated on both synthetic and real data, and is applied to the segmentation of range images. (Author abstract) 29 refs.

**076854 COMPUTING DISTANCE TRANSFORMATIONS IN CONVEX AND NON-CONVEX DOMAINS.** It is shown that the two-pass sequential local transformation algorithm for computing a distance transformation in rectangular domains may fail in some convex integer domains, but that a four-pass algorithm is sufficient in all two-dimensional convex domains. For non-convex domains the number of passes necessary is shown to be generally greater. Two proportional algorithms for computing the distance transformation are described and shown theoretically and experimentally to be computationally more efficient than the sequential local transformation algorithm in non-convex domains of complex shape. The relationship of the distance transformation in non-convex domains to some more general transformations is explored. (Edited author abstract) 14 refs.

**076855 PATTERN ADAPTIVE THINNING ALGORITHM.** A simple sequential thinning algorithm for peeling off pixels along contours is described. An adaptive algorithm obtained by incorporating shape adaptivity into this sequential process is also given. The distortions in the skeleton at the right-angle and acute-angle corners are minimized in the adaptive algorithm. The asymmetry of the skeleton, which is a characteristic of sequential algorithm, and is due to the presence of T-corners in some of the even-thickness pattern is eliminated. The performance (in terms of time requirements and shape preservation) is compared with that of a modern thinning algorithm. (Author abstract) 24 refs.

**076856 FAST ALGORITHM FOR THE COMPUTATION OF MOMENT INVARIANTS.** Moment invariants have been used as feature descriptors in a variety of object recognition applications. When assuming image function, moments calculated using a double-integral formulation, are invariant to variations in translation, rotation, and size of the object. However, due to the recursive nature of the calculations and the limited speed of microprocessors, the moments were not computable in real-time. We present fast invariant moment computations using the 'Delta Method', as a means of scene representation. This method computes moments of contiguous images by using the contribution of each line rather than individual pixel. (Edited author abstract) 11 refs.

**076857 HOW MANY CLUSTERS ARE BEST? - AN EXPERIMENT.** This paper reports the results of a Monte Carlo study on the relative effectiveness of two internal indices in estimating the true number of clusters in multivariate data. The two indices are the Davies and Bouldin index and a new modification of the Hubert  $\Gamma$  statistic. Data in d dimensions are clustered to create sequences of partitions. Estimates are based on plots of the indices as functions of the number of recovered clusters. Neither index uses a-priori information. The effects of sample size, dimensionality, cluster spread, number of true clusters, and sampling window are examined. Clustered data are generated to assure a given number of distinct clusters. The degree of clustering in the data is verified by a separate Monte Carlo study based on the Jaccard and corrected Rand indices that exhibits the importance of correcting external indices for chance. The modified Hubert index is shown to perform better than the

Davies-Bouldin index under all experimental conditions. Recovery of the true number of clusters gets better as the number of true clusters decreases and the number of dimensions increases. No effect occurs due to sampling window. The complete link clustering method and a square error clustering method recognize the true number of clusters consistently better than the single link method. This study demonstrates the difficulty inherent in estimating the number of clusters. (Edited author abstract) 24 refs.

**076859 POLYHEDRAL OBJECT RECOGNITION USING HOUGH-SPACE FEATURES.** We propose a new technique for three-dimensional (3-D) polyhedral object recognition on the basis of a single two-dimensional (2-D) view of a 3-D scene. The binary gradient image of the captured scene is converted into the Hough-space domain. The cluster patterns originating from straight-line features of the image are explored by reasoning in Hough space. This yields an attributed graph representation of CAD-designed wire frame model objects by means of a new attributed subgraph isomorphism algorithm. Simulation experiments illustrate this promising new approach. (Author abstract). 10 Refs.

**076860 OPTIMALITY OF REASSIGNMENT RULES IN DYNAMIC CLUSTERING.** The paper is concerned with reassignment rules for the dynamic clustering algorithm family which includes ISODATA. It is shown that these iterative clustering algorithms do not guarantee that each stable partition is locally optimal. The main result derived is a multiple-point reassignment rule which assumes a Gaussian density model for each cluster. The new rule should reduce the changes of the iterative optimization algorithm yielding partitions which do not correspond to local minima of the clustering criterion. (Edited author abstract). 12 Refs.

**076862 CLASS OF LINEAR MAPS FOR ERROR CORRECTIVE DIMENSIONALITY REDUCTION OF BINARY TEMPLATES.** Binary templates are optimally encoded in a reduced dimension by a proposed class of linear maps that preserves the local neighborhood and a prescribed minimum distance between the prototypes to a workable extent. This in effect generates a nearness

criterion suitable for template matching with a level of error correcting capability in the reduced space while requiring only a fraction of memory storage space and Boolean operations that would have been required otherwise. Characters and symbols may now be designed with reference to separation and shape but with a comparative freedom from the constraint of dimension, while a volume of such data can be transmitted with the speed and bandwidth of the encoded data. Some of the principal problems associated with template matching are thus overcome. All necessary operations are performed in the finite field GF(2) and the methodology developed can be implemented in a microcomputer with improved system performance and economy. (Edited author abstract). 21 Refs.

Automation

**076863 TOPOLOGICAL APPROACH TO THE MATCHING OF SINGLE FINGERPRINTS; DEVELOPMENT OF ALGORITHMS FOR USE ON ROLLED IMPRESSIONS.** Fingerprint comparison algorithms based on topological codes are considered. Detailed analysis of the performance of algorithms is given, making extensive use of the results of investigation into the 'match' and 'mismatch' score distributions produced by each one. A final test is described in which the most effective 'topology-based' algorithm was directly tested against one of the best existing 'spatial' algorithms. Topology-based coding, with the inclusion of a crude 'distance measures,' is found to be an extremely accurate and efficient basis for the comparison of rolled impressions. The motivation for seeking topological descriptions of single fingerprints is provided by the elasticity of the human skin; successive rolled impressions from the same finger will invariably have suffered a degree of relative distortion (translation, rotation and stretching). (Edited author abstract) 5 refs.

**076864 AUTOMATIC ROTATIONAL SYMMETRY DETERMINATION FOR SHAPE ANALYSIS.** The determination of the rotational symmetry of a shape is useful for object recognition and shape analysis in computer vision applications. A simple, but effective, algorithm to analyze the rotational symmetry of a given closed-curve shape S is proposed. A circle C with the centroid of S as the circle center and the average radius of S as the circle radius is superimposed on S, resulting in the intersection of C and S at a set of points. By analysis, the relationship between the order  $N_s$  of the rotational symmetry of S and the number of intersection points between C and S is established. All possible values for  $N_s$  are determined.  $N_s$  is determined by evaluating the similarity between S and its rotated versions. In the proposed algorithm, only simple pixel operations and second-order moment function computation are involved. Several problems caused by the use of discrete image coordinates are analyzed and solved for correct decision-making in the algorithm. Experimental results are included. (Edited author abstract) 26 refs.

**076866 REAL-TIME HOUGH TRANSFORM PROCESSOR.** One of the disadvantages of the Hough transform, its long computation time, is preventing this transform from being used in real-time applications. This paper presents an architecture that was developed to address this problem and implemented in an experimental hardware model for real-time straight-line detection. This paper provides examples of applying this architecture to the automatic inspection and measurement of objects in factories and laboratories. In these examples, it took less than one second to extract straight-line parameters from captured pictures. The highly parallel architecture proposed for the Hough transform does not require any multiplication or trigonometric calculations at run time. (Edited author abstract) 21 refs.

Computer Simulation

**076867 VIEWPOINT INDEPENDENT MODELING APPROACH TO OBJECT RECOGNITION.** A robotic vision system is being developed which uses three-dimensional laser range data to sense its environment. The recognition subsystem incorporates topological as well as geometric information to identify viewed objects. Theorem-proving techniques are used to produce symbolic pattern matches. The major contributions of the recognition subsystem are 1) the use of viewpoint-independent descriptors as the basis for representing known object models and 2) the use of theorem-proving techniques to hypothesize object identities and recognize the viewed object as an instance of the appropriate viewpoint independent model descriptor. The representation scheme permits describing objects at a variety of topological and geometric levels. Furthermore, the use of viewpoint-independent descriptors facilitates object recognition from a single arbitrary view despite missing information or the inclusion of viewpoint-dependent artifacts. 13 refs.

**076868 MAXIMUM A POSTERIORI APPROACH TO OBJECT RECOGNITION WITH DISTRIBUTED SENSORS.** The maximum a posteriori (MAP) estimation concept is applied to the problem of object recognition with several distributed sensors. It is shown that in binary object recognition the MAP object recognition also minimizes the mean-square error. Simulation results show that the performance of the MAP object recognition is, in general, at least as good as the best performance by the sensors used. 7 refs.

Efficiency

**076869 EFFICIENCY OF LEARNING WITH IMPERFECT SUPERVISION.** We consider the problem of supervision errors in training samples in two-group discriminant analysis based on normal distributions. Using a model for training sample misclassifications, we derive Efron's Asymptotic Relative Efficiency (ARE) of the discriminant function estimated under this model, relative to the case when classification is perfect. We tabulate this ARE for certain values of the Mahalanobis distance between the groups and for various levels of supervision errors. We show that training samples are

useful even if prone to a certain amount of misclassification. Our formulae and tables give, for a training sample prone to a certain amount of error, sample size equivalent to that of the one error-free training sample as well as that of an unsupervised sample, the equivalence being in terms of estimation efficiency. (Author abstract). 12 Refs.

Estimation

**076870 MAXIMAL MATCHING OF 3-D POINTS FOR MULTIPLE-OBJECT MOTION ESTIMATION.** Determining the relative motion/position between an observer and its environment is important in computer vision. A major task is to find corresponding object features. An efficient algorithm for matching 3-D points of multiple rigid objects is presented. The point-matching algorithm determines the correspondence by initiating a pairing of a triplet of noncollinear sensed points with a triplet of reference points and searching for new pairs of corresponding points, one at a time, using local distance and angular constraints. The pairing of each subsequent sensed point with a reference point is determined if the tetrahedron formed by the sensed point and the initial triplet is congruent to that formed by the corresponding reference points. Only simple computations are required in the algorithm. Global consistency of the pairings found by the algorithms is ensured without using model tests. The algorithm can be extended to incorporate other geometrical or non-geometrical object attributes to further prune the matching. Results of running the algorithm on synthetic and real data are given. (Edited author abstract). 19 Refs.

**076871 USING DOMAIN KNOWLEDGE IN A LOW-LEVEL VISUAL PROCESSING TO INTERPRET HANDWRITTEN MUSIC: AN EXPERIMENT.** Turning handwritten scores into engraved scores consumes a significant portion of music publishing companies' budget. Pattern recognition is the major bottleneck holding up automation of this process. Human beings who know music can easily read a handwritten score, but without musical knowledge, even people cannot correctly perceive the markings in a handwritten score. This paper reports an experiment in which knowledge of music, a highly structured domain is applied to extract primitive musical features. This experiment shows that if the domain of image processing is well defined, significant improvements in low-level segmentations can be achieved. (Author abstract) 17 refs.

**076873 NOISE EFFECTS ON CENTROID TRACKER AIM POINT ESTIMATION.** An investigation of errors due to noise in centroid tracker aim-point estimation is presented. The centroid tracker discussed is similar to the tracker described by A.L. Gilbert et al. (1980). Simplifications to this algorithm were made so that

the derived models would be consistent with the actual tracker algorithm. Two statistical models are derived which relate image noise effects to computation of the target centroid. The first model, the simplified aim-point error model, is derived by assuming that the probabilities of incorrectly classifying target and background pixels are equal. The second model, the extended aim-point error model, is derived by assuming that the probability of incorrectly classifying a target pixel can differ from the probability of incorrectly classifying a background pixel. These models are described and their mathematical implication are discussed. Simulation results which verify the models are presented. 5 refs.

**076875 REPRESENTATION AND RECOGNITION OF OBJECTS FROM DENSE RANGE MAPS.** A system for object representation and recognition from dense range maps is presented. The system addresses three problems, namely, (i) object representation from a single-view dense range map, (ii) integrating data or descriptions from multiple views for model construction, and (iii) matching descriptions from a single unknown view to models. Although the main goal of the authors is to develop an algorithm for solving problem (iii), the authors briefly outline solution techniques with the aid of examples, for problems (i) and (ii) as well, to give a complete overview of the system. 42 refs.

## Medical Applications

**076876 ZERO-CROSSING INTERVAL CORRECTION IN TRACING EYE-FUNDUS BLOOD VESSELS.** We are developing a health screening system for color eye-fundus photography. The system is designed to detect the first signs of adult diseases, for which purpose it is important to detect and trace eye blood vessels. This paper describes a method of finding the papilla by Hough transform, and from there tracing blood vessels by a second-order derivative Gaussian filter. The width of the blood vessel is obtained as the zero-crossing interval of the filter output. The filter is adjustable to the current width of the blood vessel being traced. In this process, since the obtained zero-crossing interval is larger than the true width of an ideal step-wise blood vessel, it is corrected at each step. (Author abstract). 7 refs.

## Performance

**076877 APPROACH TO PERFORMANCE OPTIMIZATION IN FREQUENCY-WEIGHTED MEM-**

**ORY NETWORK PATTERN CLASSIFIERS.** The performance of memory network pattern classifiers based on a feature frequency-weighting scheme can suffer from an inappropriate arbitrary choice of zero-frequency component in the computation of discriminant functions. This letter assesses the effect of optimizing this factor, emphasizing the value of optimization in pairwise class discrimination, which is of particular relevance in the design of efficient hierarchical classifier architectures. (Author abstract) 10 refs.

**076878 ENSEMBLE AVERAGE CLASSIFIER FOR PATTERN RECOGNITION MACHINES.** The ensemble average classification method introduced is a new nonparametric classification procedure. In this method, ensemble average of training pattern vectors in each class is stored in a computer memory. Classification of an unknown pattern vector depends primarily on the difference between the stored ensemble average vectors and the unknown pattern vector. Performance of the new method in comparison with Bayesian (optimal) and perceptron classifiers has been studied through computer experiments. The results obtained showed that the new method provides classification rates as high as the Bayes classifier. However, it requires less computation complexity and higher storage memory than Bayesian and perceptron classifiers. (Edited author abstract). 6 refs.

**076879 PERFORMANCE MODELLING OF PATTERN RECOGNITION TECHNIQUES FOR CALIBRATION AND REGISTRATION MARK DETECTION.** One of the strengths of focused electron beam lithography systems for direct writing on wafers is the ability to use the electron beam in an imaging mode. By suitable processing of the image the positions of structures fabricated in early layers can be determined for the overlay of subsequent levels. Because the imaging and writing are performed with the same beam, accuracy is limited only by the performance of the pattern recognition algorithm. This paper presents the results of modeling two such algorithms. (Author abstract) 2 refs.

## Processing

**076880 RULE BASED CONTEXTUAL POST-PROCESSING FOR DEVANAGARI TEXT RECOGNITION.** The spatial relationships among the constituent symbols of Devanagari script play an important role in the interpretation of Devanagari words. There are a number of constraints on these spatial relationships which characterize Devanagari script composition syntax. When the word composition is not found to be syntactically correct, the symbols are substituted with their resembling counterparts. The symbol substitution rules are mostly heuristic in nature. Human interpretation normally involves application of script composition syntax rules and the symbol substitution rules in an interleaved fashion. This paper presents a design of a post-processor which corrects the Devanagari symbol string based on this observation. The composition syntax checker is represented in the form of a finite state machine. The substitution rules are in the form of condition action pairs giving flexibility to the system for easy alteration. Each substitution rule has a penalty associated with it and the accumulated penalty value for a word gives a measure of its confidence level. (Author abstract) 12 refs.

## Research

**076881 ROUGH APPROXIMATION OF SHAPES IN PATTERN RECOGNITION.** The paper approaches the nature of a feature recognition process through the description of image features in terms of the rough sets. Since the basic condition for representing images must be satisfied by any recognition result, elementary features are defined as equivalence classes of possible occurrences of specific fragments existing in images. The names of the equivalence classes (defined through specific numbers of objects and numbers of background parts covered by a window) constitute the best lower approximation of window contents (i.e., names of recognized features). The best upper approximation is formed by the best lower approximation, its attributes, and parameters, all referenced to th object fragments situated in the window. (Edited author abstract) 5 refs.

Wojcik, Zbigniew (Wichita State Univ, Wichita, KS, USA). *Comput Vision Graphics Image Process* v 40 n 2 Nov 1987 p 228-249.

**076882 MODEL-BASED RECOGNITION USING 3D SHAPE ALONE.** The author shows that shape data alone, without absolute size, are highly effective in constraining the size of the search space of matches to stored 3D object models. The shape constraints developed are applied to sparse and error-prone measurements of surface orientations and scaled depths (that is, depths scaled by a constant but unknown factor) synthesized from polyhedral models which themselves have six degrees of positional freedom with respect to the sensor. The matching paradigm used is that of Grimson and Lozano-Perez in which feasible interpretations of the data are obtained by requiring geometric consistency between metrics made on pairs of data and their associated matched pair of model faces and then tested by geometrical transformation. (Edited author abstract) 14 refs.

**Theory** See Also SYSTEMS SCIENCE AND CYBERNETICS—Man Machine Systems.

**076884 PREDICTING AZEOTROPY IN BINARY SYSTEMS FROM PATTERN RECOGNITION THEORY.** The authors present results on forecasting azeotropy (the presence or absence of an azeotrope) on the basis of physicochemical data for pure substances used with pattern-recognition theory. We employ an algorithm and software module as described previously with minor changes concerning mainly the data input and output. The predictive power of this model is largely dependent on how far the features or the transformations performed on them reflect the physical picture in the phenomenon, as well as on the representativeness of the training sample. The model has been tested on about 700 binary zeotropic and azeotropic systems with the optimum set of features, training parameters, and potential function, with these systems including substances representing various classes of organic compounds and water. Some of them were used for training and the rest for checking the forecasting power of the model. Predictions up to 85% were obtained with the control objects. It is thus possible in principle to forecast the presence or absence of binary azeotropes by pattern-recognition theory on the basis of the physicochemical parameters of the individual components. 6 refs.

**076887 MULTIPROCESSOR-BASED RECOGNITION SYSTEM FOR HAND-WRITTEN DRAWINGS.** This paper describes a multiprocessor-based drawing recognition system designed to provide a fast processing environment for various drawing recognition algorithms. The system has a multiprocessor-based architecture to realize a compatibility of high speed processing and software flexibility. For high speed processing, each processing unit (PU) has special functions for image processing, such as a two-dimensional memory access mechanism, bit data access modes, etc., and has a very large memory to execute look-up table processing. Experimental results have shown that the system composed of four PUs realizes 40 to 60 times faster processing than a 1 MIPS mini-computer does. (Author abstract) 10 refs. In Japanese.

**076888 PATTERN RECOGNITION BASED ON THE TRIPLE CORRELATION.** For recognising a certain pattern it is sometimes preferable not to look at the pattern itself but at a secondary signal. The auto triple correlation is a type of a secondary signal. It is quite resistant against additive noise, against photon noise and against blur caused by the turbulent atmosphere. We propose to recognise a pattern by comparing its auto triple correlation with the auto triple correlation of a reference pattern. The comparison can be performed as inner product, which can be computed by using an efficient algorithm. In an alternate approach the input is at first converted into its auto triple correlation. In that format certain disturbances can be removed efficiently. Next cleaned version of the input is computed. Finally, the cleaned input undergoes standard pattern recognition by means of matched filtering. (Edited author abstract) 17 refs.

langen, West Ger). *Optik (Stuttgart)* v 78 n 3 Feb 1988 p 117-120.

**076889 AUTOMATIC CIRCUIT DIAGRAM READER WITH LOOP-STRUCTURE-BASED SYMBOL RECOGNITION.** A high-performance logic circuit diagram reader was developed for VLSI-CAD (very large-scale integration-computer-aided design) data input. Almost all logic circuit symbols include one or more loop structures. A description is given of an efficient method for recognition of these loop-structured symbols. The proposed method consists of two processes: symbol segmentation and symbol identification. Symbol identification is achieved by a powerful hybrid method which uses heuristics to mediate between template matching and feature extraction. The entire symbol recognition process is carried out under a decision-tree control strategy. The entire recognition system for circuit diagrams is briefly explained, including character string recognition and connecting line analysis. Experimental results show that symbol recognition accuracy is more than 95% and that a Japanese Industrial Standard (JIS) A1-size (594 mm × 841 mm) drawing can be processed within 30 min. To evaluate the symbol recognition method, more than 800 drawings were read automatically. A reduction of about 50% in input time was obtained, compared to conventional interactive entry. 18 refs.

**076890 NEW CONCEPT IN BIOMETRIC IDENTIFICATION: 3-DIMENSIONAL HAND GEOMETRY.** A new type of biometric identifier which utilizes hand outline measurements made in three dimensions is described. This device uses solid state imaging with no moving parts. The important characteristics of accuracy, speed, user tolerability, small template size, low power, portability and reliability are discussed. A complete stand-alone biometric access control station with sufficient memory for 10,000 users and weighing less than 10 pounds has been built and tested. A test was conducted involving daily use by 112 users over a seven week period during which over 6300 access attempts were made. The single try equal error rate was found to be 0.4%. There were no false rejects when three tries were allowed before access was denied. Defeat with an artifact is difficult because the hand must be copied in all three dimensions. (Author abstract) 3 refs.

## Automation

**076892 AUTOMATIC RECOGNITION OF PRIMITIVE CHANGES IN MANUFACTURING PROCESS SIGNALS.** Manufacturing processes are generally monitored by observing sampled process signals. The purpose

of this monitoring is to ensure process and, thereby, product consistency and to help diagnose causes of process instability. We discuss a two-level knowledge-based procedure for automatic recognition of these primitive changes. This procedure involves applying syntactic analysis either directly to the raw process signals or, whenever not possible, to a filtered version of them. The first level, therefore, involves applying special purpose nonlinear filters which are designed to enhance or isolate a particular primitive variation in the signal. The second level consists of a signal interpreter process, written in LISP, which analyzes the filtered signals and produces a data structure to represent the primitive variations. A description of the entire interpretation system is presented, and an example illustrating the application of the method to a process signal of an actual aluminum strip rolling mill is shown. (Edited author abstract). 16 Refs.

## Computers

**076894 PATTERN RECOGNITION BASED ON COINCIDENCE DETECTION.** It has recently been suggested that a possible means by which the human brain recognizes visual patterns is by detecting the occurrences of coincidences in the firing of different visual neurons. In the present paper, this coincidence-detection hypothesis is first outlined, and its pros and cons discussed. Next, the basic proposal is modified and a technique developed which can be used for recognition of stationary and moving patterns by computers; in place of the complex retina a uniform bank of photo-sensitive devices is assumed to provide the signals to be analyzed. The proposed system is adaptive and can cater to linear translation, rotation and size-alteration of patterns. (Author abstract) 5 refs.

**076897 PARALLEL-PROCESSING OPTICAL-DIGITAL RECOGNITION SYSTEM AS A MODEL OF BIOLOGICAL VISUAL PERCEPTION.** An optical-digital pattern recognition system is proposed as a model of biological visual perception. The optical part of this system extracts in parallel the geometrical features of each divided part of a pattern by using multi-matched filters made by an integrated small lens array. The fundamental experiments on the miniaturized matched filter of the reflection type with a small lens of 3.3 mm diameter is reported, which show the feasibility to achieve the optical part of the proposed system. (Author abstract) 6 refs.

Agu, Maksahiro (Ibaraki Univ, Hitachi, Jpn); Akiba, Atsushi; Kamemaru, Shun-ichi. *Opt Commun* v 66 n 2-3 Apr 15 1988 p 69-73.

**076898 LAYERED NEURAL NETS FOR PATTERN RECOGNITION.** A pattern-recognition concept involving first an 'invariance net' and second a 'trainable classifier' is proposed. The invariance net can be trained or designed to produce a set of outputs that are insensitive to translation, rotation, scale change, perspective change, etc., of the retinal input pattern. The outputs of the invariance net are scrambled, however. When these outputs are fed to a trainable classifier, the final outputs are descrambled and the original patterns are reproduced in standard position, orientation, scale, etc. It is expected that the same basic approach will be effective for speech recognition, where insensitivity to certain aspects of speech signals and at the same time sensitivity to other aspects of speech signals will be required. The entire recognition system is a layered network of ADALINE neurons. The ability to adapt a multilayered neural net is fundamental. An adaptation rule is proposed for layered nets which is an extension of the MADALINE rule of the 1960s. The new rule, MRIL, is a useful alternative to the backpropagation algorithm. 15 refs.

Widrow, Bernard (Stanford Univ, Stanford, CA, USA); Winter, Rodney G.; Baxter, Robert A. *IEEE Trans Acoust Speech Signal Process* v 36 n 7 Jul 1988 p 1109-1118.

## Efficiency

**076899 COMPUTERS THAT LEARN.** This paper deals with the development of new computer designs called neural networks. The main advantage of neural networks is their ability to recognize patterns by being trained rather than programmed. Such networks are arrays of processors functioning in parallel. But they are quite different from the parallel processors that have come onto the market in the past few years. For one thing, they are analog, not digital. There are no bits of data as in conventional computers. Second, they are not directly programmed to carry out a given calculation. Rather, their behavior is controlled by a set of weights that determine the strengths of the electrical connections between each pair of processors. The machine is set up to change these weights to minimize errors - the difference between actual and desired performance. For example, one such machine, called NETalk compares its output with a prerecorded pronunciation of a written word.

## Imaging Techniques

**076900 AUTOMATIC WAFER INSPECTION SYSTEM USING PIPELINED IMAGE PROCESSING TECHNIQUES.** An automatic wafer pattern inspection system has been developed that can detect defective patterns 6  $\mu$ m or larger in multilayered wafer patterns at

a speed 30 times faster than that of a human inspector. The false-alarm rate is less than 0.5 occurrences/chip. This performance is achieved mainly by the use of a special comparison method between two adjacent patterns obtained through a single optical setup, and also by the use of digital design pattern data (CAD data). The main functions of the design pattern data are to specify the inspection area, to designate optimum parameters for inspection, and to separate defective portions into different layers, thereby facilitating the classification of the defects. All image processing is performed in one pass by a high-speed pipeline-structured image processor that can analyze an input image signal at a 7-MHz video rate. 13 refs.

Yoda, Haruo (Hitachi Ltd, Kokubunji, Jpn); Ohuchi, Yozo; Taniguchi, Yuzo; Ejiri, Masakazu. *IEEE Trans Pattern Anal Mach Intell* v 10 n 1 Jan 1988 p 4-16.

**076901 RULE BASED APPROACH FOR VISUAL PATTERN INSPECTION.** The authors investigate the use of a priori knowledge about a scene to coordinate and control bilevel image segmentation, interpretation, and shape inspection of different objects in the scene. The approach is composed of two main steps. The first step consists of proper segmentation and labeling of individual regions in the image for subsequent ease in interpretation. General as well as scene-specific knowledge is used to improve the segmentation and interpretation processes. Once every region in the image has been identified, the second step proceeds by testing different regions to ensure they meet the design requirements, which are formalized by a set of rules. Morphological techniques are used to extract certain features from the previously processed image for rule verification purposes. As a specific example, results for detecting defects in printed circuit boards are presented. 23 refs.

## Medical Applications

**076903 FACILITIES FOR DIGITAL PATTERN RECOGNITION: AN ECG DETECTIVE TRICK.** Algorithm for digital pattern recognition optimized for the demands of the physician are urgently needed. They have to provide high levels of recognition, accuracy, reliability, artefact rejection and flexibility in detecting different types of signal time-course. The microcomputer algorithm presented here works on the principle of Walsh-transformation of signal sections and in-image judging. The algorithm efficiently solves simple tasks, and also recognizes, for instance, ECG P-waves using the same algorithm. A test with 1054 randomly selected outpatient's ECG and with an additional 72 ECGs of inpatients with clinically proved myocardial infarcts produced the following results: The recognition ratio for the R-wave amounted to 98.8% with a failure ratio of 2.3%, while an initial common P-T-pattern was correctly recognized in 80.3% of cases, with a failure ratio of 4.9%. (Edited author abstract) 24 refs.

**076904 PEDESTRIAN PAVING IN URBAN AREAS - THE PATH AHEAD.** The paper describes investigations and trials, begun in 1982, aimed at improving urban pedestrian paving in Hong Kong. Laboratory and site trials, of both local and current overseas practice, led to recommendations for a 'standard range' of pavings which includes precast concrete slabs laid in sand, now to be manufactured locally using hydraulic pressing. Although costs using precast units are greater, there are operational and aesthetic advantages worth pursuing. It is opined that, with further development, costs will be reduced, to the benefit of maintenance and appearance of Hong Kong's pedestrian pavements. (Author abstract) 18 refs.

Tang, Kwok-kee; Cooper, Robert P. *Hong Kong Eng* v 14 n 6 Jun 1986 p 9-19.

**076905 OPTIMIZATION MODEL FOR PAVEMENT MARKING SYSTEMS.** An inventory and replacement cost optimization model for pavement marking systems has been developed. The optimum average inventory of performance and the period of replacement for minimum cost are defined. The model provides a basis for the establishment of implementation programs for pavement marking systems. (Author abstract) 10 refs.

**076906 LE RETRAITEMENT DES CHAUSSEES A L'EMULSION DE BITUME: ETAT DE LA TECHNIQUE EN FRANCE.** [Pavement Retreatment with Bitumen Emulsion]. Although a very old technique, the reatment of road pavements with bitumen emulsions has recently been the subject of significant developments, in particular with the high efficiency grinding process. In France, over 300,000 m<sup>2</sup> were treated in 1986, and about 600,000 m<sup>2</sup> will be treated in 1987. After having briefly reviewed the definition of this technique, the authors make a distinction between the reatment of bituminous mixes and that of an untreated pavement material and their fields of application. For each configuration, the outline, the principle of the technique and the implementation methods are presented. The article continues with a description of inspections and some cost evaluations, before concluding on the development of these techniques. (Author abstract) In French. 6 refs.

**076907 DESIGN OF FLEXIBLE PAVEMENT FOR A 650 TONNE CRANE.** In the construction of large structures such as power plants prefabrication of heavy components has been adopted as an efficient and economical method. For handling these prefabricated components, use of heavy-duty cranes is essential. Consequently, for the operation of such a crane, it is necessary to design appropriate pavement systems. Otherwise there is a possibility of undesirably large settlements under the working loads. For the safe working of a crane, the pavement thickness should be adequate for the magnitudes of the imposed load and the subgrade soil support should be adequate to prevent excessive settlement. The authors had worked out relationship curves for flexible pavement thickness vs. C.B.R. of a subgrade soil, for the 650 tonne crane as part of a consultancy assignment for the design of pavement systems for a power plant. The outcome of the design is presented in this paper. 2 refs.

Accident Prevention

**076908 EFFECTS OF SKID-RESISTANCE APPARATUS ON PAVEMENTS.** Skid-resistance apparatus, such as chains and studded tires, are used for safety of drivers in cold and snowy areas. The stress conditions in pavements are affected significantly owing to the apparatus. The stresses may produce fracture in pavements. This study describes the stress and strain conditions in pavements under static and dynamic loading in the case where skid resistance apparatus is used. The effect of the radius of loading contact patterns on stresses in pavements is analyzed. (Edited author abstract) 5 refs. In Japanese.

**076910 MODIFIZIERTER SPLITTMASTIXASPHALT.** [Modified Chips-Filled Mastic Asphalt]. Chips-filled mastic asphalts are based on formulations which were developed in response to the impact of spiked tires on the road net in the sixties. Main characteristics of the ingredients are outlined, further their contribution to the stability of the wearing courses is analyzed. A test series has been carried out with a gyrator to determine the correlation between growing percentages of Trinidad Epure in chips-filled mastic asphalt specimens and their effect in terms of performance improvements. The results are communicated. (Author abstract) 3 refs. In German.

Hartmann, Rainer (Deutsche Asphalt GmbH, Frankfurt, West Ger). *Str Tiefbau* v 41 n 4 Apr 1987 p 20, 23.

**076911 TRAINING CREWS IN ASPHALT RECYCLING.** Putting experienced personnel next to new people is one of the best ways to train recycling crews. Most respondents (70.6%) to a recent Better Roads' survey on asphalt recycling and training agree. The most important training method is use of on-site instruction, including demonstrations. The second-most popular method was use of seminars conducted by third parties, such as equipment manufacturers. One of the problems in using one-on-one training of new personnel is the fact that there are not always experienced foremen and supervisors available. Material preparation is considered the most critical stage in recycling by 57.1% of those responding to the survey. Recycling equipment, used on a site, is the main type of training material used by asphalt contractors.

Anon. *Better Roads* v 58 n 2 Feb 1988 p 35.

**076912 EFFECT OF EVA-MODIFIED BITUMENS ON ROLLED ASPHALTS CONTAINING DIFFERENT FINE AGGREGATES.** The changes in the rheological properties of petroleum bitumens after the addition of ethylene-vinyl acetate co-polymer (EVA) are described and the consequent effect on their use in rolled asphalt wearing course mixtures is reported. In particular, the

changes in the Marshall stability and deformation resistance using four asphalt sands of different stability are quantified. The relationship between these properties and the effect of the EVA component is discussed in detail, and equations are derived relating the Marshall stability of a conventional rolled asphalt wearing course to the Marshall stability of a rolled asphalt containing bitumen modified with 5 percent EVA for the same resistance to permanent deformation. (Author abstract) 8 refs.

**076914 RISSEMPFINDLICHKEIT HYDRAULISCH GEBUNDENER TRAGSCHICHTEN.** [Cracking Resistance of Hydraulically Compacted Load-Carrying Pavements]. A survey of the performance of binders used in construction of asphalt pavements is given. Recommendations for optimal pavement thickness and composition, based on experimental results, are given. 13 refs. In German.

Sonneward, P. (Gebhard Hinteregger GmbH & Co, Munich, West Ger); Schrage, I. *Tiefbau Ingenieurbau Strassenbau* n 2 Feb 1988 p 79-83.

**076915 ASPHALTBINDERSCHICHTEN FUER HOHE BEANSPRUCHUNGEN.** [Bituminous Binders for Higher Loads]. Asphalt binders can fail under high loads and lead to the destruction of the pavement lying above it. The damage consists either in the loosening up of the bituminously bound debris by pumping water or in a plastic deformation which results in rutting. Measures are shown which can prevent this kind of damage. They are based on the results of a test stretch of 2,640 m with 11 sectors of different binder design. The load amounted to over 80,000 automobiles per day, including about 13% of trucks. The drainage of the binder layer must be ensured. A denser cavity proportion (5-6 vol.%), a higher content of the binder medium, as well as the use of modified binders are recommended. The composition of the asphalt is also important. This involves: mineral composition, binders, aggregate material, placement, and compaction. (Translated author abstract) In German.

Damm, Klaus-Werner (Fachhochschule Hamburg, Hamburg, West Ger). *Str Autobahn* v 38 n 7 Jul 1987 p 255-262.

**076916 PROFILES OF MATERIAL RESISTANCE TO COMPACTION.** The work described in this paper is part of a research program to define the process of layer densification and chip embedment with wearing course hot rolled asphalt. The process is complex and differs from the densification of other pavement layers in that stone chippings are being impregnated into the layer surface. With bituminous materials, their supporting power relates not just to the degree of internal friction but also to the viscosity of the bituminous binder and mix proportions. Although the work recorded has related to two wearing course hot rolled asphalts the procedure to define profiles of supporting power and the interpretation of the results would apply to any bituminous mix. (Edited author abstract) 20 refs.

**076917 STABILITY OF HRA WEARING COURSES.** Hot rolled asphalt as used in the UK is surfacing material with about one hundred years history. Modern HRA wearing course material has several advantages over continuously graded macadam, for: (1) its gap-graded nature, with a high proportion of fines giving a large surface area, can contain more bitumen than coarser materials, and this higher volume of water proof 'glue' helps durability; (2) the workability of HRA is high, giving good compaction characteristics; (3) its pore structure results in a virtually impermeable layer; (4) its strength in tension, as measured by fatigue resistance, is high. 9 refs.

**076920 REJUVENATOR DIFFUSION IN BINDER FILM FOR HOT-MIX RECYCLED ASPHALT PAVEMENT.** An investigation was undertaken to determine the extent to which certain types of rejuvenators diffuse into the hardened asphalt film coating the aggregate and affect its properties during a specified period of time. A partial extraction technique that had the effect of dividing the asphalt film into microlayers was used. The binder recovered from each microlayer was characterized by means of consistency tests. This technique was used to evaluate the consistency distribution of the binder film around the aggregate in (a) the extracted mix containing recycled asphalt pavement (RAP) only; (b) the extracted mix containing RAP and a rejuvenator; and (c) the extracted mix containing RAP, virgin aggregate, and a rejuvenator. (Edited author abstract) 11 refs.

**076922 SULFUR AS A PARTIAL REPLACEMENT FOR ASPHALT IN PAVEMENT.** A full-scale experiment on introducing sulfur as a partial replacement for asphalt in road-paving mixtures was conducted in Kuwait. Laboratory and field testing programs were designed and carried out to analyze and investigate the results of this experiment. The optimum sulfur percentage in the sulfur-asphalt binder and the optimum binder content were established for the investigated mixtures at various curing ages. The sulfur-asphalt mixture was found to significantly reduce rutting on the road. This was established in both field and laboratory investigations. Laboratory-aged samples showed longer fatigue life (indirect tensile stress control fatigue test). Inclusion of sulfur in the mixture was also shown to improve Marshall stability, indirect tensile strength, and the rate at which strength was gained during curing. (Edited author abstract) 11 refs.

Bayomy, Fouad M. (King Fahd Univ of Petroleum & Minerals, Dhahran, Saudi Arabia); Khedr, Safwan A. *Transp Res Rec* 1115, Asphalt Mater and Mixtures. Publ by Transportation Research Board, Washington, DC, USA, 1987 p 150-160.

**076923 FIELD EVALUATION OF SULFUR-EXTENDED ASPHALT PAVEMENTS.** Twenty-six sulfur-extended asphalt (SEA) paving projects, constructed between 1975 and 1982 in 18 states, were surveyed to measure the incidence and severity of major, visible types of pavement distress. Present condition indices were calculated for each of the SEA pavements and for each pavement in a control group of closely matched, conventional asphalt concrete pavements. Analysis of the evaluation results indicates that the presence of 20 to 40 percent by weight of sulfur in the paving binder had no deleterious effect on the overall performance of SEA pavement but yielded not significant improvement compared with the control group. Within the limits of the analysis, the measured types of distress and their severity were not significantly affected by variation in the sulfur content of the paving binder. (Edited author abstract) 5 refs.

**076924 RECYCLING WASTE ROOFING MATERIAL IN ASPHALT PAVING MIXTURES.** The technical feasibility of using waste roofing products in asphalt concrete paving mixtures is addressed. Approximately 9 million tons of roofing waste are generated annually in the United States. Disposal costs are significant. Recycling represents an economical and, perhaps, environmentally attractive alternative to placing these wastes in landfills. The relatively large quantities of asphalt cement and aggregate-type materials present in roofing waste suggest that these materials have potential as a partial substitute for asphalt cement or aggregate, or both in a paving mixture. A study that arrived at the presented conclusions was conducted. (Edited author abstract) 10

**076925 PROCEDURES FOR ESTIMATION OF ASPHALT CONCRETE PAVEMENT MODULI AT IN SITU TEMPERATURES.** The need for methods to evaluate the moduli of pavement layers without excessive extrapolation error is most apparent when NDT data and iteration methods are used to solve for the moduli of three- or four-layer systems. This is particularly true when the asphalt concrete modulus ( $E_1$ ), which is affected by temperature, layer thickness ( $t_1$ ), and the stiffness of underlying pavement layers, is considered. Two methods of providing a more direct approach for the estimation of  $E_1$  have been presented: 1. The first method involves the direct measurement of horizontal strain in the dynamic indirect tension test and computation of  $E_1$ . This method is only limited by specimen size and a sufficiently high binder viscosity. Otherwise, reproducible test results and reliable  $E_1$ -values are obtained for most mixtures. 2. The second method is considered an indirect estimate of  $E_1$  because recovered asphalt viscosity has been related to  $E_1$ -values obtained from direct measurement. 10 refs.

**076926 BEWAHRUNG VON ASPHALTDECKSCHICHTEN MIT NATURASPHALT IN OESTERREICH.** [Good Performance Record of Bituminous Pavements Containing Natural Trinidad Asphalt in Austria]. There are two major basic concepts of asphalt mix formulations contrasting in contents of binder and voids, the one of them featuring a relatively high binder contents and a low voids percentage, the other one a high voids percentage and less binder. To clear up the uncertainties a systematic investigation has been made in Austria in 1987 at 23 road sections evaluating the state of the road after 10 years of service and the alterations the asphalt mortar had undergone. The results obtained can be interpreted as proving better the concept of high binder contents and low voids percentage in all sections where it was supported by adding 1.3 to 2.5 per cent of natural Trinidad asphalt, which exert a stabilizing effect. (Author abstract) 1 ref. In German.

**076927 RESULTATS DES ESSAIS CROISES BITUMES ET BITUMES RECUPERES.** [Results of Inter-Laboratory Tests on Bitumens and Recycled Bitumens]. The creation of the National Testing Network led the Public Work Laboratories to organize inter-laboratory tests on bitumen. This article describes the organization of these tests and the use made of their results. For each of them, the author gives the values of fidelity (repeatability and reproducibility) which they produce, together with two practical applications, one of them defining the limit of agreement between two test results obtained in two laboratories, the other defining the lower limit permitted of specifications. This latter information is of particular value at a time when bitumen specifications are being revised. (Author abstract) In French.

Vaniscote, Jean-Claude (Lab Central des Ponts et Chaussées, Fr). *Bull Liaison Lab Ponts Chaussees* n 153 Jan-Feb 1988 p 29-36.

**076928 DESIGN OF ASPHALT MIXES FOR HOT CLIMATES.** Performance standards of various asphalt layers play an important role in the many aspects of the paving industry. The performance of asphalt mixes is dependent on: the quality of the mix; the engineering characteristics of the mix; the standard of quality control during the laying of the mix; engineering characteristics of the granular layers of paving, and particularly those of flexibility, rigidity and adhesiveness; traffic load and

types; temperature, humidity and drainage conditions. This paper presents proposals for the quality of the mix components. The maximum water absorption of the aggregate must not exceed 2%. The ratio of filler to bitumen should be between 1.0-1.5. The permitted quantity of natural sand additive must on no account be higher than 5% of the total aggregate weight. (Edited author abstract) In Hebrew.

Livneh, M. (Technion, Haifa, Isr). *Handassa (Tel Aviv-Jaffa)* v 46 n 13 Dec 1987 p 14.

**076929 ASPHALT INNOVATIONS: PREVENTIVE MAINTENANCE CUTS COSTS.** Preventive maintenance (PM) can often extend asphalt pavement life for a number of years - at relatively low costs. This article discusses methods of asphalt PM discussed by E.R. Brown at this year's Transportation Research Board meeting. Rejuvenators, slurry seals, surface treatments, and crack sealing are good PM techniques, according to Brown. The maintenance procedure should be selected for a specific project, and the treatment designed for that project. The article discusses how this is done.

**076930 MECANISMES DE FISSURATION DE SURFACE DES COUCHES DE ROULEMENT.** [Mechanisms of Surface Cracking in Pavement Wearing Courses]. The authors describe a method of analysing permanent deformations in pavement wearing courses. The method consists of superposing two models of calculation: A model predicting the degree of cracking by thermal fatigue, for cracks initiated from the surface, A model of mechanical behaviour, to take account of moving loads on these cracks of thermal origin. The first model estimates the degree of cracking and its rate of propagation, solely from the thermal point of view, in the light of weather conditions on the site and the characteristics of the mix or the bitumen laid or selected. Cracking is simulated by means of a two-dimensional finite elements model which allows a satisfactorily approximate calculation of the factors of stress intensity. The rate of propagation is calculated, for 3 cases of loading, by integrating the law of Paris and determining the number of cycles and corresponding damage for the crack to attain the interface between the wearing course and the underlay. (Edited author abstract). 19 Refs. In French.

**076931 CALCUL DE STRUCTURES A L'ORNIERAGE: PROGRAMME CASTOR.** [Structural Design for Rutting Resistance: CASTOR Program. Method of Predicting Permanent Reformation in Bituminous Structures]. The calculation of permanent deformations is based on a two-dimensional model (transverse profile of the pavement) using a finite elements code. The model takes four types of parameters into account: the geometry of the structure (thickness); the traffic characteristics (number, weight, speed, lane distribution); the laws governing the behaviour of the materials (master curve and law of flow of bituminous materials); and the temperature profile in the structure. Permanent deformations are calculated over elementary periods, while the input parameters remain constant. At each stage, the geometry is updated and memorized so as to record the history of rutting during the period of reference. After describing the method, the author gives an illustration: the simulation of the test using a rutting wheel. This model has been the subject of a software programme, 'Castor', set up on an IBM PC compatible microcomputer. (Edited author abstract). 11 Refs. In French.

## Bituminous

### 076933 LABORATORY TESTING OF MACADAM.

In several parts of Britain problems have been experienced with the premature deterioration of bituminous macadam wearing courses. Some failures have occurred only weeks or months after laying compared with an expected lifetime of perhaps five to 10 years. The deterioration affects road surfaces in several different ways including fretting, loss of stone, pitting, potholing and lateral migration or flowage of the surface layer. This paper investigates the performance of dense bituminous macadam wearing course mixes tested under controlled laboratory conditions. 24 refs.

## Brick Construction

### 076934 CLAY PAVERS GET FULL TECHNICAL SUPPORT.

Brick paving has been around for centuries. Its visual attributes are well-known, including color fastness, resistance to staining from oil and other spillage, and its sympathy and context with the buildings nearby. As a warm and natural paving material, clay brick pavers have no equal. Structural performance, durability and skid resistance have been the focus of ten years' research by the Brick Development Association. This study reports on the wealth of information now available to specifiers.

Smith, Richard. *Highways (Croydon Engl)* v 56 n 1939 Jul 1988 p 12, 14.

## Coatings

### 076935 EMULCOL: NOUVELLE CONCEPTION DE L'ENDUISAGE. [EMULCOL: New Coating Concept].

EMULCOL, a new concept in pavement surface coating, is an innovative product developed by COLAS to meet specific requirements expressed by today's engineering specialists. It is a product whose innovation lies in the possibility of simultaneously spraying a special emulsion and a breaking agent on the emulsion brushes of a sprayer. It was possible because COLAS made a major commitment and devoted a substantial part of its R&D resources to its development for a number of years. It was tested thoroughly on a series of projects. It is given marketing support by demonstration sites and advertising campaigns. (Edited author abstract) In French.

## Computer Aided Analysis

### 076936 SENSITIVITY ANALYSIS OF SELECTED BACKCALCULATION PROCEDURES.

The evaluation of existing pavement systems is necessary to meet today's demands for higher magnitudes of traffic loads and intensity. In particular, there exists a need for a reliable, quick, and nondestructive tool that permits the evaluation of pavements to obtain accurate information about existing structural conditions. Several types of nondestructive testing equipment and analysis procedures have been developed and are currently available. Their use in predicting pavement layer moduli must be carefully evaluated, as this particular application is now an integral part of the new AASHTO overlay design procedure. BISDEF, MODCOMP2, and SEARCH analysis procedures

were evaluated and the sensitivity of the backcalculated moduli to variations in input parameters was investigated. Results obtained for typical asphalt concrete and aggregate-surfaced pavements showed that the backcalculated moduli were sensitive to several of the user-supplied inputs. (Edited author abstract) 12 refs.

### 076937 FEACONS III COMPUTER PROGRAM FOR ANALYSIS OF JOINTED CONCRETE PAVEMENTS.

A computer program named FEACONS III (Finite Element Analysis of Concrete Slabs) was developed in response to a need for a suitable analytical model to analyze the behavior of concrete pavements effectively and realistically. The program has been used extensively in the analysis of existing concrete pavements and a test road in Florida. The analytical model and computational procedure used by FEACONS III are described in detail. The FEACONS III program was shown to be both versatile and effective in the analysis of concrete pavement response. The modeling of the edge stiffness and the linear joint stiffness and torsional joint stiffness produces fairly realistic analytical results. It is hoped that this paper can enhance proper usage of the program and increase the awareness of highway engineers of the importance of the effects of temperature, joint, edge, and subgrade conditions to concrete pavement response. (Edited author abstract). 8 Refs.

## Computer Aided Design

### 076938 COMPUTER ORIENTED DESIGN FOR FLEXIBLE PAVEMENTS.

This paper presents a computer program developed for arriving at the thickness of flexible pavement based on the recommendations of the Indian Roads Congress. Cost economy factor in pavement construction has also been considered in this paper by using different types of materials for construction of sub-base and base course layers. This analysis has indicated that the optimum system of pavement construction consists of a sub-base course of stabilized soil-lime-flyash layer and a base course of hot mixed bituminous macadam. 2 refs.

### 076939 MECHANISTIC DESIGN CONCEPTS FOR HEAVYWEIGHT F-15 AIRCRAFT ON FLEXIBLE PAVEMENT.

A new F-15 aircraft is now the heaviest fighter aircraft in the United States Air Force inventory. A mechanistic design procedure is developed for flexible pavements to accommodate the heavyweight F-15 loading. The ILLI-PAVE finite element computer program is used as the structural model to compute pavement structural responses. Design algorithms are developed from an ILLI-PAVE data base and are demonstrated in an example problem. The proposed design procedure is then compared with the present U.S. Department of Defense (DOD) procedure. The DOD procedure does not adequately consider asphalt-concrete fatigue effects. DOD minimum surface thickness requirements may not be sufficient to prevent premature cracking of pavements subjected to long-term use by the heavyweight F-15 aircraft. (Edited author abstract) 24 refs.

### 076940 DESIGN OF FOOTWAY PAVING FLAGS.

In urban areas, precast concrete paving flags, which provide an aesthetically pleasing and uniformly comfortable walking surface, are the usual form of surfacing for pedestrian footways. With the introduction of pedestrianization into urban areas, it has become necessary for

highway design engineers to give consideration to a number of important problems, viz. the way in which pedestrian areas are surfaced; the provision of adequate access and specially strengthened routes for delivery and emergency vehicles, so that the pedestrian surface is not destroyed by those vehicles; the effects of the public utilities trenching and local authority routine maintenance activities. The computer based analytical modelling of the paving flag pavement, relied heavily upon the mathematical 'finite element method' of analysis. This method of analysis allowed the complex requirements of the laboratory testing, on-site vehicular loading and the paving flag test procedure to be interrelated to produce the required paving flag design package. 8 refs.

### 076941 ENTWICKLUNG UND ANWENDUNG VON COMPUTER-BEMESSUNGSVERFAHREN FUER BETONSTEINPFLASTER. [Evolution and Application of Mechanistic Design Procedures for Concrete Block Pavements].

This paper describes the evolution of computer-based mechanistic procedures for the design of concrete block pavements for both roads and industrial hardstands. The procedures include sophisticated modelling both of the design traffic and of the properties of the pavement materials. The significance of these models is discussed and their relevance is critically assessed by reference to a series of tests of block pavements conducted by the author from 1978 onwards. These tests included both accelerated trafficking trials of a wide range of prototype pavements and FWD studies of pavements currently in service in Australia. The paper concludes with a description of the application of the design procedures to a range of segmental pavements around the world. (Author abstract). 31 Refs.

### 076942 CONCRETE PAVES THE WAY.

Two interesting British developments which point to a healthy future for continuously reinforced methods involve bituminous materials as well as concrete. On a different section of the M18, Humberstone County Council are pioneering the use of CRCP as a remedial overlay to a failing blacktop motorway. The second innovation is best described as the 'Son of CRCP'. The new British DTp Departmental Standard on Paving Design, which is due to be published this autumn, is thought to include the provision of continuously reinforced concrete roadbase (CRCR) alongside CRCP as an approved method of construction. This method, which is sometimes referred to as CRCP (for Base), essentially a lighter CRCP slab acting as the roadbase, upon which is laid a bituminous wearing course. It offers all the advantages of long working life associated with concrete pavements (typically twice that of their flexible counterparts), with the good riding qualities of blacktop.

Swan, Russ. *Int Constr* v 26 n 9 Sep 1987 p 76-78, 81, 85.

### 076943 DER BETONPFLASTERSTEIN - EIN GESTALTUNGSELEMENT DURCH FORM UND FARBE. [Concrete Paving Stone - A Design Tool for Shaping and Coloring].

The outstanding advantages of industrialized production of concrete paving blocks: high quality; high loadbearing capacity; great variety in shape and coloring; easy to place by hand or machine; and recovery of already laid stones and subsequent reutilization, have been opening up ever new areas of application for concrete paving stones. Concrete paving blocks have

long since become a trade-mark article and a major sales item for most concrete block producers. In German and English.

Schmidt, Johannes. *Betonwerk Fertigteil Tech* v 53 n 8 Aug 1987 p 537-540.

**076944 BETON-VERBUNDSTEINPFLASTER. [Interlocking Concrete Block Paving].** The paper reports the results of more than eight years of accelerated trafficking studies on in excess of 100 full-scale concrete block pavements. The evolution of a soundly based technology for the design and construction of concrete block pavements based on the data from these tests is then described. Three aspects of block paving were investigated. These comprised the nature of the block paving surface including studies of the influence of the type, shape, thickness, laying pattern and strength of the paving blocks, studies of a wide range of base and subbase materials and the evolution of comprehensive design procedures for block paving in both road and industrial paving applications. Particular emphasis is placed on the development of computer-based methodology for the design of block pavements. (Edited author abstract) In German and English. 20 refs.

Shackel, B. (Univ of New South Wales, Sydney, Aust). *Betonwerk Fertigteil Tech* v 53 n 8 Aug 1987 p 541-547.

**076945 BRIEF HISTORY OF SMALL ELEMENT PRECAST CONCRETE PAVING FLAGS.** Precast concrete flags have been used for paving footways in British cities for nearly a century and BS 368 was first published in 1929, setting a national standard for this widely used product. Flags have proved popular for several reasons, including performance and user preference, aesthetics and economics. In addition they can be lifted to provide easy access to underground services and re-used when a trench is reinstated, returning a footway to its original condition. The theories were checked by laboratory tests, in which a total of 55 flags were subjected to a static load. 2 refs.

Lilley, Alan (Cement & Concrete Assoc). *Civ Eng (London)* Sep 1987 p 13, 15-16, 18.

**076946 CONTINUOUS CONCRETE ROAD PAVEMENTS.** The article examines continuous concrete road pavements without transversal joints: the concrete slab in fact contains continuous reinforcing, enabling the regulation of cracking by eliminating the transversal joints. The subject is divided into four parts: dimensioning; (the concrete slab performs the task of withstanding the load action while the reinforcing has the task of limiting the opening of the cracks); construction (concrete placing is usually carried out by a slipforming machine with front or lateral in-feed); costs (the greater cost of the reinforcing steel is partly compensated by the lack of transversal joint costs); special uses (continuous concrete pavements can be used for the covering of deteriorated concrete or asphalt pavements, or for the paving of secondary roads). (Author abstract). In Italian. 22 refs.

Bologna, Gaetano. *Ind Ital Cem* v 57 n 1 Jan 1987 p 44-59.

**076947 CONCRETE PAVING HITS THE FAST TRACK.** High-production, heavy-duty pavement will be mostly limited to airports, an occasional new freeway or turnpike, and to the reconstruction of rural Interstates, often featuring monolithic concrete shoulders. The reconstruction of urban freeways with emphasis on coordination and scheduling is foreseen. The new markets in the concrete paving field are: fast track resurfacing with 'type III' high-early strength PC; concrete pavement restoration (CPR), now proven to repair worn concrete pavements with a smooth-riding, skid-resistant surface; recycling concrete as base stone or specification aggregates when replacing pavements; and porous concrete base - a new idea for base construction.

Knutson, M.J. (American Concrete Pavement Assoc, USA); Riley, Randall C. *Highw Heavy Constr* v 130 n 3 Sep 1987 p 80-83.

**076948 DONT LET DEICERS SCALE YOUR**

**CONCRETE.** In the winter, some concrete pavements won't make it through the freezing cold and deicing salt applications without damage. Some concrete will scale. The top 1/16 to 3/16 inch will slowly - sometimes quickly - flake away. But it doesn't have to. How to prevent it? How to keep the concrete from scaling? No matter what else one does, one must use air-entrained concrete. The billions of microscopic air bubbles created by air entrainment relieve the pressures that result when absorbed water freezes and expands. Without these billions of relief valves, the concrete scales. In severe freeze-thaw exposures, fresh concrete should contain 5.5 to 7.5 percent air, depending on the maximum aggregate size. But entrained air alone doesn't guarantee freeze-thaw durability. The author cites other good practices to be followed: slope exterior flatwork for draining off water, using concrete with a water-cement ratio no higher than 0.50, prolonged curing of concrete, and some other recommendations.

Wallace, Mark. *Concr Constr* v 32 n 11 Nov 1987.

**076949 PAVING WITH RCC.** Use of roller compacted concrete (RCC) for pavement is growing rapidly in the U.S. and Canada, both in civilian and military construction. Roller compacted concrete pavement differs from the RCC used for dams as well as from the conventional materials it replaces. Costs aren't the only difference between RCC and other materials and construction procedures. It differs from soil cement in that it has coarse aggregate, from cement treated base in that it has a higher cementitious material content, and from both in its use as a smooth surface course that must withstand traffic and weather.

Keifer, Oswin Jr. *Civ Eng (New York)* v 57 n 10 Oct 1987 p 65-68.

**076950 STRUCTURAL DESIGN OF CONCRETE PAVEMENTS.** In the last 30 years multi-layer elastic theory has been applied with some success to the design of flexible pavements, and particularly those with cemented bases. During 1984-1985 the involvement of the authors in an investigation of the performance of some 2000km of very variable strength concrete roads in the Philippines carrying very heavy wheel-loads made it essential to develop a theoretical design procedure relating axle loading, pavement thickness and concrete strength. The present paper arises from that work. 10 refs.

**076951 CONCRETE PAVEMENT ON A9 TRUNK ROAD: CONDITION AFTER 50 YEARS.** One of the most interesting features of this road when it was built was the novel adoption of reinforced concrete for the construction of five sections of the road, between Carrbridge and Tomatin, which traversed deep peat deposits. Fifty years later the road was again rebuilt, this time from Perth to Inverness. The construction of the section from Slochd Summit to Dalmagarry required the removal of one of the old concrete sections and this presented an opportunity to inspect its construction and to observe how it had performed during its life. This paper discusses various aspects of the study, including design of the pavement, performance, condition of the materials, and other related subjects. 2 refs.

Livesey, K.H. (W.A. Fairhurst & Partners). *Proc Inst Civ Eng (London)* v 82 pt 1 Oct 1987 p 995-1005.

**076952 BETONFAHRBAHNTECHNIK IN BELGIEN. [Concrete Road Pavements in Belgium].** Planning and execution of concrete road pavement construction in Belgium are outlined, furthering the practice for the kinds of roads concrete layers are generally applied. Another subject of the article are the criteria ruling the systematic inspections and road performance tests in Belgium. The positive evaluation of the concrete pavements leads the authors of this report from the Brussels Road Research Centre, on which this article is based, to the conclusion that it is particularly suitable also for developing countries. (Author abstract) In German.

14-16.

**076953 LANGZEITMESSUNGEN AN BETON-DECKEN. [Long Time Measurements of Concrete Pavements].** The data obtained by long time measurements of concrete pavements of test road sections with different structural designs on the A81 highway near Berolzheimer and on the A6 at Ansbach, with and without the conventional frost protection layer, shows that an increase in rutting, step formation, middle joint opening and loosening-up of the compound structure of concrete and the hydraulically bound carrier layer occur only after several years. The doweling of the heavily trafficked concrete lanes could not be avoided owing to step formation. The doweled concrete superstructure is adequately dimensioned with a concrete top thickness of over 22 cm for an axial load of 10 t. Continuation of long-time measurements is recommended. (Translated author abstract) 6 refs. In German.

Eisenmann, Josef (TU Muenchen, Munich, West Ger); Birmann, Dieter. *Str Autobahn* v 38 n 3 Mar 1987 p 81-86.

**076954 ZUM WIDERSTAND VON BETON-DECKEN GEGEN FROST UND CHEMISCHE ENTEISUNGSMITTEL. [Resistance of Concrete Pavement to Frost and Deicing Media].** Thawing salts, mostly sodium chloride, are used on roads for melting ice and solid snow layers. For environmental protection reasons these salts are used only in exceptional cases. Melting salts are unsuitable for use at airports because of their corrosive effects on materials used in aircraft construction. Liquid deicing media are used there. They consist mostly of glycol and urea. The effects of salts and the thawing media used at airports are compared. Urea, frigidin and LP 1678 thawing media caused damage which could be compared to that caused by sodium chloride. An increase in concrete resistance could be obtained by aftertreatment. Neglect of aftertreatment rapidly accelerated weathering of concrete pavements. 22 refs. In German.

**076955 FROSTSCHAE DEN AN BETONFAHRBAHNEN UND KAPPEN. [Deterioration of Concrete Pavements and Overlays in Frost Periods].** The deterioration of concrete pavements by descaling of the surface layer and the mechanism of this phenomenon as a consequence of the effects of de-icing salts are analyzed. Some of the methods which are recommended nowadays to prevent the damage are examined with a view to revealing the chances for their effectiveness. Where they fail, the cause can mostly be attributed to concepts neglecting the importance of an impervious surface, their porosity and capillarity. Recommendations are given on how to treat the pavement surface in order to protect it against the penetration of salt anions efficiently. (Author abstract) In German.

Grunau, Edvard B. *Str Tiefbau* v 41 n 12 Dec 1987 p 15-18.

**076956 ROLLER COMPACTED CONCRETE PAVEMENTS.** Roller compacted concrete for pavements is made by mixing crushed aggregate with cement and water in a pugmill. More cement is used than for cement-treated base (CTB) or soil cement. The cement-plus-pozzolan content ranges from 400 to 700 pounds per cubic yard and just enough water is added to produce a moist earth consistency. High density is essential to develop adequate flexural strength. Tamping bars and a vibrating screed on the laydown machine provide initial compaction. Rollers further compact the pavement to its required density. 4 refs.

**076957 STRESS CAUSED BY TEMPERATURE GRADIENT IN PORTLAND CEMENT CONCRETE PAVEMENTS.** Concern has been expressed in Florida that, because of a nonlinear temperature gradient in a portland cement concrete (PCC) pavement, internal stresses could be developed such that the life of the pavement would be seriously reduced. A research program was undertaken by the Florida Department of Transportation to determine the actual temperature gradient in a PCC pavement. For a period of 9 months, hourly temperatures were recorded from a 9-in.-thick test pavement in Gainesville, Florida. The temperature data were analyzed to determine what curve best fit the data and what were the actual maximum compressive and tensile stresses caused by the nonlinearity of the temperature gradient. These results were compared with those obtained from the AASHTO Test Road and with Bergstrom's prediction method. The results indicated that the nonlinearity of the temperature gradient in a PCC pavement did not have a significant impact on its performance. (Author abstract) 3 refs.

**076959 EFFECT OF RAINFALL ON THE PERFORMANCE OF CONTINUOUSLY REINFORCED CONCRETE PAVEMENTS IN TEXAS.** This study indicated that the initial performance of pavements located in different rainfall areas is practically the same. However, when the pavement starts developing failures (punchouts and patches), the average rate of failures per mile (RPPM) is affected by the average rainfall of the area. Pavements located in 10-in. rainfall areas generally showed an almost zero rate of failure development, whereas pavements located in 52-in. rainfall areas developed failures at a rate of about one failure per mile per year. (Edited author abstract) 6 refs.

**076960 DEVELOPMENT OF A DEMONSTRATION PROTOTYPE EXPERT SYSTEM FOR CONCRETE PAVEMENT EVALUATION.** A computerized system has been developed to assist state highway engineers in evaluating concrete highway pavements. The system uses information collected by the engineer to determine what mechanisms have caused the distresses present in the pavement, so that the rehabilitation techniques that would be most effective in repairing the distresses and preventing their recurrence can be identified. The evaluation procedure has been developed in the form of an expert system that simulates a consultation between the engineer and an expert in concrete pavement evaluation and rehabilitation. The system operates on an IBM-compatible personal computer. The steps in the development of the expert system are described for the benefit of those interested in improved pavement evaluation procedures and in exploring expert systems applications in pavement design, evaluation, and rehabilitation. (Edited author abstract) 5 refs.

**076961 LIMESTONE CRUSHER-RUN AND TAILINGS IN COMPACTION CONCRETE FOR PAVEMENT APPLICATIONS.** Laboratory experiments indicate that both limestone crusher-run and finely grained limestone tailings (by-products of the aggregate mining industry) can be used in concrete made with an emerging technology for flatwork construction known as roller compacted concrete (RCC). This paper reports on tests of laboratory specimens using various combinations of mix components and proportions. The unit cost of concrete progressively decreases as the graded coarse aggregate is substituted with the crusher-run and as the tailings are added. On the other hand, the compressive strength of mixtures including the crusher-run is better than that of graded coarse aggregate and is further improved by the addition of tailings. (Author abstract) 13 refs.

Nanni, Antonio. *ACI Mater J* v 85 n 3 May-Jun 1988 p 158-163.

**076962 DESIGN OF PRESTRESSED CONCRETE PAVEMENTS.** There are no standards or recommended procedures for the design of prestressed concrete pavements; thus design of this type of pavement present unique opportunities and challenges. It also presents a great opportunity to use fundamentally based engineering design methodology rather than the relatively common empirical methods. It is to be anticipated that, as lifecycle costs assume greater importance in the selection of paving solutions, the structural durability of prestressed concrete pavements will make them a competitive alternative, particularly if operational delay caused by maintenance work is a major factor. This paper presents a synthesis of technology appropriate to the design of prestressed concrete pavements. All features of the design calculation are considered, from defining the loading conditions through calculation of both wheel load stresses and those caused by environmental factors, to selection of appropriate limiting stresses for the concrete. Since design is a creative procedure, and designers should be free to use their creative talents to the full, where appropriate, alternative procedures have been described leaving individuals to select the method most appropriate to their needs. (Author abstract) 38 refs.

Stock, A.F. *Struct Eng Part A* v 66 n 11 Jun 7 1988 p 169-175.

**076963 DECORATIVE CONCRETE BLOCK PAVEMENTS.** Engineers today generally utilize Portland cement concrete and bituminous concrete to construct streets. However, an aesthetically pleasing alternative, brick pavers, does exist. Michigan Avenue in Lansing, Michigan, was perceived to need something other than is 'standard' street surface, and concrete stone pavers were selected. It was felt that such a surface was aesthetically pleasing and would establish the needs of pedestrians. Brick surfaces would be a vital part of this emphasized and variations in color, pattern, and texture would play a key role in the design. The final product is an aesthetically pleasing yet a key role in the design. The final product is an aesthetically pleasing yet structurally sound street and is resistant to freeze-thaw actions. Cost of the pavement system was \$6.20/sq ft (\$66.74/m<sup>2</sup>) compared to \$3.14-\$3.54/sq ft (33.80-38.11/m<sup>2</sup>) for more traditional streets built by the city. (Edited author abstract)

Randolph, Dennis A. (City of Lansing, Lansing, MI, USA); Rajendra, Kunwar; Starr, David W. *J Transp Eng* v 114 n 4 Jul 1988 p 409-419.

**076964 REVIEW OF THE DESIGN METHODS FOR CONCRETE PAVEMENTS.** Road pavements are broadly divided into two categories; flexible pavements and rigid pavements. Flexible pavements are constructed with a thin wearing course overlaying the base course. Between the base course and the compacted sub-grade is a sub-base. The load carrying characteristics of a flexible pavement is due to the load-distributing effects of the layered system. As a result of this building up of the thick layers, the applied wheel loads are mainly distributed over the sub-grade with a small amount of the load being supported by the bending action of the bound materials.

In the rigid pavement, the wearing course is a concrete slab overlaying the sub-grade, between which there may or may not be a base course. The load is distributed over a wide area of sub-base, with the concrete slab carrying a major portion of the load in bending. Consequently a major design consideration is the structural strength of the concrete with small variations of the sub-grade not really having significant effects on the structural capacity of the slab. Discussed are rigid pavement analysis, UK standards, and UK design methods. 10 refs.

Bull, John W. (Univ of Newcastle-upon-Tyne, Engl). *Highways (Croydon Engl)* v 56 n 1936 Apr 1988 p 25-26.

**076965 LOCATION OF DOWEL BARS IN CONCRETE PAVEMENTS.** Dowel bars are the most effective means of providing load transfer across movement joints in concrete pavements. In order for the joints to function correctly it is essential that the bars are aligned parallel to each other within suitable tolerances. The problem facing the engineer is the difficulty of establishing that these tolerances have been met. The need for a non-destructive method of inspection and measurement of dowel bar alignment is widely recognised and one which TRRL is endeavouring to meet by the development of a magnetically based device designed specifically for use on road joints. The project is supported by a research contract to the Cranfield School of Industrial Science which has designed and constructed the system in conjunction with the Technical Services Unit of TRRL.

**076966 RECOMMENDATIONS FOR DESIGNING PRESTRESSED CONCRETE PAVEMENTS.** Given adequate consideration to the design of joints and the placement of reinforcement, long prestressed slabs with substantially smaller thicknesses than those of conventionally reinforced pavements carrying the same loads can be constructed practically without cracks. Also, by capitalizing on the favorable distribution of the stresses caused by the effect of the difference in the moisture content from top to bottom across the thickness of the slab, the amount of prestressing forces required, and thus the prestressing reinforcement, may be reduced. This report analyzes the factors influencing the design of prestressed concrete pavements and recommends methods for their layout and structural analysis. (Edited author abstract). 42 Refs.

Anon (ACI Committee 325). *ACI Struct J* v 85 n 4 Jul-Aug 1988 p 451-471.

**076967 HOW TO BUILD CONCRETE PARKING LOTS.** To encourage good construction of concrete parking lots, the American Concrete Institute (ACI) formed Committee 330, Parking Lots, in 1982. In December 1987, the committee's first document, ACI 330R-87, "Guide for Design and Construction of Concrete Parking Lots," was published for use and public comment. The guide summarizes accepted practices for designing and constructing many categories of concrete parking lots. This article offers a brief review of the highlight of the guide.

**076968 PREDICTING PLASTIC SHRINKAGE CRACKING LMC OVERLAYS.** Plastic shrinkage cracking is a potential problem when latex-modified concrete (LMC) is placed on a dry, windy day. LMC has a lower water content than conventional concrete so it bleeds less. Because plastic cracking is caused by evaporation rate exceeding bleeding rate, LMC's low bleeding rate makes plastic cracking more likely. To avoid the problem, contractors must be able to predict when it's likely to occur so they can take steps to prevent it. Whenever

temperature, relative humidity, and wind conditions are such that evaporation rate exceeds the critical 0.1 value, contractors should be especially careful. 4 Refs.

Sprinkel, Michael M. (Virginia Transportation Research Council, Charlottesville, VA, USA). *Concr Constr* v 33 n 7 Jul 1988 p 672-674.

**076969 VERKEHRSFLACHEN AUS BETONPFLASTERSTEINEN PLANUNG UND GESTALTUNG.** [Concrete Block Pavements Design and Layout]. The concrete paving block has in the past opened up a wide range of application. Pedestrian precincts, traffic-restricted zones, housing estate roads, footways, cycle tracks, cross-country paths, farm tracks, bus stop bays, parking and industrial areas, but also private garden paths, terraces, yards and access ways, are increasingly being paved with concrete blocks. This steady increase in interest in this type of paving is undoubtedly due to its advantageous properties. Carefully designed and expertly constructed pavements consisting of concrete blocks fulfil high demands as to appearance, functional performance, durability and economy. (Edited author abstract). 11 Refs.

Kampen, R. *Betonwerk Fertigteil Tech* v 54 n 5 May 1988 p 32-38.

**076970 VERKEHRSFLACHEN AUS BETONPFLASTERSTEINEN PLANUNG UND AUSFÜHRUNG.** [Concrete Block Pavements Design and Construction]. Pavements constructed of precast concrete blocks or flagstones are one of the most important types of trafficable public area. With these elements it is possible to build paved surfaces that fully satisfy the needs of towns and rural localities. A number of technical problems are associated with the construction of such pavements: earthworks, drainage, joint sealing, etc. Some information on these matters will be given in this article, with particular reference to the relevant regulations, directives and codes of practice. (Author abstract). 4 Refs.

Mortiz, Helmut. *Betonwerk Fertigteil Tech* v 54 n 5 May 1988 p 40-42,44-48.

**076971 BETONPFLASTERSTEINE - RICHTIG EINGESETZT.** [Concrete Paving Blocks - Properly Used]. Between 70 and 80 million square metres of concrete block paving are laid in the Federal Republic of Germany each year. The principal applications are in residential roads, pedestrian precincts and frontage roads; also industrial yards, car parks, and paved areas in parks and gardens. The commercially available range of concrete paving blocks should be scrutinized by the pavings designer with regard to suitability of the products for his particular purpose. Numerous aspects of design and layout have to be considered, but also the interests of the civil engineer, the road user and the road maintenance authorities. Suggestions are made with regard to the assessment of coloured blocks and the occurrence of efflorescence. Finally, some tips relating to correct laying of the blocks, to avoiding mistakes and to the final vibratory compaction of the paving are given and explained. (Author abstract).

Pesch, Lothar. *Betonwerk Fertigteil Tech* v 54 n 5 May 1988 p 50-56,58-59.

**076972 PRECAST CONCRETE PAVING.** Paving blocks lock together to form a membrane or continuous layer, capable of distributing loads applied at the pavement surface to the underlying layers. Before any design can be started it is necessary to have, at least, the following information: 1. Traffic flow at the time of opening; 2. Prediction of any changes in future traffic flows; 3. Design life in terms of either years or traffic flow; 4. Subgrade bearing strength and 5. Location of the water-table. There is no doubt that flags and blocks provide attractive, long lasting, easily maintainable and competitive surfacings for a wide range of applications. Existing block paving design methods are safe, as long as the correct materials are used in the layer immediately beneath the laying course. More sophisticated design methods are possible that may further reduce the overall cost of block paving. The

introduction of the smaller flag sizes and the laying of these on a thin sand bedding has done much to improve the performance of flagged surfaces and simplified construction. 22 Refs.

Lilley, Alan. *Highw Transp* v 35 n 7 Jul 1988 p 18-20,22-25.

**076973 RECYCLING DETROIT'S LODGE FREEWAY.** The scarcity of quality natural aggregates in many locations, and the growing lack of suitable disposal sites for old material, especially in urban areas, make pavement recycling both economically and environmentally desirable. Recycling of the old reinforced concrete pavement provided more than enough coarse aggregate for the new concrete placed during reconstruction of 8.7 miles (14 km) of Detroit's John C. Lodge Freeway in 1987, described in this article. 2.

Pearson, Robert I. (Concrete Int, Detroit, MI, USA). *Concr Int* v 10 n 8 Aug 1988 p 17-19.

**076974 NO-FINES PERVIOUS CONCRETE FOR PAVING.** Results of a laboratory study of no-fines pervious concrete for paving are presented. Conclusions are drawn regarding the percent air voids needed for adequate permeability, the optimum water-cement ratio range, and the amounts of compaction and curing required. Recommendations are made regarding appropriate uses for this type of concrete. (Author abstract).

Meininger, Richard C. *Concr Int* v 10 n 8 Aug 1988 p 20-27.

**076975 FAST-TRACK CONCRETE PAVING.** Fast-track concrete has been successfully used for new paving and both bonded and unbonded overlays. Its ability to carry heavy traffic within 12 hours of placement has been clearly demonstrated, and an 8-hour pavement is a feasible goal. Mixing and placing is possible using conventional mixing plant and pavers, but new equipment is needed to enable full advantage to be taken of the fast-track technique. Fast-track concrete sets up very quickly, so mixing plant must be located close to the site. Mixes that set and gain strength even faster than those currently in use could be utilized if equipment were available that could mix the concrete immediately in front of the paver. Adjustable-width zero-clearance pavers would make it easier to apply fast-track paving within the tight constraints of urban road systems; improved vibration capability would make it easier for pavers to handle this extremely stiff concrete. New admixtures and cements may be helpful in controlling set and workability while still producing the required strengths.

Pearson, Robert I. (Concrete Int, Detroit, MI, USA). *Concr Int* v 10 n 8 Aug 1988 p 33-35.

**076976 TEXTURING CONCRETE PAVEMENTS.** Increased traffic volumes and speeds have increased the need for an improved skid-resistant surface. The emphasis has been to improve skid resistance by creating new surface textures that increase the 'macrotexture' of the concrete pavement. These textures are created by forming the deeper textures in the plastic concrete during the finishing operations or by sawing grooves in the hardened concrete of existing pavements with cutting heads composed of a number of circular diamond saw blades. (Author abstract).

Anon. *Concr Int* v 10 n 8 Aug 1988 p 50-52.

**076977 EXPERT SYSTEM TO EVALUATE CONCRETE PAVEMENTS.** 'Pavement Expert' is an expert system developed to aid in the evaluation of concrete pavements. The system is operational on an IBM microcomputer. 'Pavement Expert' operates in two modes: dialogue and data logging modes. The dialogue mode is controlled by a Savoir shell which controls the dialogue between the user and the system. The system makes decisions 'intelligently' concerning the length of the section to evaluate, extent and severity of the observed distresses, and calculates and store the final indices. The data logging mode acts as an intelligent data logger recording specific observed distresses. The system consists

of five stages ranging from identifying the road to providing a full report on the general condition of the pavement. (Edited author abstract). 4 Refs.

**076978 SKIDDING RESISTANCE OF CONCRETE: PERFORMANCE OF LIMESTONE AGGREGATE EXPERIMENT AFTER 10 YEARS.** A full-scale experiment was constructed on the Windover to Funtley section of M27 and opened to traffic in 1976. The experiment comprised twelve sections, each 150 m long, containing a variety of concretes chosen to study the effect of using a range of qualities of limestone coarse aggregate and of using different proportions of limestones or shell in the fine aggregate. Measurements of Sideway Force Coefficient have been made annually for 10 years. The factor having the most effect on skid resistance was the acid-soluble content of the fine aggregate. Results of the Polished Mortar Value test correlated with both the acid-soluble content and the Sideway Force Coefficient on two of the three lanes but were relatively insensitive to changes in material quality. The Polished Stone Value of the coarse aggregate was a significant factor but, its effect on skid resistance was limited. (Edited author abstract). 7 Refs.

Franklin, R.E. *Res Rep Transp Road Res Lab* n 144 1988 var paging.

**076979 FUNDAMENTAL EXPERIMENT ON THE ENGINEERING PROPERTIES OF CEMENT MIX MATERIALS FOR BASE COURSE.** This paper presents a comprehensive study to investigate compaction-strength mechanism as well as drying shrinkage characteristics on cement mix materials for base course with water content from low water content region which is suitable for roller-compaction to high water content region which is suitable for vibration-compaction. From the experiment results, dry density changes continuously with respect to water content of both regions and is maximum at the boundary. But at that boundary, compressive strength is different and discontinuous. In other words, compressive strength is not always governed by dry density and is found to be governed by cement-paste/-void ratio. The drying shrinkage of these materials is linearly proportional to water content and cement content during mixing. (Author abstract). 8 Refs.

## Concrete Construction

**076980 REPORT AND REVIEW OF A MAJOR SLABJACKING CASE HISTORY.** A review is presented of a major case history of lifting and leveling portland cement concrete highway slabs by injection of a fluid cement/pozzolan material between the subgrade and the slab. The paper includes history and background data as well as current practices, advantages, disadvantages, and specific procedures. Grout materials, mixtures, equipment, and lifting controls are discussed. (Author abstract) 2 refs.

Bandimere, Samson W. (Denver Grouting Services, Broomfield, CO, USA). *Transp Res Rec* 1104 1986 p 3-6.

**076981 CONCRETE SLABS AND BLOCKS FOR CAR PARK PAVING.** In addition to its primary function of providing a stable and durable surface for vehicular movement, the parking area pavement must also allow sufficient open spaces for turfing and tree planting. A pavement system consisting of discrete precast perforated-concrete-slab units was found to offer a reasonably satisfactory solution. Later, two new forms of parking area construction, namely, the interlocking-perforated-concrete-block pavement and the cast-in-situ jointed-perforated-concrete-slab pavement. Although both innovations have led to higher construction costs, their

superior structural stability and lower maintenance requirements may justify their use on the basis of life-cycle cost considerations. 5 Refs.

**Construction** See Also ROADBUILDING MATERIALS—Standards.

**076982 CONSTRUCTION OF RUBBER-MODIFIED ASPHALT PAVEMENTS.** Public road agencies are currently evaluating hot mix applications of Plus Ride and Arm-R-Shield modified asphalt pavements. The processes use reclaimed rubber from ground automotive and light truck tires to reduce reflective and thermal cracking, suppress traffic noise, increase resistance to studded tire wear, and reduce the environmental impact of tire disposal. The projects constructed to date have primarily been experimental because the capital cost for this surfacing alternative ranges from 1.5 to 2 or more times the cost of conventional asphaltic concrete. A literature review of the construction practices and a questionnaire survey of contractors are used to determine why the construction costs of the modified mixes have been so high. Study results are discussed. 24 refs.

**076983 BETTUNG VON GEHWEPLATTEN-BELAEGEN.** [Bedding of Sidewalk Slab Pavements]. The technique of bedding sidewalk plates had been treated in number 3/1982 of this magazine already. To find out about the best material for bedding, tests were made with three different compositions: trass-lime LP, bituminous mortar, and crushed basalt. All of these materials showed good performance but the third option seems outstanding in some respects. These are: simplicity of application, cost-efficiency, and ease of mending operations. This evaluation is not regarded as final since the test time seems not long enough for a definite assessment, but it is meant as an intermediate report on an on-going test. (Edited author abstract) 2 refs. In German.

Eickmann, Hans-Martin. *Str Tiefbau* v 41 n 1 Jan 1987 p 15-16.

**076984 HOW TO USE AND INSTALL CONCRETE BLOCK PAVERS.** Colored concrete paving stones have become increasingly popular for applications ranging from light-use pedestrian walkways and patios, sidewalks and plazas in downtown renewal projects, to the heaviest industrial uses. The complete concrete masonry pavement has five key elements, each of which is discussed in detail. They are: Subgrade, the natural earth material found on the site; the subbase, which is introduced, leveled, and compacted; the edge restraints, which are used around the perimeter of the pavement; the placing and level screeding of the bedding sand; and the concrete paver surface, which is both the attractive wearing surface and the load-distribution system. The article discusses the details on each step in the procedure.

Croushore, Paul N. (Mobay Chemical Corp, Pittsburgh, PA, USA). *Public Works* v 119 n 7 Jun 1988 p 87-89.

**076985 SPECIFICATIONS FOR QUALITY CONTROL: A CASE STUDY.** Specifications that call for unnecessary perfection through so-called 'hard' or 'tight' requirements are hardly reasonable; furthermore, they do not assure performance. Specifications that attempt to control quality through extremely limited tolerances may in fact be counterproductive. When quality control efforts are directed to compliance with the letter of such specifications, quality may be compromised, contract administration may be difficult, and additional costs may be incurred, all without improving performance of the completed work. A case study of a small paving project is presented to illustrate the problems created by a too-restrictive specification. Alternatives and comments to improve the specification are offered. (Edited author abstract) 1 ref.

Gentry, Claude (Byrd, Tallamy, MacDonald, and Lewis, Falls Church, VA, USA); Yrjanson, William A. *Transp Res Rec* n 1126 1987. Publ by ISA, Washington, DC, USA, 1987 p 37-41.

## Costs

**076986 ECONOMIC ANALYSIS OF RUBBER-MODIFIED ASPHALT MIXES.** The Alaska Department of Transportation and Public Facilities (ADOTPF) is presently evaluating the use of recycled rubber in hot mix pavement applications. The benefits of adding rubber to the mix include increased skid resistance under icy conditions, improved flexibility and crack resistance, elimination of a solid waste, and reduced traffic noise. The major disadvantage of these rubber-modified mixes is their high cost in relation to conventional asphaltic concrete pavements. A comparison of the economics of the rubber-modified system with that of the conventional pavement shows that the rubber-modified surfacing is cost-effective. This conclusion is based on an analysis of life-cycle costs. (Edited author abstract) 9 refs.

## Crack Propagation

**076987 M4 MOTORWAY, A COMPOSITE PAVEMENT. SURFACE CRACKING.** The London-South Wales motorway, M4, was built during 1970/71, in a series of six contracts. In 1981, when the motorway had carried about half its design load, a structural condition survey was set up to assess its condition and plan maintenance. At that time very little maintenance had been carried out to obscure the signs of deterioration, and the strongly characteristic patterns of cracking and rutting on each contract resulting from the use of different aggregates and construction plant by each contractor offered the opportunity to study the processes of decay in a composite pavement. The variety of forces acting simultaneously to influence the rate and frequency of crack formation and subsequent deterioration makes analysis difficult, but identification of the factors described may add to understanding composite pavement decay. The study illustrates the advantage of lean concrete of high strength, with longitudinal joints located generally along the lane lines, and it demonstrates the benefit of wearing course asphalt of high flexibility and resilience. 1 ref.

Burt, A.R. (Berkshire County Council, Engl). *Highway Transp* v 34 n 12 Dec 1987 p 16-19.

## Cracking

**076988 BEHAVIOR AND DESIGN OF VERTICAL MOISTURE BARRIERS.** Seasonal wetting and drying affect pavements on expansive soils with two main damage types: roughness development and longitudinal cracking. The purpose of the moisture barrier is to isolate the subsoil from these climatic changes. The predominate type of damage and the function of the barrier are dominant type of damage and the function of the barrier are found to depend on the initial moisture conditions of the subsoil. For desiccated soils, the barrier must prevent the infiltration of rainfall into the shrinkage cracks to stop the development of roughness. For wet soils, the barrier must prevent excessive drying under the edge of the pavement. The barrier depth is chosen based on the maximum crack depth and the shrinkage of the pavement edge that would occur under the most severe drought intensity expected during the lifetime of the pavement. The drought intensity is chosen based on a statistical analysis of meteorological data for the site. (Edited author abstract) 30 Refs.

## Creep

**076989 CANIK UL - A NEW CREEP TESTING MACHINE.** Highway engineers are very much concerned with the prediction of performance of bituminous surfaced roads. This is done by measuring permanent deformation in a laboratory and applying the data to simple deformation models for the prediction of rutting. A model which has gained much favour is the one proposed by Hills which is based on a creep test carried out applying a static uniaxial load to a specimen maintained at constant temperature and monitoring the deformation-time relation. The good correlation found between creep test and rutting led many research laboratories to use the creep test not only to characterise the mixtures in terms of their deformation properties but also to estimate the rut depth. 11 refs.

Cabrera, Joe G. (Univ of Leeds, Engl); Nikolaides, Athanasios F. *Highway Transp* v 34 n 11 Nov 1987 p 33-36.

## Deformation

**076990 DEFLEXION DES CHAUSSEES ET BI-LAN HYDRIQUE.** [Pavement Deflection and Rainfall Balance]. Systematic monthly measurements of the deflection of sections of pavements, mostly of the traditional type, were begun in 1977 in the six Regional Laboratories which constitute the base of overlay operations. These measurements were accompanied by the calculation of the rainfall balance affecting the ground, on the basis of data gathered by the nearest meteorological station, as is done for agricultural purposes. The object of the study was to observe seasonal variations of deflection and compare them with seasonal variations of the rainfall balance. Examination of the numerous results gathered indeed reveals an analogy in the variation of these two factors, but with a variable shift between the curves representing them. It seems that this shift, and also the more or less 'typical' nature of the curves of evolution of deflection, depends among other things on the geotechnic and hydraulic characteristics of the site under observation. Consideration of meteorological factors alone would therefore seem to be insufficient to predict the way the deflection varies. (Author abstract) 3 refs. In French.

**076992 CHARACTERIZATION OF THE METEOROLOGICAL DEMAND FOR THE DESIGN OF VERTICAL MOISTURE BARRIERS.** Pavements founded on expansive soils are damaged because of seasonal wetting and drying of the foundation soils. The magnitude of the damage is controlled by the wettest and driest moisture content profiles that occur at the site. The moisture profiles are altered with the removal or replenishment of soil moisture by the meteorological conditions. Because weather conditions cannot be predicted accurately, the extreme moisture content profiles are stochastic. The purpose of this study is to characterize the wettest and driest moisture content profiles that have the desired probability of occurrence during the lifetime of the

pavement. The wettest and driest profiles are associated with the respective annual maximum and minimum depths of water stored in the soil profile. 31 Refs.

**076993 BLACK-TOP MAINTENANCE: HORSES FOR COURSES.** Value for money in maintenance of bituminous surfaces and flexible foundations, no less than for any other engineering function requires strict observance of the much publicised 3-Es (Economy, Efficiency and Effectiveness). Cost effective maintenance is achievable in three distinct, but interrelated phases: (1) Identification and assessment of the early stages of deterioration and any apparent contributory factors. (2) Selection of a maintenance treatment appropriate to severity of defect and underlying causes. (3) Specification, execution and quality control of repair and/or maintenance treatment. 6 refs.

Olesen, R.W. *Highw Transp* v 34 n 7 Jul 1987 p 21-23, 26-27, 29-31.

**076994 FACTOR ANALYSIS OF PAVEMENT DISTRESSES FOR SURFACE CONDITION PREDICTIONS.** Pavement distress information is needed to assess maintenance requirements and to plan rehabilitation. For immediate maintenance requirements, it is necessary that the details of individual distress types, severity, and density be known. However, for pavement design and long-range rehabilitation planning, more approximate and aggregated data are sufficient. Furthermore, due to correlation between individual distresses, it is only practical to predict aggregated rather than individual detailed distresses. In this paper, the distress types are aggregated into five fundamental uncorrelated categories (factors) using factor analysis techniques. The five factors are thermal cracking, edge cracking, surface instability, fatigue cracking, and random cracking. (Edited author abstract) 14 refs.

**076995 DEVELOPMENT OF SPRING LOAD RESTRICTIONS FOR LOCAL ROADS.** Load restrictions to reduce or preclude pavement damage during spring thaw periods are widely used in the United States and Europe. Load restrictions are primarily applied to low-volume road networks. In recent years extensive examinations of load restriction-related issues have been conducted in states such as Alaska, Minnesota, and Washington. The development of guidelines for use in determining where to apply the load restrictions and their magnitude is reported in this paper. A survey of current practice in the United States and Canada revealed that load restrictions are applied mostly to pavements that have subgrades composed of moisture-susceptible silts and clays. It also revealed that the restrictions are mostly applied to aggregate and asphalt-surfaced pavements. The maximum legal loads are generally reduced about 40 to 50 percent for single axles and 30 to 50 percent for tandem axles during the spring thaw period. (Edited author abstract). 15 Refs.

**076996 NONDESTRUCTIVELY DELINEATING CHANGES IN MODULUS PROFILES OF SECONDARY ROADS.** To load-zone roads properly, mechanisms involved in the deterioration of pavements must be understood and monitored. The state of practice in nondestructively evaluating pavement systems is limited to determining changes in modulus profiles. For secondary roads, deflection basin methods [such as falling-weight deflectometer (FWD) and Dynaflect] are most effective in determining moduli of subgrades and are not as sensitive

to moduli of the surface and base layers. On the other hand, the Spectral-Analysis-of-Surface Waves (SASW) method is quite sensitive to moduli in the upper layers. In addition, the SASW method has the advantage of allowing the pavement system to be divided into numerous layers, say 10 to 15 in the upper 3 ft, so that detailed profiles can be determined. With this resolution, it is possible to delineate changes in the modulus profile from one measurement to the next. (Edited author abstract). 10 Refs.

**076997 MINIATURE SUBGRADE IMPACT TESTER: AN ALTERNATIVE TO CBR TEST.** The California Bearing Ratio (CBR) is a commonly used test to determine the load-penetration characteristics of the soil. The design of flexible pavements is mostly guided by the criterion of CBR tests conducted mostly in the laboratory on soil samples. The in-situ field CBR tests conducted on natural subgrade can provide a relatively more reliable picture of the load-penetration characteristics of soil. In this paper, a simple and an economical alternative, viz., the miniature sub-grade impact tester is discussed together with related correlations established for the purpose of flexible pavement design. 7 refs.

**076998 ALTERNATIVE SOLUTION CHARTS FOR AASHTO PAVEMENT DESIGN GUIDE.** In July 1986 the American Association of State Highway and Transportation Officials (AASHTO) published a revision to its long-standing pavement design method under the title AASHTO Guide for the Design of Pavement Structures (AASHTO 1986). The revised guide retains the basic algorithms for flexible and rigid pavement design that were developed from the data of the AASHTO road test. The purpose of this note is to offer alternative design charts for the solution of the guide equations. It is recognized that with the use of the electronic calculator and the desk-top microcomputer not many engineers will ever use the solution nomographs presented in the guide. For those who must use the nomographs or would like quick graphical solutions for estimation purposes, the following design charts should be easier to use than the nomographs presented in the guide. 2 refs.

Guell, David L. (Univ of Missouri-Columbia, Columbia, MO, USA). *J Transp Eng* v 114 n 2 Mar 1988 p 239-244.

**076999 FLEXIBLE PAVEMENT DESIGN - THE FRENCH PRACTICE.** This paper is an attempt to summarise the flexible pavement design approach as practised in France, based on the material gathered and the discussions conducted by the author while he was on a study tour of France. In order to cater for a very heavy traffic, modern day conditions and redesigning for an axle load of 130 kN (instead of 80 kN according to British design), it became necessary to strengthen the roads in France. Techniques were therefore developed to be economical and yet practical. This is to a greater part achieved by using the industrial byproduct fly ash as a hydraulic binder to stabilise road courses. 13 refs.

Ramaswamy (Natl Univ of Singapore, Singapore). *Highw Transp* v 35 n 1 Jan 1988 p 26-29.

**077000 THICKNESS DESIGN OF ROLLER-COMPACTED CONCRETE PAVEMENTS.** Roller-compacted concrete (RCC) is a relatively stiff or zero-slump concrete mixture that is compacted by vibratory roller. RCC is capable of providing concrete with relatively high in-place strength, and its engineering behavior is similar to that of conventional concrete. RCC is being used as a paving material at off-highway facilities such as container ports, intermodal yards, log-sorting yards, truckparking

areas, and tank aprons (hardstands). A procedure for thickness design of RCC pavements is presented in this paper. The design approach used for RCC pavements is similar to the procedure used by the Portland Cement Association for design of concrete airfield and heavy industrial pavements. The proposed procedure requires computation of allowable pavement stress based on the number of total load applications and computation of expected pavement stress due to the design wheel loading. (Edited author abstract). 4 Refs.

Tayabji, Shiraz, D. (Construction Technology Lab, Skokie, IL, USA); Halpenny, David, J. *Transp Res Rec* n 1136 1987 p 23-32.

**077001 COMBINED EFFECT OF TRAFFIC LOADS AND THERMAL GRADIENTS ON CONCRETE PAVEMENT DESIGN.** The purpose of this work is to study the behavior of concrete pavements under the simultaneous action of traffic and thermal gradients in concrete slabs. A new procedure for the structural design of concrete pavements in Spain is presented. A fatigue equation, taken from an adjustment of Tepfer's fatigue law and based on data on the behavior of several concrete pavements in Spain, is proposed. Analyses of loading stresses, thermal warping stresses, and simultaneous action stresses in slabs resting on a stratified semi-infinite solid were performed using a finite-element computer program. Empirical and theoretical equations for predicting the different values of thermal gradients and the frequency of their occurrence were established; these equations are based on Fourier's law and data obtained from observations in Spain. A computer program was developed to obtain new equivalence factors based on the results of the calculations. (Edited author abstract). 6 Refs.

Faraggi, Victor (Univ of Chile, Santiago, Chile); Jofre, Carlos; Kraemer, Carlos. *Transp Res Rec* n 1136 1987 p 108-118.

**077002 TRENDS IN AXLE LOADING AND THEIR EFFECT ON DESIGN OF ROAD PAVEMENTS.** The results of the continuing program of monitoring using the TRRL weighscale, and the results of static axle weighing surveys, have been used to study trends in axle loading and their effect on the design of road pavements. The results have been analyzed to show how the effect of commercial vehicles has changed with time and how it is related to vehicle type. There is particular emphasis on recent changes in regulations that have allowed higher gross weight vehicles and led to the appearance of considerable numbers of five axle articulated vehicles of 38 ton gvw, and some six axle vehicles. The results of the analysis have been used to provide procedures for the estimation of the effect of commercial vehicles on the design and performance of road pavements for past, present and future years. (Author abstract). 13 Refs.

Robinson, R.G. *TRRL Lab Rep* n 138 1988 var paging.

## Drainage

**077003 ECONOMIC IMPACT OF PAVEMENT SUBSURFACE DRAINAGE.** The relatively recent movement toward subsurface pavement drainage is largely due to the development of improved and economical drainage materials along with greater awareness of the nature and extent of the problem resulting from the research of a number of individuals throughout the world. Among these developments are geotextiles, asphalt-treated permeable materials, concrete pavement edge drains, and others. The article discusses case histories for rigid and flexible pavements, and the economics involved.

Forsyth, Raymond A. (California DOT, Sacramento, CA, USA); Wells, Gordon K.; Woodstorm, James H. *Public Works* v 119 n 1 Jan 1988 p 61-64, 88-89.

**077004 WATER-INDUCED DISTRESS IN FLEXIBLE PAVEMENT IN A WET TROPICAL CLIMATE.** A wet tropical climate characterized by abundance of rainfall and cool nights followed by hot days offers a favorable environment for the development of water-associated distress in flexible pavement. Surface deteriorations such as stripping and raveling have been widely reported and studied in the literature. Other forms of water-induced distress, which are caused by water trapped within the structure system of a flexible pavement, are described in this paper. The occurrence of such distress is difficult to predict, and the subsequent repair is usually quite costly and elaborate. A number of cases of water-induced distress in flexible pavement in Singapore and Malaysia are presented and discussed. The need for drainage analysis in pavement design and the importance of drainage consideration in pavement construction and maintenance are highlighted. On the basis of relevant experience in the region, some preventive measures are recommended for guarding against water-induced problems in flexible pavement. (Author abstract) 5 refs.

Fwa, T.F. (Nat'l Univ of Singapore, Kentridge, Singapore). *Transp Res Rec* 1121 1987 p 57-65.

**077005 ECONOMIC IMPACT OF PAVEMENT SUBSURFACE DRAINAGE.** Much of the water that falls on pavements penetrates the structural section through cracks, joints, and porous surfaces. Conventional slow-draining pavements are deteriorating more rapidly than is necessary because of the impacts of heavy vehicles on flooded structural sections. The most positive pavement drainage systems use an open-graded drainage layer under the full width of a roadbed with adequate collector pipes and outlet pipes. However, the California Department of Transportation has found that retrofit edge drains are greatly reducing the rate of step faulting of existing portland cement concrete pavements. The impact of positive rapid drainage features on the performance of a number of pavements is reviewed, with particular emphasis on the establishment of a cost-benefit relationship. The results of this evaluation indicate that the increased cost of effective pavement drainage is almost incidental to the savings realized through improved performance. (Edited author abstract) 29 refs.

Forsyth, Raymond A. (California DOT, Sacramento, CA, USA); Wells, Gordon K.; Woodstrom, James H. *Transp Res Rec* 1121 1987 p 77-85.

**077006 USE OF OPEN-GRADED, FREE-DRAINING LAYERS IN PAVEMENT SYSTEMS: A NATIONAL SYNTHESIS REPORT.** The effects of excessive and uncontrolled water entrapped in the various components of a paving system are known or suspected to have been responsible for unsatisfactory performance and outright failures of both portland cement concrete and asphaltic concrete pavements. To eliminate or at least reduce the detriment, almost half of the highway and transportation agencies across the nation have been addressing the problem by designing and constructing free-draining pavement systems. In an effort to ascertain just how much and what kind of attention is being given free-draining pavements on a national scale and to gain some insight into the performance characteristics of such systems designed to date, the Transportation Research Board's Committee on Subsurface Drainage prepared a questionnaire for national distribution in the fall of 1985. This paper is an attempt to summarize the responses to that questionnaire. (Author abstract)

**Elasticity** See Also ROADS AND STREETS—Computer Aided Design.

**077007 ANALYSIS OF AXLE LOADS AND AXLE TYPES FOR THE EVALUATION OF LOAD LIMITS ON FLEXIBLE PAVEMENTS.** The Commonwealth of

Pennsylvania is responsible for 44,000 mi of roads, the majority of which have pavements with limited structural capacity. The state has the authority to restrict axle loads on its roads if it is believed that those axle loads would result in excessive damage to the pavement structure. Consequently, a procedure for establishing axle load restrictions is necessary. As part of the development of a framework for load limit analysis, an evaluation was made of the sensitivity of pavement response and predicted performance to variations in loads, layer moduli, and layer thicknesses. To evaluate the effect of axle loads under a variety of conditions, a theoretical elastic layer analysis was conducted that considered various load magnitudes and configurations for different pavement thicknesses and material properties. (Edited author abstract) 9 Refs.

**077008 RELIABILITY OF THE FLEXIBLE PAVEMENT DESIGN MODEL.** The design of flexible pavements by the U.S. Army Corps of Engineers is currently based on the California bearing ratio (CBR) curve. The CBR curve is empirical, and the current design approach is deterministic. A probabilistic approach, providing more reliable designs at potentially lower costs, can be developed from the current design procedure if the reliability of the CBR curve is known. This study was undertaken to establish the reliability of the current CBR-based flexible pavement design model using existing data from accelerated traffic tests. The reliability of the design model was found to be about 50 percent, excluding the effects of conservative estimates of the design parameters. (Author abstract) 16 Refs.

**077009 ERFASSEN UND BEWERTEN DES ZUSTANDES VON STRASSENBEFESTIGUNGEN.** [Recording and Evaluating the Condition of Pavements]. A method of systematic inspection of road pavement surfaces, recording in detail their condition and making evaluations of the general conditions of road stretches is presented. The use of computers and data processing offers possibilities for an advantageous utilization of the acquired information. The state of a road pavement is characterized by its safety value, substance value, and gripping factor. Various representations of the evaluation of pavement conditions are illustrated. This leads to a classification of conditions, degrees of urgency of repair, and priority planning. The effect of rehabilitation measures can be checked with the data available. The costs of maintaining these inspectional records amount to about 0.7 to 1.5% of the total pavement maintenance costs. (Edited author abstract) In German. 14 refs.

**077010 DEVELOPMENT OF A DISTRESS INDEX AND REHABILITATION CRITERIA FOR CONTINUOUSLY REINFORCED CONCRETE PAVEMENTS USING DISCRIMINANT ANALYSIS.** Discriminant analysis is applied to developing the distress index and rehabilitation criteria of the network-level pavement management system for continuously reinforced concrete pavements in Texas. The results are intended to provide the Texas State Department of Highways and Public Transportation with guidelines for evaluating the present pavement conditions and for scheduling rehabilitation. For the discriminant analysis, historical condition survey data were evaluated and separated into two groups, overlaid and nonoverlaid pavements, for which detailed descriptions were given. Each set of data comprised several distress manifestations. (Edited author abstract) 10 refs.

Chou, Chia-Pei (Univ of Texas at Austin, Austin, TX, USA); McCullough, B. Frank. *Transp Res Rec* 1117 1987 p 76-82.

**077011 SUCCESSIVE FUZZIFICATION TECHNIQUE AND ITS APPLICATION TO PAVEMENT EVALUATION.** A successive fuzzification procedure has been developed by extending the 'fuzzifier' concept introduced by Zadeh. This technique provides an efficient fuzzification procedure for cases where an entity is influenced by human and system uncertainty originating from different sources. In such cases, each source of uncertainty is given an individual fuzzifier, and a composite fuzzifier is created for the entity from the individual ones. A specific application is cited in the area of transportation engineering where the technique has been used to improve pavement distress surveys. (Edited author abstract) 5 Refs.

## Failure

**077012 AUTOMATED ACQUISITION OF TRUCK TIRE PRESSURE DATA.** The results of a study into the feasibility of automatically monitoring the contact tire pressures produced by trucks while they are in motion by monitoring tire footprint dimensions and weight are presented. The work undertaken includes a review of principles of tire contact pressure measurement and available sensor technology; an assessment of the feasibility for using each principle/technology for truck contact pressure measurement; and development of the concept for an independent tire contact pressure measurement system. The results of work performed by the Texas Transportation Institute are presented. (Edited author abstract) 1 ref.

## Fatigue

**077013 DEVELOPMENT OF DYNAMIC FATIGUE FAILURE CRITERION.** When a truck wheel moves on the road, stress pulses develop within the pavement layers. These pulses are primarily functions of load magnitude, tire pressure, and vehicle speed. In this study, dynamic analysis is used to predict stresses and deflections that develop when a moving wheel load is applied. The method considers the inertial forces and assumes pulsating loads that accurately simulate actual wheel loading. The method is applied on AASHTO road test sections to predict their theoretical response. The change of stresses and deflections at various loading times at different speeds is computed and verified versus actual field data. The evaluated pavement response is used to develop a fatigue failure criterion for a speed of 30 mph, which is the mean speed at the AASHTO road test. (Edited author abstract) 19 refs.

## Foundations

**077014 KENT DESIGNS SLAG-BOUND ROAD-BASE INTO BYPASS SCHEME.** From a technical point of view phosphoric slag cannot be far short of being the ideal roadbase material. Heading the list of merits is an impressive £4/m<sup>2</sup> saving over conventional bituminous roadbase construction. The material is a blend of 85% phosphorous slag and 15% granulated blast furnace slag. The hydraulic or cementitious nature of granulated blast furnace slag slowly imparts a stiffness, strength and, therefore, performance, to the material that is akin to lean concrete roadbase.

**077015 FACILITE ET QUALITE DE L'ENTRETIEN LOCALISE DES CHAUSSEES - BETON BITUMINEUX COULE AU SOUFRE.** [Facility and Quality of Local Maintenance of Pavements; Sulfur-Extended Bituminous Concrete]. Originally, sulfur-extended bituminous concrete was intended for thin surfacing but was found to be suited to the treatment of potholes. The addition of sulfur makes it possible to lower from 250 to 150°C the manufacturing temperature of the product. Studies conducted by the Laboratoire central des Ponts et Chaussées have led to the use of 5.4% (in weight) of sulfur in the material, achieving good indentation strength, good creep resistance and good skid resistance on all subgrades. After having described the composition of the material, the author looks into the different placement phases. Sulfur-extended bituminous concrete has many applications: potholes, pavement joints, crazing, preparation of bases before surface dressings. The article also discusses the economic aspects of the material. (Edited author abstract) In French.

**077016 DEVELOPMENT OF MATHEMATICAL MODELS TO ASSESS HIGHWAY MAINTENANCE NEEDS AND ESTABLISH REHABILITATION THRESHOLD LEVELS.** This study examines the mathematical relationship between a variety of pavement attributes, and other quantifiable variables, on the one hand, and maintenance needs and priority evaluations made by district area supervisors on the other. A secondary objective was to establish threshold levels for preventive maintenance, capital maintenance, and rehabilitation. Descriptions, which conform to the Maine Department of Transportation's operations, were included in order to categorize various rehabilitation and maintenance strategies as well as to define various types of maintenance. Measures of pavement distress routinely collected by trained observers and appropriately weighted, using a Delphi technique, proved to correlate the best. (Edited author abstract) 21 refs.

Theberge, Paul E. (Maine DOT, Augusta, ME, USA). *Transp Res Rec* 1109 1987 p 27-35.

**077017 DEVELOPMENT OF A ROUTINE PAVEMENT MAINTENANCE DATA BASE SYSTEM.** To determine what type of data to include in the data base, the relationship between roughness and level of routine maintenance expenditure was analyzed. Condition survey information, based on unit foremen's evaluation of highway deficiencies, may be included in the proposed data base. The condition survey information along with roughness measurements can be used in two ways. Information on rehabilitation activities, such as resurfacing, was included in the data base to increase the level of coordination between the programming of major maintenance and routine maintenance activities. Some other supplementary information, such as average daily traffic, contract number, county, subdistricts, and pavement type, was included in the data base. (Edited author abstract) 8 refs.

**077018 PERFORMANCE EVALUATION OF JOINTED CONCRETE PAVEMENT REHABILITATION WITHOUT RESURFACING.** The methods evaluated were pavement grinding, grout undersealing, installing underdrains, retrofitting double-vee load transfer devices, and pavement patching. Five construction sections, located on Interstates in Illinois, were selected for evaluation. Evaluation was done using crack surveys, destructive testing, and nondestructive testing. The performance factors monitored were faulting, pavement

cracking, pavement roughness, skid resistance, deflection, load transfer, void development, and drainage. A great deal of emphasis was placed on grout undersealing and doweled patching in laboratory and field experiments. The findings of this research resulted in improvements in full-depth patch design, improved construction procedures, and proper use of undersealing. (Edited author abstract) 3 refs.

**077019 MICROCOMPUTER PROGRAM TO EVALUATE COST-EFFECTIVE ALTERNATIVES FOR CONCRETE PAVEMENT RESTORATION.** The life-cycle cost-1 (LCCI) microcomputer program is designed for comprehensive economic evaluation of competing alternatives provided by users. The LCCI program is unique for life-cycle cost analyses because of its flexibility and the options it offers users: it creates and saves multiple input files and provides default data, manipulates input data without going through an entire session, offers seven available optimization options for rank ordering the strategies, and considers multiple maintenance and rehabilitation treatments. The LCCI methodology is capable of computing user operating costs and added user costs due to traffic delays during rehabilitation and reconstruction. (Edited author abstract) 18 refs.

**077020 SYSTEMS APPROACH FOR DESIGN AND EVALUATION OF ALTERNATIVES FOR CONCRETE PAVEMENT REHABILITATION.** The Pavement Rehabilitation Design System (PRDS-1) computer program uses mechanistic analysis to generate numerous rehabilitation design alternatives and perform economic evaluation. The evaluation technique is sensitive to both the performance and the cost of the competing alternatives. Resurfacing alternatives include bituminous concrete, jointed portland cement concrete, and continuously reinforced concrete. The PRDS-1 program was used to evaluate typical concrete pavements for overlay thicknesses and associated life-cycle costs. A comparison of resurfacing alternatives with several restoration alternatives indicates that in certain cases restoration alternatives are more economical. (Edited author abstract) 17 refs.

**077021 MICRO PMS CUT COMPLAINTS BY 75%.** The City of Lansing, Michigan, is maximizing its investment of road funds by acquiring a micro-computer-based pavement management system from Pavement Management Systems, Inc. (PMS). Implementation was completed in 1986, and it has been used for more than one and one-half years by city staff. Prior to that time, the system ran on PMS's home system and analysis results were provided to the city. The system resides in the city's IBM PC/AT. The pavement management system uses FORTRAN77 programs to analyze and manipulate data, and dBASE III to display results and access and update files. Access to the entire system is via a series of screen display menus.

**077022 DEVELOPMENT OF A PREVENTIVE MAINTENANCE ALGORITHM FOR USE IN PAVEMENT MANAGEMENT SYSTEMS.** This paper introduces a new concept in determining distress density limits for the recommendation of preventive maintenance treatments. The procedure described relates distress density directly to the Pavement Condition Index used in the PAVER Pavement Management System. It can be applied to both asphalt concrete and portland cement concrete pavements, and is flexible enough to allow for local policies and economic factors. The initial algorithm may be expanded to include environmental or geographic factors and additional preventive maintenance treatments

at a later date. (Edited author abstract) 10 refs.

**077023 PAVEMENT PERFORMANCE PREDICTION MODEL USING THE MARKOV PROCESS.** A combination of homogeneous and nonhomogeneous Markov chains has been used in the development of the model. The life span of the pavement is divided into zones, with each zone representing a period of 6 years. The transition matrix of each zone is determined using nonlinear programming. If the state of any given pavement section is known, its future condition can be predicted efficiently from the corresponding transition matrices. The model presented will play an integral part in the decision-making procedure for determining optimal maintenance and repair strategies. A comparison between the Markov model and the constrained least-squares model is presented. (Edited author abstract) 10 refs.

Butt, Abbas A. (US Army Construction Engineering Research Lab, Champaign, IL, USA); Shahin, Mohamed Y.; Feighan, Kieran J.; Carpenter, Samuel H. *Transp Res Rec* 1123 1987 p 12-19.

**077024 DEVELOPMENT OF A METHODOLOGY TO ESTIMATE PAVEMENT MAINTENANCE AND REPAIR COSTS FOR DIFFERENT RANGES OF PAVEMENT CONDITION INDEX.** Data from a number of military installations in the United States were used. The analysis was performed separately for each installation. The methodology developed included techniques for determining the fixed initial construction cost of each alternative based on local prices; the cost of pavement preparation before repair as a function of pavement type, condition, local prices, and installation policy for pavement preparation; the annual cost of routine maintenance of each maintenance and repair alternative as a function of pavement condition, local prices, and installation maintenance policy; pavement performance characteristics for various pavement categories; and conducting a life-cycle cost analysis of each alternative for all pavement categories. (Edited author abstract) 4 refs.

**077025 PAVEMENT MANAGEMENT AT THE LOCAL GOVERNMENT LEVEL.** A discussion is presented of factors to be considered in planning and developing a pavement management system based on the experiences of these organizations. In the planning phase consideration is given to resource requirements (personnel, equipment, and funds) and to information requirements (primarily the type of data to be collected). Specific considerations associated with actual development include: section identification, condition surveys, maintenance and rehabilitation alternatives, data utilization, and report preparation. Practices of the 13 agencies relative to these considerations are summarized in a series of tables for ready reference. (Edited author abstract) 9 refs.

**077026 COMPREHENSIVE RANKING SYSTEM FOR LOCAL AGENCY PAVEMENT MANAGEMENT.** An approach has been developed that uses a minimum of information to make reasonable budget analysis concerning maintenance and rehabilitation needs with unconstrained funding. The way in which funding needs are allocated when funding is less than needs is described. It includes consideration of the condition of the pavement, change of condition over time, cost of the maintenance or rehabilitation over time, and stopgap maintenance generated by deferring maintenance. This was accomplished by making it simple for the public

works personnel to visualize and use. It is part of a network-level microcomputer-based pavement management system developed for San Francisco Bay Area agencies. (Edited author abstract) 24 refs.

**077027 NEW ROADS FOR THE MICRO.** This paper analyzes various levels of roadway maintenance and treatment cost miniaturization. Using microcomputers loaded with database software and Fortran programming, engineers are gaining control of pavement maintenance. The computer-based pavement management starts with "condition surveys," rating existing pavement against a predetermined rating scale. The user also establishes a decay curve; the computer then extrapolates the one-time surveys. The product, which is printed in report format, shows which road should be repaired, when they should be repaired and how much it will cost. 3 refs.

**077028 PHARR DISTRICT USES THE REHABILITATION AND MAINTENANCE SYSTEM OPTIMIZATION MODEL.** Pharr Highway District 21 is serving as a pilot test site in Texas for a pavement management optimization program developed at the Texas Transportation Institute. The Rehabilitation and Maintenance System District Optimization model one, RAMS-DO-1, is one of seven programs that make up the Rehabilitation and Maintenance System (RAMS). Developed by TTI research engineer Robert L. Lytton, this set of programs is a consecutive and interrelated system designed to identify and schedule cost-effective and optimal rehabilitation and maintenance strategies for an entire highway network. By selecting the optimal combination and timing of maintenance and rehabilitation treatments, the lives of highway sections of a network can be extended, thus maximizing the effectiveness of highway maintenance expenditures.

Anon. *Tex Transp Res* v 23 n 1 Mar 1987 p 3-4.

**077029 ANALYTICAL FRAMEWORK FOR OPTIMIZING PAVEMENT MAINTENANCE.** The problem of scheduling maintenance for pavements in an optimum fashion has been approached in a variety of ways by researchers and practitioners. However, the Markov decision process has found very limited use despite the fact that cumulative damage is readily modeled by a Markov chain and that a wealth of immediately applicable theoretical results exist in the literature. The solutions are known for a variety of problems involving inspection, repair, and replacement, making it possible to solve directly for an optimal policy in the form of a control law. This paper reviews some of the relevant theoretical results in order to call them to the attention of civil engineers involved with pavement management systems. (Author abstract) 23 refs.

**077030 STATUS OF THE SOUTH DAKOTA PROFILOMETER.** During 1981-1982, the South Dakota Department of Transportation (SDDOT) developed a low-cost profilometer system. The unit has been used to conduct annual statewide profile surveys primarily for pavement management purposes. The University of Michigan Transportation Research Institute (UMTRI) draft report of October 1985 showed that the performance of the SDDOT profilometer was deficient in two respects. First, the beginnings of measured profiles showed extraneous long-wavelength content. Second, the system underestimated the profile magnitudes generally, but most severely on smooth highway sections, at lower test speeds, and at longer wavelengths. Changes have been made to allow rut depth measurement and visual rating of highway condition parameters to occur simultaneously with profile

measurement. (Edited author abstract) 2 refs.

**077031 NEW TECHNIQUES FOR MODELING PAVEMENT DETERIORATION.** The mathematical models investigated are: stepwise regression, B-spline approximation, and constrained least-squares estimation. The best features of each are integrated into an interactive format capable of operating within the PAVER pavement management system. Pavement sections from a given location consisting of the same pavement type, use, and rank are grouped into families. Models that filter obvious errors and statistical outliers from the data are applied to the family data. These procedures constitute a complete method to model and predict pavement family behavior and pavement section behavior accurately. (Edited author abstract) 6 refs.

## Mechanical Properties

**077035 RECYCLED ASPHALT MAKES A BETTER PAVEMENT IN JAPAN.** The recycled asphalt mixtures are made by two methods. One is by the addition of old mixture into the new. It is referred to as the Blending Method. Another is by use of recycling agents referred to as the Rejuvenating Method. In the Blending Method, old asphalt mixture is re-used together with new asphalt mixture. The old mixtures is not heated directly, but by radiation of hot new material. In the Rejuvenating

Method, old asphalt mixture is heated and mixed in a special plant for re-use. Consistency of asphalt is controlled by addition of recycling agents. This paper presents findings of research on mechanical characterization of recycled asphalt mixtures made by the two methods. 4 refs.

**077036 ENGINEERING PROPERTIES OF ROLLER-COMPACTED CONCRETE.** An investigation was conducted to develop a procedure for the design of roller-compacted concrete (RCC) pavements. This paper is a report on the laboratory portion of the investigation that was conducted to determine the engineering properties of RCC. Specimens for the laboratory tests were obtained from a full-scale test section constructed using a 10-ton vibratory roller. Specimens were tested for flexural, split-tensile, and compressive strength; modulus of elasticity; and fatigue properties. The engineering behavior of RCC was determined to be similar to that of conventional concrete. Test results for RCC made using 243 to 285 lb/yd<sup>3</sup> of cement show that RCC is capable of providing relatively high in-place strength. As with conventional concrete, RCC strengths produced are even higher when higher cement contents are used. Specimens prepared by using the vibrating table produced significantly lower densities and strengths because the moisture content was lowered. (Edited author abstract). 7 refs.

**077037 DYNAMIC RESPONSE OF PAVING MATERIALS.** Equipment developed to determine the dynamic properties of paving materials in axial and torsional loading is described. Dynamic properties were determined by the excitation of hollow cylindrical specimens using two independent sinusoidal loads with frequencies up to 30 Hz. An IBM PC/AT equipped with a Metrabyte DASH 16 data acquisition board was used to directly control two MTS hydraulic servos. Menu-driven software was developed, taking advantage of direct memory access channels, so that data acquisition, wave form generation, and closed-loop control could take place simultaneously at rates above 5000 samples/sec/channel. To convert raw data into graphs and parameters representative of dynamic material properties, a postprocessing menu-driven program was also developed. Dynamic properties of an asphalt concrete, a uniform sand, and a silty clay are presented. (Edited author abstract). 6 refs.

## Moisture

**077038 ANTISTRIPE ADDITIVES: BACKGROUND FOR A FIELD PERFORMANCE STUDY.** This paper presents the results of a study on the effectiveness of antistripe additives for materials used in the reconstruction of Nevada State Highway 207. Preconstruction mixtures containing various antistripping additives (liquids and solids), construction mixtures mixed in the field and compacted in the laboratory, and cores taken after construction were subjected to laboratory conditioning using vacuum saturation plus one cycle of freeze-thaw. Test results show that a slight reduction in water sensitivity was obtained in mixtures that contained the liquid antistripe additives in comparison with control mixtures without additives or mixtures containing portland cement as an antistripping material. Results of evaluation of mixtures during the preconstruction phase of the project indicate that mixtures that contain lime slurry exhibited significant reductions in water sensitivity. Test results of field cores show agreement with preconstruction mixtures in the prediction of water sensitivity. (Edited author abstract) 11 refs.

Asphalt Mater and Mixtures. Publ by Transportation Research Board, Washington, DC, USA, 1987 p 1-11.

**077039 EVALUATION OF DESIGN HIGH-WATER CLEARANCES FOR PAVEMENTS.** In this paper is described a study to investigate the effect of capillary water presence on permanent deformation of four common Florida subgrade soils. Physical and engineering properties were first determined, with emphasis on developing soil-water retention characteristics. Repetitive triaxial load tests were then performed on the soils, under several different water conditions. These included at optimum, to represent the as-built condition, and at varied water retention conditions, to represent subgrade conditions in service (i.e., in equilibrium with the designated water table). Deformation characteristics of a subgrade fill, at different water condition, were related to pavement rutting in accordance with the Shell Oil criteria. When a tolerable permanent deformation was obtained at a specified water condition, the specimen's location on the soil-water retention curve was determined. The height of the most economical subgrade fill could then be fixed. (Author abstract) 10 refs.

## Moisture Control

**077040 EFFECT OF MOISTURE ON THE STRUCTURAL PERFORMANCE OF A CRUSHED-LIME-STONE ROAD BASE.** A series of repeated load triaxial tests on a crushed-rock aggregate is described, including variations in grading and degree of compaction as well as moisture content. The effects of these variables are discussed and it is found that elastic stiffness tends to decrease slightly with increased moisture content for broadly graded materials. The influence of density is negligible, and that of grading minor, which results in some stiffness reduction as the fines content increases. The accumulation of permanent strain under multicyclic loading is found to be strongly dependent on density; denser material performs better. Grading has a minor effect. Increased moisture content results in substantially increased straining. The value of suction, which could exist in a granular material, is then explored indirectly by means of unconfined compression tests, and its effect on drainage is noted. Permeability measurements are given and their possible effect on drainage considered. (Edited author abstract) 9 refs.

## Nondestructive Examination

**077041 RECENT IMPROVEMENTS IN HIGH RESOLUTION GROUND-PENETRATING RADAR FOR SUBSURFACE PAVEMENT ASSESSMENT.** The ability of short pulse radar (SPR) to detect, locate and characterize surface and airborne targets is well-established and well-documented. This paper presents a description of SPR technology and discusses its usefulness as a nondestructive pavement assessment tool to detect subsurface pavement anomalies. The major components and the functional operation of an SPR system are summarized first. Next, a brief outline of the theoretical background of SPR is provided. The operation of this device from a phenomenological viewpoint is also described. Finally, a commercially available SPR system designed for pavement is described and the results of recent projects are discussed. 15 refs.

Vogt, Woodward L. (MRA/Materials Engineers, Houston, TX, USA); Brown, Danny R. *Tex Civ Eng* v 57 n 9 Nov 1987 p 14-20.

**077042 USE OF GROUND-PENETRATING RADAR FOR DETECTING VOIDS UNDER A JOINTED CONCRETE PAVEMENT.** A survey of a jointed, reinforced concrete pavement with ground-penetrating radar indicated that radar provides a non-destructive inspection technique that can be used at a minimum

rate of 5 lane-miles of pavement per hour with only minimal interference with traffic. The coring of some slabs and subsequent use of a devised water test revealed that the radar was effective in detecting voids deeper than 1/8 in. but considerably less effective in spotting shallow voids. The overall accuracy was approximately 68 percent, which indicates that the sensitivity of the equipment needs to be improved. The location component used with the radar unit showed insufficient accuracy. (Edited author abstract) 6 refs.

**077043 VOID DETECTION AND RIGID PAVEMENT UNDERSEALING IN INDIANA: A COMPREHENSIVE APPROACH.** The method uses Dynaflect deflections measured at regular (100-ft) intervals within each contract section. Decision criteria based on midslab deflections are established for each contract; Sensor 5 is the primary indicator variable. Because decision criteria are obtained independently for each contract section, the method is applicable to both jointed and continuously reinforced concrete sections and to previously overlaid sections. When the areas that require undersealing have been identified, all cracks and joints within each area are treated. The procedure involves carefully monitoring slab motion during material injection with a sensitive deflection gauge developed specifically for that purpose. (Edited author abstract) 5 refs.

Mutti, Roger A. (Oregon State Univ, Corvallis, OR, USA); Sudol, Joseph J.; Love, Bradley W. *Transp Res Rec* 1109 1987 p 11-17.

**077044 NEW NONDESTRUCTIVE PAVEMENT EVALUATION METHOD.** Rapid nondestructive evaluation of pavements is needed to help maintain highways and airport runways. A review of current techniques for measuring pavement profile, texture, and deflection under load is conducted. Rapid evaluation of these parameters is needed, due to the high cost of closing highways and runways. The problem of improving the ability of pavement engineers to make these measurements is addressed first by reviewing existing procedures for obtaining these measurements, and then by presenting a new procedure to allow the pavement engineer to measure these three criteria. The proposed procedure allows this absolute measurement to be made. (Edited author abstract) 31 refs.

Elton, David J. (Auburn Univ, Auburn, AL, USA); Harr, Milton E. *J Transp Eng* v 114 n 1 Jan 1988 p 76-92.

**077045 DETERMINATION OF LAYER MODULI USING A FALLING WEIGHT DEFLECTOMETER.** The increasing popularity of nondestructive pavement evaluation methods, based on interpretation of surface deflections, has prompted the development of several different types of nondestructive testing (NDT) devices. One such device is the falling weight deflectometer (FWD), which was used in the evaluation of layer moduli of three pavement sections. Several methods are currently available to interpret the FWD deflection data and backcalculate the layer moduli. Four methods selected for analysis of the deflection data included VESYS, ELMOD, OAF, and MODCOMP2. A comparison of the material properties determined in the laboratory and the backcalculated values indicated that two of the four methods, namely, VESYS and ELMOD, had great potential for pavement evaluation. **077046 ANALYTICAL EVALUATION OF VARIABLES AFFECTING SURFACE WAVE TESTING OF PAVEMENTS.** Spectral-Analysis-of-Surface Waves (SASW) is a promising nondestructive technique for evaluating the mechanical properties of pavement systems and soil deposits. In applying the technique, it is assumed that only plane Rayleigh waves are generated by the

source. In reality, when an impulse is applied at the top of a layered system, body waves (shear and compression waves) and other types of surface waves are produced along with Rayleigh waves. In this paper, the dispersion curves (frequency or wavelength versus phase velocity) obtained by assuming only plane Rayleigh waves are compared with dispersion curves obtained when all types of waves are considered. Several cases with different types of layering are studied, and emphasis is placed on typical pavement systems. It is found that the receiver arrangement can significantly influence the dispersion curve and, hence, the resulting modulus profile. (Edited author abstract) 20 Refs.

**077047 RUTTING OF ASPHALT CONCRETE OVERLAYS ON CONTINUOUSLY REINFORCED CONCRETE PAVEMENTS IN TEXAS.** Using the limited data available at the present time, it was observed that the rate of rutting was maximum in the first year because of the initial compaction of material in the wheelpath. In the second year, the material between the wheelpaths experienced more compaction than that in the wheelpaths themselves, and therefore rutting was observed to decrease in the second year. However, rutting increased in the years following full compaction of the lanes. A regression equation was developed to characterize the rutting behavior. The analysis of available data indicated that overlay thickness was an important predictor of rutting in overlays. The age of the overlay was not very significant in the regression equation. (Edited author abstract) 1 ref.

**077048 OVERLAYING THE M.18 WITH CONCRETE.** Continuously reinforced concrete pavements (CRCP) have been used extensively for the construction of major roads in the United States of America and Belgium over the past twenty-five years. While other European countries have now started to follow suit, their use in Great Britain has been very limited. In 1985, the Department of Transport selected the northbound carriageway of the M.18 between Junction 6 near Thorne and Junction 35 of the M62 for an important trial in the use of continuously reinforced concrete as an overlay. This was the first time it had been used to overlay a motorway in Great Britain.

**077049 MECHANISTIC MODEL FOR THERMALLY INDUCED REFLECTION CRACKING OF PORTLAND CEMENT CONCRETE PAVEMENT WITH REINFORCED ASPHALT CONCRETE OVERLAY.** A new model is presented to analyze the phenomenon of thermally induced reflection cracking of asphalt concrete overlays over portland cement concrete pavements. The model is based on fundamental material properties of creep compliance, fracture toughness, and indirect tensile strength and does not depend on any empirical distress functions. When applied to fabric-reinforced overlays, however, a fabric effectiveness factor is required. This factor is obtained from single laboratory thermal simulation tests on beams and is defined as the ratio of failure times of reinforced and unreinforced

(control) beams. The reflection cracking analysis model has been computer coded as RECK. (Edited author abstract) 11 refs.

**077050 NEW MEXICO STUDY OF INTERLAYERS USED IN REFLECTIVE CRACK CONTROL.** The application of an overlay restores the riding quality and skid properties and prolongs the service life of a roadway that has deteriorated. This type of rehabilitation may result in a new problem, reflective cracking, where subsurface cracks propagate into and through the protective overlay. By placing some form of interlayer between the old deteriorated pavement and the new overlay, reflective cracking may be reduced or even prevented. Thus, the useful life of the overlay is increased, resulting in a savings in maintenance costs. New Mexico established several experimental projects under Category 2 experimental construction in which different forms of interlayers were used. (Edited author abstract) 2 refs.

**077051 ESTIMATING THE LIFE OF ASPHALT OVERLAYS USING LONG-TERM PAVEMENT PERFORMANCE DATA.** Asphalt concrete overlays of flexible pavements are the most common pavement rehabilitation treatment in Ontario. In this paper the development of mathematical models for the performance prediction of these overlays is described. The modeling approach was based on a statistical evaluation of observed overlay performance and used readily available data. Its objective was to develop performance prediction models that would fit the existing pavement management system and could be used for life cycle economic analyses. The duration of overlay life cycle, for a predetermined terminal serviceability, was estimated as a function of overlay thickness, traffic (in number of equivalent single axles), maintenance patching, and life cycle duration of the initial pavement. (Edited author abstract) 13 refs.

**077052 CONCRETE OVERLAYS POSE CHALLENGE TO ASPHALT.** The trend to concrete overlays lies in their better performance, minimal maintenance and competitive costs. Compared to asphaltic overlays, not only are concrete overlays expected to last long, but their cost, which is now in close vicinity of asphaltic overlays, is also expected to drop, once the technology of concrete overlays is perfected. The concrete industry in the U.S.A. believes that concrete overlays will soon be a viable competitor on even the busiest of highways. Concrete overlays are classified into two categories, namely, bonded and unbonded. Depending upon requirements and site conditions, an overlay can be of plain concrete conventionally-reinforced concrete, or continuously-reinforced concrete. These and other aspects of the subject are discussed.

Anon. *Indian Concr J* v 62 n 2 Feb 1988 p 60-61, 96.

**077053 FIELD ANALYSIS OF RUTTING IN OVERLAYS OF CONCRETE INTERSTATE PAVEMENTS IN ILLINOIS.** Thirty-two overlay projects placed over portland cement concrete pavements were surveyed for the initial development of a comprehensive statewide pavement data base of which these overlay projects would be part. Ninety-two different uniform sections were visually surveyed to obtain performance data on the overlay projects. Design and construction data were collected for inclusion in the data base. The data were analyzed to develop regression relations between rutting and mixture properties of the asphalt concrete overlays. The analysis clearly shows the importance of material properties to the development of rutting, particularly the gradation parameters. The structural tests clearly show that the resilient modulus and indirect tensile

strength bear a strong relationship to the rutting that develops in the overlay during its life. The analysis in this paper clearly shows how a statistically sound examination of pavement performance can furnish data for an analysis that provides information that can be used to alter mix design and construction practices to address a specific problem. It is shown that permanent deformation can be controlled through proper material control. (Edited author abstract) 6 refs.

**077054 EFFECT OF CONCRETE OVERLAY DEBONDING ON PAVEMENT PERFORMANCE.** The objectives of this paper were to determine the effect of bond loss on response and performance of bonded concrete overlays and to examine present bonding techniques and bond loss detection methodologies. A finite-element model called ILLI-SLAB was used to evaluate pavement response to load, and Westergaard-Bradbury equations were used to determine curling stresses. It was found that loss of bond adversely affects maximum pavement tensile stress (thus fatigue life) and maximum pavement deflections. It is also believed that curling stresses may cause unbonded thin overlays to separate from the underlying slab, causing extremely high stress in the overlay if a load is applied. The only way bond can be obtained is to follow good construction techniques. A summary of these techniques is presented in the paper. On the basis of deflection analysis it was concluded that it may be possible to detect bond loss using nondestructive testing of corner deflections. (Author abstract) 15 refs.

**077055 HOW LONG SHOULD PAVEMENT LAST?** The number and type of vehicles have the most significant impact on pavement performance. Climate, including temperature fluctuations, maximum temperature, minimum temperature, rainfall, and duration of freezing conditions can also contribute substantially to pavement deterioration. The roadbed soil which ultimately supports the pavement is also important. This article discusses reasons for failure, evaluating good performance, results of an Asphalt Institute study, and other aspects of the subject.

**077056 SMALL ELEMENT PAVING - THE MODERN ALTERNATIVE FOR TODAY'S TRAFFIC CONDITIONS.** The late 1970s signalled the beginning of a downward trend in the sales of conventional precast concrete flags. An 'unrealised change of use' - most importantly the heavy increase in vehicular overrun - brought about by modern traffic conditions, had sown the seeds of decline. The paper describes how and why the high-performance small-element flag has emerged as the natural choice for engineers in an ever increasing range of applications. (Edited author abstract) 2 refs.

**077057 COST-EFFECTIVE SURFACING FOR TRACKED-VEHICLE TRAFFIC.** There is a need for cost-effective surfacings for areas subjected to tracked-vehicle traffic to reduce maintenance costs and improve safety. Surveys of several locations with tracked-vehicle traffic were made to observe pavement conditions and maintenance requirements. These observations demonstrated that pavement performance depended on how local personnel perceived their problems and local repair methods. A test section to evaluate several mixtures was constructed and tested at Fort Stewart, Georgia. The items tested were these: Fiber-reinforced concrete; Wire-mesh-reinforced concrete; Roller-compacted con-

crete pavement (RCCP) in depths from 4 to 10 in.; Concrete paving blocks over sand-grid base; Latex-modified asphaltic concrete; Steel-slag asphaltic concrete; and State of Georgia standard E-Mix asphaltic concrete. The properties of the various items before and after construction were determined and evaluated. (Edited author abstract) 8 refs.

**077059 ESTIMATION OF ENVIRONMENTAL AND TRAFFIC LOADING EFFECTS ON HIGHWAY PAVEMENTS.** This paper describes the concept of a methodology for assessing quantitatively the relative effects of environmental and traffic loading on pavement performance. The proposed methodology relies upon pavement performance data which are now available in many highway agencies. It includes a procedure to incorporate the effect of routine maintenance on pavement performance in the analysis. A case study is presented as an example of application of the methodology. By analyzing 75 highway routes in Indiana, the case study serves to demonstrate the feasibility of the proposed procedure as a tool for estimating environmental and traffic loading effects on pavement performance at both project and network levels. **077060 PERFORMANCE OF LOAD-TRANSFER DEVICES.** The study reported is part of a large effort to examine various design aspects of rigid pavements in New York. It involves the performance of several types of load-transfer devices (LTDs) for transverse joints. When corrosion and structural deterioration of then-standard LTDs became apparent in the early 1970s, plastic-coated dowels were tried. Soon, epoxy-coated I-beams were put into use and a trial installation of fiberglass dowels was completed. Earliest installations of these devices have since been monitored to determine whether their performance was an improvement. After 10 to 14 years, horizontal and vertical movements along with faulting measurements indicate they are providing better load transfer across transverse joints. 8 refs.

**077061 RELIABILITY ANALYSIS OF PREMIUM PAVEMENT DESIGN FEATURES.** This study evaluates the special features of premium design guidelines - features not considered in the AASHTO flexible and rigid pavement design procedures. The significance of these features - fifteen in all for four pavement types - were investigated by evaluating pavement performance and design reliability. The researchers used the VESYS III program to evaluate features of the flexible pavements and an algorithm developed in a companion paper for the other three types (composite, jointed plain concrete, and continuously reinforced concrete). This computer program, Reliability Analysis and Performance of Pavements I (RAPPI), employs Monte Carlo simulation techniques to treat all of the design variables probabilistically. The effectiveness of each feature is evaluated by comparing the

performance or expected life and reliability of typical pavement sections with and without a premium feature. (Edited author abstract) 12 refs.

George, K.P. (Univ of Mississippi, University, MS, USA); Alsheri, A.; Shah, N.S. *J Transp Eng* v 114 n 3 May 1988 p 278-293.

**077062 RELIABILITY MODEL FOR PAVEMENT PERFORMANCE.** A simulation model to calculate the reliability/performance of pavement is developed. The computer program, Reliability Analysis and Performance of Pavements (RAPPI), employs Monte Carlo simulation techniques to solve the design equations (e.g., AASHTO, Premium) in which all of the design variables are assumed to be probabilistic and normally distributed. RAPPI, in conjunction with the respective design model, calculates the present serviceability index (PSI) of pavements in one-year increments. In addition to uncertainties attributable to the design factors, errors due to idealization of the model are included in the PSI calculation. By comparing the computed PSI with the terminal PSI, assuming that both are normally distributed, standard probabilistic techniques are employed for calculating pavement reliability. (Edited author abstract) 13 refs.

**077063 EVALUATION OF EFFECT OF UNCRUSHED BASE LAYERS ON PAVEMENT PERFORMANCE.** In 1974, the Alaska Department of Highways decided to save money and fuel by removing the base course and placing the asphalt concrete surface directly on the subbase of the Glenn Highway widening project. In 1969, the original two lanes had been constructed with a crushed base course, thus providing an excellent comparison of the performance of the two bases. Contrary to previous research and experience in crushed and uncrushed gravel, the uncrushed base course performed better than the crushed base course; the resilient modulus was higher, and the permanent deformation was lower. The uncrushed base is apparently superior because of a larger maximum particle size and greater maximum density. An analysis of the future performance of the roadway with equal thicknesses of asphalt indicates that the pavement over the uncrushed base would have a longer life than the pavement over the crushed base by 54 percent. (Edited author abstract) 6 refs.

**077064 PERFORMANCE OF A FULL-SCALE PAVEMENT DESIGN EXPERIMENT IN JAMAICA.** The design, construction, and first 4 years' performance of seven experimental sections of road built on the May-Pen bypass in Jamaica are described. The road sections comprise varying pavement thickness of cement-stabilized and unstabilized marly limestones on a relatively weak, imported, clay subgrade having an in situ California bearing ratio (CBR) of 6 percent overlying a granular drainage blanket. After 4 years, about 10 percent of the road pavement (unstabilized bases only) reached a failure condition corresponding to a rut depth of 15 mm. From layer thicknesses, strength distributions, and the deflection performance model, it was possible to predict the performance of the thicker sections of road pavement. At the end of the study, the road was performing well in comparison with expectations from appropriate design charts but the predictions indicated that the relationship between overall thickness and traffic-carrying capacity was somewhat steeper than those of the design charts and therefore the thicker sections of road might not perform as well, relatively, as the thinner sections. (Edited author abstract) 7 refs.

**077065 VIDEO IMAGE DISTRESS ANALYSIS**

**TECHNIQUE FOR IDAHO TRANSPORTATION DEPARTMENT PAVEMENT MANAGEMENT SYSTEM.** The Idaho Transportation Department (ITD) is developing and implementing an automated highway management system, the Pavement Performance Management Information System (PPMIS). The system consists of structural adequacy data, present serviceability data, an surface distress data. Field data for the first two modules are obtained using automated collection techniques. However, surface distress data are still gathered manually and are incorporated into a visual and subjective methodology. The ITD is pursuing a low-cost, technically sound methodology to automate the collection and analysis of surface distress data. Preliminary findings indicate that automation of the distress data module is feasible. During 1985 and 1986, VideoComp videotaped more than 2,400 lane-mi of Idaho's Interstate highways and 380 lane-mi of principal arterial highways. In addition, computer software capable of determining crack type and size has been successfully demonstrated. (Edited author abstract) 4 refs.

**077066 NINE-YEAR PERFORMANCE EVALUATION OF ARIZONA'S PRESTRESSED CONCRETE PAVEMENT.** The Arizona Department of Transportation constructed an experimental prestressed pavement in 1977 and has monitored its condition for the past 9 years. The traffic volume on the pavement has greatly exceeded the design assumptions. Experiments conducted at the time of construction provide valuable data on curling and warping, shrinkage, elastic shortening, and so forth. Annual measurements of roughness and friction number have been collected, and periodic condition surveys have been made. The condition survey conducted in 1986 found that distress had developed in the pavement since the last survey in 1983. (Author abstract). 6 Refs.

#### Protective Coatings

**077067 SEAL COATING PRACTICE IN SASKATCHEWAN.** Seals are used to prevent moisture penetration, arrest fatigue block deterioration, restore friction resistance, and stop ravel. The primary sealing materials used are graded aggregates and high float emulsified asphalts. Some chip sealing with rapid-setting cationic or rubber-modified asphalts have also been used. Performance and defect levels of seals are mainly related to construction quality and are a function of distributor condition, type of asphalt and aggregate, application rates, surface preparation, and construction of joints and the climatic conditions in which they are applied. Seal coats have served Saskatchewan well by deferring the need for more costly rehabilitation by increasing the life of pavement surfaces maintained and easing demands on cash flow. (Edited author abstract) 4 refs.

**077068 LES RETRAITEMENTS EN PLACE DES CHAUSSEES AVEC DES LIANTS HYDRAULIQUES.** [In-Situ Retreatment of Pavements with Hydraulic Binders]. Technical progress had led to the development of high-performance in-situ soil treatment equipment offering the possibility of re-using the already old technique of in-place retreatment of existing pavements. This conventional equipment is used only on light and medium traffic roads without treated bases. Modern machines, already experimented or under devel-

opment, and designed specifically for retreatment, make it possible to extend the field of application of these techniques to higher traffic levels and to old pavements with thick treated bases. The follow-up of completed projects shows that it is possible to obtain satisfactory results if the materials and the pavement have appropriate properties (in particular, pavement thickness and aggregate quality) and if the project was completed correctly with suitable equipment and the right binder. These techniques in fact call for even greater care in the initial design phase (decision to use the technique, mix design, structural design) than in the project execution phase. (Author abstract) In French.

Vautrin, J.-C. (SETRA, Fr); Lefort, M. *Travaux* n 627 Dec 1987 p 32-37.

**077069 SIMPLIFIED METHOD FOR RECYCLING OF BITUMINOUS PAVEMENTS.** Recycling is re-utilization of the aggregate and binder in the existing bituminous pavement requiring fresh renewal or rehabilitation courses. Recycling of distressed or deteriorated asphalt pavement has come up as a handy process to save materials and money. Short supply of bitumen in present times has further accentuated the need for measures to affect economy in bitumen consumption. Economy of 50 to 70 percent of the cost of a fresh layer of equivalent thickness can be effected through recycling process. However, lack of 'know-how' at the field level had so far restricted the use of this technology on a large scale. The successful application of the technology entirely depends upon the availability of suitable plant and personnel.

Dharmvir (UP PWD); Agarwal, P.D. *J Indian Roads Congr* v 48 n 2 Oct 1987 p 301-321.

**077070 RECYCLING CONCRETE PAVEMENTS.** The key reasons to recycle concrete pavements are cost savings and reduced environmental impact. High-quality, new aggregates may be scarce or costly to transport. Crushing old pavement produces good quality coarse aggregate at high production rates. Besides saving money, recycling old pavement on site reduces the environmental effects of waste hauling and disposal.

**Repair** See Also CONCRETE—Bonding; ROADS AND STREETS—Snow and Ice Control.

**077071 PROPERTIES OF HARDENED MPC MORTAR AND CONCRETE RELEVANT TO THE REQUIREMENTS OF RAPID REPAIR OF CONCRETE PAVEMENTS.** There is an increasing need and demand for new materials and methods for rapid but durable repair of concrete pavements, where the closure time is in hours instead of days. The presence of such materials or techniques will, no doubt, reduce dramatically the high cost related to labour, traffic diversion and control. Magnesia-phosphate cement (MPC) based materials provide the essential requirements for rapid repair of concrete. On mixing with water they provide a workable mix which sets within 15 minutes at normal temperature and hardens to sufficient strength, over 20MPa, within one hour. Almost the same performance can be obtained at sub-zero temperatures and in hot weather conditions using special but simple techniques or by the addition of special admixtures.

El-Jazairi, B. (FEB (Great Britain) Ltd). *Concrete (London)* v 21 n 9 Sep 1987 p 25-31.

**077072 ADAPTABLE, ATTACHABLE AND AVAILABLE.** The problem of road reinstatement, particularly where the road surface is only damaged in places, has a new solution from Econ Groups with a one-man-operated machine. Based on a 50hp industrial tractor, the unit has a backmounted cold planer, the CBP 300, and on the front the equivalent of a dustpan and brush - a sweeper-loader device which will brush up the debris and dump it into a trailer. On the side is a small

hydraulic jack hammer for trimming and finishing. All three units are linked to the tractor's hydraulic and power system.

Anon. *Surveyor (Sutton Engl)* v 168 n 4961 Sep 10 1987 p 23.

**077073 REMISE EN ETAT DES CHAUSSEES.** [Repair of Pavements]. The author sums up existing knowledge in the field of methods of non-destructive inspection of flexible pavements and the use of the results of such inspection. For the investigation of structural properties, the only type of non-destructive inspection dealt with here, the author presents available ways and means of recording visible surface deteriorations, measuring the thickness of courses, and evaluating the structural capacity by measuring the propagation of surface waves and by various methods of measuring deflections (under moving load, stationary vibrating load, and falling load). After a brief discussion of how the results of non-destructive pavement inspection may be used in management and maintenance systems, the author deals with their use for determining remaining service life and for the structural design of overlays. He deals with empirical and theoretical methods involving the determination of maximum deflection alone, and then with methods using an analysis of the degree of curvature of the deflection. He presents in particular a critical study of methods enabling a multi-layer model to be adjusted on the basis of the shape of the deflection basin. The way in which such a model may be used to predict the remaining service life of the pavement and to structurally design an overlay is then discussed. (Edited author abstract) In French. 42 refs.

**077074 SOLVING A WEAK LINK IN PAVEMENT PATCHES.** When a street excavation impact assessment was performed in Burlington in 1985, the data clearly indicated that those streets without utility cut patching had a life expectancy of 18.5 years, while those with utility cut patching had a life expectancy of only 10.9 years. The study consisted of performing a visual condition survey and nondestructive deflection testing using state of the art techniques. With the data from the study available, it was important not only to develop a yearly capital paving program, but it became imperative to find more efficient and effective asphalt pavement maintenance procedures to maintain Burlington's 100-mile street system.

Osborne, Bryan K. *Public Works* v 119 n 8 Jul 1988 p 70-71.

**077075 CAN PROGRAMMED PATCHING WORK?** The paper discusses an experimental expert system to help determine how much and what kind of maintenance work need to be completed on a specific road. Data for the system's development came from the experience and judgment of Indiana Department of Highways' unit foremen. The system also provides cost estimates. The system was developed for estimating highway pavement routine maintenance needs at a subdistrict level. The benefits of the system stem from the fact that it relates to the current condition of the road. The data base, developed using information from unit foremen, allow this kind of feedback.

Anon. *Better Roads* v 58 n 8 Aug 1988 p 42-43.

**077076 EVALUATION OF STAINLESS-STEEL PIPES FOR USE AS DOWEL BARS.** Dowel bars are an important load transfer mechanism that reduce the damage to highway pavements caused by pumping and subsequent faulting at the slab-joint interface. Damage to the pavement when these devices corrode has been a significant problem in the past. In an effort to find a method for improving pavement performance and reducing repair costs, a study was performed to evaluate the effectiveness of using stainless-steel pipes as dowel bars. Based on long-term (40 years) field performance studies, stainless-steel (type 316) was selected because of its proven ability to resist corrosion. Pipe was chosen over a solid

stainless-steel bar for cost considerations. The data from the initial tests produced useful results on load-carrying capacity of concrete-filled and hollow-dowel pipe. 5 refs.

## Research

**077077 PAVING PERSPECTIVE - CONCRETE OPTIONS.** This paper discusses the concrete options of paving perspective. Concrete which is used for paving work has evolved and its specification has changed considerably as concrete pavement life, durability and economy has improved. The primary national specification for roadworks needs to be studied in some detail, yet it also needs to be seen in perspective as part of the broader picture of change. The paving options and applications (and the matrix of possible combinations) are extensive but still not complete. It is possible to expand the study to include construction methods, techniques and indeed the features and benefits of old, current and new cement, using CBM and concrete systems. New standard designs were published by the Department of Transport in 1987 and these set the standards for modern main road pavements and include jointed unreinforced concrete pavements; jointed reinforced concrete pavements, continuously reinforced concrete road base design which carries a replaceable thin 'black' surfacing. 10 refs.

Walker, Brian (British Cement Assoc. Engl). *Highways (Croydon Engl)* v 56 n 1936 Apr 1988 p 52-53.

## Seals

**077078 SEAL COATS IN MANITOBA.** Seal coats are applied to seal out moisture, provide a lighter colored surface for nighttime visibility, improve skid resistance, and reduce pavement oxidation. A side benefit is the improvement in appearance by covering sealed and unsealed cracks and any patching that had been required. More than 300 miles of seal coats are placed annually by two permanent summer crews. Application and cost data relative to Manitoba's program are presented. (Edited author abstract) 4 refs.

Young, F.; Robinson, A.; Rowley, B. *Transp Res Rec* 1096 1986 p 135-139.

## Service Life

**077079 PRESENT SERVICEABILITY-ROUGHNESS CORRELATIONS USING RATING PANEL DATA.** The Kansas Department of Transportation (KDOT) has completed an extensive study of pavement serviceability using 24-member rating panels. The AASHTO five-point segmented rating scale and the three-point segmented rating scale designed to develop serviceability estimates directly related to KDOT pavement management system roughness levels were used. The average standard deviation of individual panel ratings over all pavement types was approximately 12 percent of the maximum scale value. This value corresponds to 0.60 for the AASHTO five-point scale and 0.36 for the KDOT three-point scale; these standard deviations appear to be consistent for panel sizes  $\geq 24$ . A statistically significant correlation was established between the AASHTO five-point and KDOT three-point present serviceability rating (PSR) values. It appears that the three-point PSR data are consistent at terminal serviceability values associated with the AASHTO five-point scale. (Edited author abstract) 11 refs.

Moore, Raymond K. (Univ of Kansas, Lawrence, KS, USA); Clark, G. Norman; Plumb, Gary N. *Transp Res Rec* 1117 1987 p 152-158.

**077080 REEVALUATION OF SHELL LIFE BY MECHANO-LATTICE ANALYSIS.** The influence of residual stresses and strain on the fatigue and rutting life of flexible pavements is investigated theoretically using Yandell's mechano-lattice technique. The investigation concentrates on a hypothetical study that has revealed that residual stresses are built up due to the variations of

plastic behavior between the various layers of the pavements. This study indicates that the mechano-lattice method, which assesses the effects of the plasticity of road materials on the pavement structure, can improve the precision of flexible pavement designs. (Author abstract) 11 refs.

## Standards

**077081 NEW DTp DESIGN STANDARDS WILL PUT THE SQUEEZE ON FLEXIBLE-COMPOSITE PAVEMENTS.** A little over a year after the introduction of the 6th edition of the Specification for Highway Works and a year since it first appeared in draft form, the Department of Transport (DTp) has issued its standard on the structural or thickness design of pavements for motorways and trunk roads. From the point of view of convenience it is most welcome, since the profession can at last turn to just one document for trunk road pavement thickness design instead of the four that it replaces. By militating against the use of flexible composite pavements, the recently published standard for the structural design of new road pavements could have the unfortunate effect of polarizing the highways industry even more than it is today, creating less real choice of pavement, less competitiveness and greater construction costs. 10 refs.

Stresses See Also HIGHWAY TRAFFIC CONTROL—Computer Applications.

**077082 SCHADEN AN EINEM BEFAHRENNEN BETONWERKSTEIN-BELAG.** [Damages to a Trafficked Precast Concrete Tile Surfacing]. Pavements which have to carry vehicular traffic are subjected to particularly high mechanical stress. This situation places special demands on every aspect of pavement construction and especially on the surfacing. In a shopping center, 2500 m<sup>2</sup> precast concrete paving tiles size 25 x 25 cm were laid as surfacing. Jurassic yellow was employed as aggregate for the tiles and white cement as binder to meet the optical requirements. The surfacing is subjected to the typical rolling loads expected in such areas, i.e. shopping carts and hand pallet trucks used for storing goods in shelves. About 3 months after the shopping center had opened, a few isolated tiles were found to have damaged surfaces. This paper analyzes the causes of damage and repair methods.

Pickel, Ulrich; Permesang, Claus; Hofmann, Olaf. *Betonwerk Fertigteil Tech* v 54 n 5 May 1988 p 69-74.

**077083 JOINT SHEAR TRANSFER EFFECTS ON PAVEMENT BEHAVIOR.** This paper focuses on the relationship between shear transfer capabilities across pavement joints and the effects on the behavior of the pavement. The approach of the present study is to develop a numerical model that could accurately represent the mechanism for shear transfer across reinforced concrete pavement joints and implement it in an existing finite element code. That tool is then used for the analyses of various pavements for which experimental data are available; the model is further refined until the numerical results are in good agreement with the experimental information. This approach is employed for the interpretation of pavement behavior under different combinations of joint shear transfer conditions, asphalt concrete overlay thickness and material properties, and the influence of postpumping damage. (Edited author abstract). 20 Refs.

## Structural Analysis

**077084 DEVELOPMENT OF PAVEMENT STRUCTURAL SUBSYSTEMS.** The primary objective of the investigation described in this report was to develop a series of models designed to predict physical distress in asphalt-type pavements. Specifically, methods have been developed that attempt to predict when and how much fatigue cracking and rutting will occur and when low-temperature cracking can be expected. The working hypothesis for the development of the prediction subsystems was the assumption that the forms of distress predicted are related to some combination of stress, strain, or deformation within the pavement and that these responses can be calculated on the basis of estimates of the elastic constants of the pavement and subgrade materials. The computer programs have been developed through the investigation and are referred to as PDMAP (Probabilistic Distress Models for Asphalt Pavements) and COLD (Computation of Low-Temperature Damage). The PDMAP program is designed to predict fatigue cracking and rutting in asphalt-type pavements. (Edited author abstract) 73 refs.

**077085 RIGID PAVEMENT UPLIFT.** The possibility of uplift of the pavement slab under the influence of traffic loading has not been examined, although it is very important to investigate the influence of uplift on stresses. There is no doubt that a possibility of uplift does exist, because only compression stresses be may sustained at the slab-subgrade interface. That means that a problem of unilateral contact appears. In the case that tension stresses would have been withstandable we would have bilateral contact. The solution of a problem of unilateral contact by analytical methods presents many mathematical difficulties. In this paper the algorithm of Theil and Van de Panne as it was modified by P.D. Panagiotopoulos has been used. It is a trial and error method using special criteria providing the convergence of the procedure and the validity of the solution. 5 refs.

## Structural Design See Also BRIDGES—Approaches.

**077086 STRUCTURAL DESIGN FOR CONCRETE BLOCK ROADS.** During the last few years, concrete block pavement design has advanced on these fronts: a better understanding of the use of civil engineering materials in concrete block paving has been gained. There is now sufficient experience and data available to prevent any inadequate materials from being specified and the concept of Peak Shear Stress Ratio should be applied to all sub-base specifications. The widespread use of concrete block paving on small lightly trafficked areas has led to the development of satisfactory well established design and construction methods. Concrete blocks have become an orthodox solution to heavy duty pavement problems for many designers. 10 refs.

Knapton, John (Nigel Nixon, Knapton & Partners). *Highways (Croydon Engl)* v 56 n 1935 Mar 1988 p 20, 22, 25.

**077087 MICROCOMPUTER PROCEDURE TO ANALYZE AXLE LOAD LIMITS AND PAVEMENT DAMAGE RESPONSIBILITY.** The program generates information concerning predicted years to failure for different load limits. In addition, simple charts were developed to allow engineers to conduct a load-limit analysis in the absence of deflection measurements and to determine pavement damage responsibility for different axle loads. Results of an example application of the procedure indicate more damage responsibility for heavy loads on thin pavements than on thick pavements, as would be expected. However, cost allocation based on marginal pavement damage can be misleading if the initial cost of construction is not considered. (Edited author abstract) 9 refs.

**077088 VERIFICATION DES METHODES DE DIMENSIONNEMENT DES CHAUSSEES. SECTIONS D'ESSAIS. SECTIONS DE SUIVI DES DEGRADATIONS. BILAN STATISTIQUE DES STRUCTURES.** [Verification of Methods of Structural Design of Pavements: Test Sections, Sections for the Following Up of Deteriorations, and Statistical Report of Structures]. As soon as the first rational methods of structural design and overlaying were introduced in France in 1965, a test section programme was established to progressively improve the accuracy of the methods. The sections were defined and selected so as to constitute real and representative cases. An experimental procedure was developed involving numerous means of non-destructive testing to be applied at adjustable frequencies. Experimental verification of behavior was carried out on sections mostly between ten and twenty years old. As a complement to this study, a specific sample of two hundred sections of road 1 kilometer long, called sections for the following up of deteriorations, was adopted for the purpose of discerning laws governing the formation and evolution of apparent deteriorations. Lastly, a statistical report of the behavior of maintained pavements was prepared. The three aspects of this study are complementary, and contribute to: the detailed verification of methods of designing and building pavements, and the advancement of these methods; the prediction of surface deteriorations on which maintenance work depends, and strategies of intervention; and an overall verification of design, construction and maintenance taken as a whole. (Edited author abstract) In French. 16 refs.

Siffert, Marcel. *Bull Liaison Lab Ponts Chaussees* n 153 Jan-Feb 1988 p 37-46.

**077089 EVALUATION DU TRAFIC LOURD ET APPLICATION AU DIMENSIONNEMENT STRUCTUREL DES CHAUSSEES.** [Evaluation of Heavy Traffic and Its Application to the Structural Design of Highways]. The evaluation of the moving loads carried by pavements and road structures is seen to be essential to rational construction and maintenance. Existing methods of evaluating traffic loads and their effects are in general cumbersome and inadequate. In France, the piezo-electric ceramic cable has been the subject of much study and development as a detector of traffic, and more precisely, loads. This detector is more economical and easier to maintain than traditional systems; it is susceptible of widespread use in many fields of application. A method of evaluating traffic on the basis of the real effects of loads, based on the use of this type of detector, would doubtless make it possible to improve the precision of methods of structural design of pavements and to establish priorities where maintenance is concerned. (Edited author abstract). 8 Refs. In French.

**077090 COMPARATIVE STUDY OF THE METHODOLOGY OF FLEXIBLE PAVEMENT DESIGN IN USA AND INDIA.** The most commonly used procedures in the U.S.A. for the design of flexible pavements are those contained in the AASHTO Interim Guide for the Design of Flexible Pavement Structures. The design procedures include the determination of total thickness of the pavement structure, as well as the thickness of the individual structural layers. The design methods being used in India include: group index method; California bearing ratio method; California R-Value or stability meter method; tri-axial test method; McLeod method; Burmister method. Flexible pavements in India are being designed within the framework of guidelines set by the Indian Roads Congress. 13 Refs.

Sharma, M.C. (Public Works Dep, Jaipur, India); Saxena, H.N. *Indian Highw* v 16 n 5 May 1988 p 23-47.

**077091 DESIGN-RELATED DISTRESS IN CONCRETE PAVEMENTS.** Concrete pavements that are

properly designed and constructed will perform well and may even outlast their design life. This study discusses the cause of premature cracking in a concrete-concrete pavement system with unbonded interface, tied and doweled joints, and variable-length slabs with skewed joints. Results of tests, analyses, and field inspection of the pavement, on I-75 south of Tampa, Fla., are presented. (Edited author abstract). 5 Refs.

## Surface Properties

**077092 TEXTURING CONCRETE PAVEMENTS.** Increased traffic volumes and speeds have increased the need for an improved skid-resistant surface. The emphasis has been to improve skid resistance by creating new surface textures that increase the 'macrotexture' of the concrete pavement. These textures are created by forming the deeper textures in the plastic concrete during the finishing operations. Skid resistance has also been improved in existing concrete pavements by sawing grooves in the hardened concrete with cutting heads composed of a number of circular diamond saw blades. **077093 TEST RESULTS AND ANALYSIS OF THE ALF TRIAL AT BENALLA, VICTORIA.** This paper describes the second trial conducted with the Accelerated Loading Facility on a section of crushed rock pavement surfaced with a spray seal and subjected to heavy traffic loading. The pavement was subjected to a total of 1,400,000 cycles of a nominal load of 80 kN and pavement response and performance was monitored in terms of residual and resilient deformation, the latter both on the surface and within the pavement. Although the pavement did not deteriorate structurally, the surface seal had to be fully rehabilitated twice and many minor repairs were carried out in order to maintain a waterproof surface. Analysis of the results indicated the stress (load) sensitive nature of the pavement. Ignoring the nonlinear characteristics of the pavement led to significant errors in the estimation of pavement life under different load magnitudes and traffic conditions. Additional study results are discussed. (Edited author abstract) 18 refs.

Kadar, P. (Australian Road Research Board). *Aust Road Res* v 17 n 2 Jun 1987 p 87-101.

**077094 EFFECT OF TEST CONDITION PARAMETERS ON IRR<sub>R</sub>.** The index of retained resilient modulus (IRR<sub>R</sub>) is used to assess moisture-induced distress in asphalt concrete mixtures. The IRR<sub>R</sub> represents the ratio of two moduli and is sensitive to slight deviations in each measured value of modulus. A laboratory and analytical research program was conducted to examine the effect of variations in test condition parameters on the resilient modulus, M<sub>R</sub>, and the IRR<sub>R</sub>. In the laboratory test program, the strain and temperature dependencies of the M<sub>R</sub> were determined for a dense-graded asphalt concrete mixture. The results indicate that constant stress testing may result in a misinterpretation of the IRR<sub>R</sub>, and, further, tests conducted within the currently accepted temperature range may result in a ±20% deviation in the IRR<sub>R</sub>. In the analytical program, the effect of diametral test boundary

conditions on the measured value of  $M_r$  was evaluated using two- and three-dimensional finite element models. (Edited author abstract) 17 refs.

**077095 CHOICE OF DIFFERENT PAVING GRADE BITUMENS FOR DIFFERENT CLIMATIC REGIONS OF INDIA.** The paper deals with the problem of choice of appropriate grade of paving bitumen for different climatic regions of India. The performance evaluation of five test-tracks laid with five grades of paving bitumen namely 30/40, 40/50, 50/60, 60/70, and 80/100 in five distinct climatic regions of India viz. Sikar (low rainfall) Delhi (moderate rainfall) Trivandrum (heavy rainfall coastal region) Cherrapunjee (very heavy rainfall region) and Shimla (snow-bound region) indicated that a minimum of three grades of paving bitumen namely 30/40, 50/60 and 80/100 are technically needed for the country. Specific recommendations are made regarding choice of these three paving grade bitumens based on considerations of climatic conditions and traffic intensity. The findings of the Paper will help in the production and distribution of different paving grade bitumens in the country. (Author abstract) 8 refs.

**077096 EXAMINATION OF ENVIRONMENTAL VERSUS LOAD EFFECTS ON PAVEMENTS.** This paper is a summary of the results of a study under taken to examine environmental versus load effects on pavements. Pairs of pavement sections were examined at 14 locations in five states. At each location, one section had received normal traffic and the other had never been opened. Visual condition surveys were performed on each section, and pavement condition was compared. It is concluded that traffic loadings are a much more significant cause of pavement distress than are environmental problems. (Author abstract) 8 refs.

**077097 NUMERICAL ASSESSMENT OF PAVEMENT TEST SECTIONS.** A numerical study was performed at the University of Minnesota for the Minnesota Department of Transportation for assessing and explaining the observed performance of several highway pavement test sections. The test sections that were considered in this study are located in Minnesota near Rothsay, on I-94, and near Olivia, on Trunk Highway 71. For the Olivia site, the objective was to investigate the effect of a thin layer of bituminous bond breaker on the reflective cracking of the new pavement slab, whereas for the Rothsay site the goal was to understand the differences between bituminous-treated bases (BTBs), cement-treated bases (CTBs), and aggregate bases in affecting the pavement behavior and to determine the causes for relatively poor behavior of pavements on BTBs as compared to pavements on CTBs and aggregate bases. The approach was to use the finite element method and to perform falling-weight deflectometer (FWD) simulations on the test sections. (Edited author abstract) 22 refs.

**077098 DEVELOPMENT OF A UTILITY EVALUATION FOR NONDESTRUCTIVE TESTING EQUIPMENT USED ON ASPHALT CONCRETE PAVEMENTS.** Nondestructive testing of pavements has become a cost-effective and invaluable aid in determining the actual condition of pavement sections in a highway network. Because the number of nondestructive testing devices in use grows each year, the choice of the best method involves a complex comparison of alternatives involving the test equipment itself, the resulting data, and

the available methods of analyzing the data provided. All of these factors are considered in a systematic way by the application of utility theory. A hierarchical weighting system is developed using nonlinear utility curves. Five generic nondestructive testing devices are evaluated for use on asphalt concrete pavements for both project-level design and network-level planning. (Edited author abstract) 15 refs.

Stoffels, Shelley M. (ERES Consultants Inc, Champaign, IL, USA); Lytton, Robert L. *Transp Res Rec* 1117 1987 p 134-142.

**077099 EFFECT OF LOAD, TIRE PRESSURE, AND TIRE TYPE ON FLEXIBLE PAVEMENT RESPONSE.** The effect of increased truck tire pressures on flexible pavement performance recently has become a subject of great concern. Various researchers have used analytical methods to attribute decreased fatigue life, increased rutting, and accelerated serviceability loss to the effects of increased tire pressure. The study summarized in this article investigated these concerns by measuring the effects of load, tire pressure, and tire type on the response of an asphalt concrete pavement. This experiment was conducted at the Federal Highway Administration's (FHWA's) Pavement Testing Facility (PTF). The relative effects of load and tire pressure on pavement fatigue may be investigated using fatigue equivalency factors which account for both load and tire pressure. Such factors were developed in this study using an exponential relationship between the number of cycles to failure and the magnitude of the tensile strain at the bottom of the asphalt layer. 4 refs.

**077100 DEVELOPMENTS IN THE BRITISH APPROACH TO PREVENTION OF FROST HEAVE IN PAVEMENTS.** In Britain, frost heave is prevented by ensuring that all materials within 450 mm of the road surface are non-frost susceptible as defined by the Transport and Road Research Laboratory test. The evolution of the test is summarized and the implications of the revisions and of other factors in design, such as depth of frost penetration and the availability of water, are examined critically. Results of a series of tests are presented that show that the British frost-susceptible materials correlate with the 'highly frost-susceptible' classification in the United States and French systems. Particle size distribution and saturation moisture content are shown to be poor indicators of the frost susceptibility of aggregates, because neither can reflect the contribution of between-particle and within-particle pore size distributions. (Edited author abstract) 24 Refs.

## Thermal Effects

**077101 CHARACTERIZING TEMPERATURE EFFECTS FOR PAVEMENT ANALYSIS AND DESIGN.** Pavement temperatures can be accurately quantified utilizing the Climatic-Materials-Structural (CMS) computer model developed at the University of Illinois. Required CMS inputs (for temperature modeling) are (a) thermal properties of materials and soils, (b) air temperature data, (c) solar radiation data, and (d) wind velocity data. In this paper the development and use of a comprehensive Illinois Climatic Data Base for Pavements are presented. Air temperature data are summarized on a weekly basis and solar radiation and wind velocity data are presented in the form of a monthly state map. Illustrative, applications-oriented examples are presented for (a) strength-degree-day curing relations for pozzolanic stabilized base materials, (b) asphalt concrete modular-pavement temperature effects, and (c) temperature gradients in portland cement concrete slabs. The emphasis here is on the concepts and techniques used to establish the Illinois Climatic Data Base for Pavements. (Edited author abstract) 14 refs.

## Wear

**077102 LE PROCEDE REGECHAPE. [REGECHAPE Process].** The innovation consists in rejuvenating in situ and in reshaping old wearing courses of bituminous coated materials in the cold state. For this purpose, Beugnet designed: a rejuvenating binder giving to the mixture ageing bitumen plus rejuvenating binder, the properties of a new bitumen; a multifunction machine rejuvenating old coated materials in the cold state and implementing the recycled coated materials. The advantages of this process are: the utilization of materials in situ; the rejuvenation in the cold state and therefore an energy saving; the reshaping of the pavement; preserving the level of pavement; the very competitive costs of the process compared to traditional solutions. (Edited author abstract) In French.

Elie, Denis; Faure, Bernard; Guillon, Roger; Sainton, Alain. *Travaux Suppl* Mar 1988 p 29.

**077103 EFFECTS OF PERMIT AND ILLEGAL OVERLOADS ON PAVEMENTS.** In recent years the nation's highways are wearing out - many of them far earlier than anticipated. One of the causes of premature deterioration is increased traffic, often much more than expected. The volume of truck traffic has increased rapidly as the Interstate Highway System has become available and popular. A serious contributor to early pavement wear-out is the overloaded truck, whether legal or illegal. AASHTO (American Association of State Highway and Transportation Officials) equivalency factors can be used to estimate the effects of overloaded vehicles on pavement damage. Uniform policies among states regarding vehicle size and weight regulations would be beneficial as would uniform policies within a state regarding limits on Interstate highways and other federal-aid highways. Pavement design and evaluation practices should be capable of considering overloaded vehicles. This would require comprehensive traffic data and design procedures that can be used to analyze the effect of identified overloads. Use of weight-in-motion (WIM) equipment and adoption of sampling plans should ensure adequate data collection. (Edited author abstract) 88 refs.

## Wear Resisting

**077104 WEAR RESISTANT CONCRETE FOR PAVEMENTS.** A special test rig that simulates 10 years traffic with 10,000 ADT within one week was used to determine factors that strongly influence rutting resistance in concrete pavement, an important consideration in Norway where studded tires are used throughout the long winter season. These factors include concrete strength, aggregate type, sand type, air entrainment, and condensed silica fume. Tests are continuing to optimize all variables to achieve the highest possible resistance of the lowest cost. (Author abstract). 8 Refs.

Pedersen, Nils. *Concr Int* v 10 n 8 Aug 1988 p 53-58.

**PEAT** See Also COAL LIQUEFACTION; GEOLOGY—Coal; WATER POLLUTION—Water Quality; WATER, UNDERGROUND; WAXES—Magnetic Properties.

**077105 SENSITIVITY OF THE GROUNDWATER MOUND MODEL FOR PREDICTING MIRE TOPOGRAPHY.** The Dupuit-Forchheimer model for groundwater mounds has been proposed to explain the morphology of raised peat mires. This paper discusses the sensitivity of the model as a predictor for mire profiles using data from a raised Irish mire where an attempt was

made to reconstruct the equilibrium profile. The most sensitive parameters are shown to be hydraulic conductivity and net recharge. Detailed measurements of saturated hydraulic conductivity show significant spatial variability, which is correlated with mire stratigraphy. Objective determination of an average value for modeling would have an error band of an order of magnitude which is unsatisfactory for prediction. Net recharge is calculated from the water balance but parameters like overlandflow must be estimated, usually from limited data, making the proposed value suspect. (Edited author abstract) 11 refs.

**077106 STUDIES OF PEAT AS THE INPUT TO COALIFICATION, I. RATIONALE AND PRELIMINARY EXAMINATION OF POLYSACCHARIDES IN PEATS.** It is widely believed that macerals of the huminite and vitrinite groups in coals consist to an important extent of a cross-linked macromolecular network, but the nature of the starting materials for this network, and the manner in which it is formed, are still not satisfactorily settled. In a preliminary study peats in two cores from the Florida Everglades were fractionated by procedures adapted from those used in soil science. Measurements of optical rotation and viscometric molecular weights show that the plant polysaccharides are already altered in surface litter. Acid hydrolysates of whole peat and the humic acid and humin fractions gave distributions of sugars different from what is expected from plant polysaccharides; that is, hemicelluloses and  $\alpha$ -cellulose seem to have been at least partly destroyed and various bacterial and/or fungal polysaccharides added. (Edited author abstract) 51 refs.

**077107 EFFECT OF SURFACTANTS ON PEAT DEWATERING.** The effect of cationic, anionic and neutral surfactants on the mechanical dewatering of a highly decomposed fuel-grade peat has been examined. Surfactant adsorption and zeta potential of the peat particles correlated with dewatering of peat samples. The cationic surfactants had large positive effects on dewatering, the anionic surfactants had a negative effect while the neutral surfactant had no effect. The effects of the surfactants could be explained by charge neutralization and double layer suppression. The cationic surfactants were superior to analogous organic salts because of enhanced interaction by the hydrophobic effect. (Author abstract) 9 refs.

**077108 EVALUATING PEAT-MINING HYDROLOGY USING DRAINMOD.** A process that uses the field-scale model DRAINMOD to simulate the hydrologic response of a watershed to peat mining is presented. An eastern North Carolina watershed has been proposed as the site of a peat mining project. Within the watershed are several distinct soils, land uses, and drainage characteristics. Land use, drainage, and even soil characteristics change as peat soil is mined and reclaimed. The hydrologic response of this watershed is determined for each year of the proposed mining project by combining the field hydrology model with a simple reservoir model, a spreadsheet program, and a statistical program. Study results are discussed. (Edited author abstract). 6 Refs.

## Analysis

**077110 CORRECTION FOR ENVIRONMENTAL  $^{230}\text{Th}$  IN U/Th DISEQUILIBRIUM DATING OF PEAT.** The use of strong acids to dissolve U and Th of organic origin from the sample ashes after combustion causes fractionation and introduction of environmental Th. Resulting unreliable ages most likely relate to the composition of the inorganic fraction and the locality of the sample. U/Th measurements of the .12% NaOH soluble fraction confirm that Th (and possibly U as well) in the mineral fraction is subjected to an in-situ ion-exchange with the organic fraction (humic and fulvic acids), resulting in high concentrations of  $^{232}\text{Th}$  in the organic fraction. Depletion of  $^{230}\text{Th}$  relative to  $^{232}\text{Th}$  in the organic phase for a steady-state is shown mathematically to be determined by the ratio of the half-lives of the isotopes. The consequence is that the correction for environmental  $^{230}\text{Th}$  is not necessary. (Edited author abstract) 10 refs.

## Chemical Analysis

**077113 STUDIES OF THE STRUCTURE OF PEAT HUMIC ACID (III) - STRUCTURAL ANALYSES OF THE PRODUCTS OF REDUCTION OF PEAT HUMIC ACID WITH SODIUM AMALGAM BY  $^{13}\text{C}$ ,  $^1\text{H}$ -NMR SPECTROSCOPY.** Ethanol-soluble reduction products of peat humic acid have been characterized by means of  $^{13}\text{C}$ - and  $^1\text{H}$ -NMR spectroscopic technique. The reduction of peat humic acid with sodium amalgam was carried out in 0.5 N sodium hydroxide aqueous solution at  $100^\circ\text{C}$  for 4hr in a stream of nitrogen. Thus two parts of the ethanol-soluble humic acid and the ethanol-insoluble humic acid were obtained; the total yield of the ethanol-soluble humic acid, namely fulvic acid, in four reductive reactions was 43%. By using the results of  $^{13}\text{C}$ -NMR spectra on a combination with  $^1\text{H}$ -NMR results, the structural parameters such as  $f_{\text{ar}}$ ,  $\text{H}_{\text{ar}}/\text{C}_{\text{ar}}$  and  $\delta$  were calculated. It was concluded that the fulvic acid was obtained by reduction of peat humic acid, the ratio of aromatic carbon atoms to all carbon is about 50%, and the acids have mainly mono-ring systems with a few naphthalene units in the aromatic constitution. (Edited author abstract) In Japanese. 27 refs.

## Classification

**077114 NOTE ON THE CLASSIFICATION OF PEAT.** The difficulties involved in a generally acceptable classification of peat are described. A compromise morphological definition of peat is proposed. 4 refs.

Hobbs, N.B. (Soil Mechanics Ltd). *Geotechnique* v 37 n 3 Sep 1987 p 405-407.

## Compaction

**077115 DEWATERING AND COMPACTION OF WET PEAT BY MECHANICAL METHODS.** The production of fuel peat involves both mechanical and thermal dewatering, and to minimise the operating cost, a high solids content of the pressed cake is important. Since peat is a highly compressible material, the application of pressure and pressure level during the wet pressing operation has a fundamental impact on the dewatering result. It was found that a low initial dry solids content obtained by diluting the peat to form a slurry resulted in a lower final dry solids content. It was also found that the use of polyelectrolytes rendered a final dry solids content comparable to that obtained with no polyelectrolyte added, in spite of the positive effects found regarding the compressibility, filtration resistance and particle size distribution. (Author abstract) 5 refs.

Muenter, M. (Chalmers Univ of Technology, Goteborg, Swed); Gren, U. *Filtr Sep* v 25 n 3 May-Jun 1988 p 180-182.

## Compressibility

**077116 COMPRESSIBILITY PROPERTIES OF A HORTICULTURAL PEAT.** The compressibility of a typical horticultural peat has been studied in the laboratory. Compressibility is an important factor in the processing of this material single volume governs the cost of shipping. The final reconstituted volume and the appearance of the peat after shipping must also be taken into account for marketing. Compression tests have been carried out on a horticultural peat from Newfoundland. Simple equations relating initial water content, relative volume change, and vertical applied pressure are proposed. A fluff factor has been defined, and it was found to decrease with the maximum applied pressure. Finally the results obtained in the laboratory are applied to storage and processing examples that are encountered in the horticultural peat industry. (Author abstract) 4 refs.

Morin, Pierre (Memorial Univ of Newfoundland, St. John's, Newfoundl, Can). *Geotech Test J* v 11 n 1 Mar 1988 p 44-48.

## Dispersions

**077117 INFLUENCE OF DISPERSION ON THE PROPERTIES OF PEAT AND ACTIVE CARBONS.** The influence of mechanical action on peats of different botanical compositions on their dispersion in ball mills and vibromills has been studied. It has been shown that the type of dispersing apparatus and the degree of grinding have an influence on the X-ray structural characteristics, on the content of phenolic hydroxy groups, and on the behavior of the materials on thermal treatment. The mechanochemical degradation of peats undergoing dispersion has considerable effect on the properties of the adsorbents obtained from them. (Author abstract) 15 refs.

Khonyak, V.P.; Mazina, O.I. *Solid Fuel Chem* v 21 n 3 1987 p 78-83.

## Drying

**077118 ARTIFICIAL DEWATERING OF PEAT: PART 2. THE STRUCTURE OF FINNISH PEAT AND ITS INFLUENCE ON WATER RETENTION.** The water-binding properties of peat were studied with six peat samples from two peat production areas in Finland. The samples represented the two main types of Finnish peat, Sphagnum and Carex. The water-retention capacities measured for the samples varied strongly with the dewatering procedure. A direct connection between water-retention capacity and the physical and chemical properties was thus difficult to establish. Pressing without the addition of a flocculant was the most effective dewatering method for low-humidified peats with large mean particle size and low carbon content. The effect of pressing on Sphagnum peat samples could be predicted from the infrared spectra. Medium and highly humidified peats were more effectively dried by water suction, suggesting that the methods may complement each other. If a flocculant is not used, water suction drying would seem to give slightly higher dry peat contents than pressing. (Edited author abstract) 32 refs.

**077119 KEINOTEKOINEN VEDENPOISTO TURPEESTA: OSA 3. MEKAANINEN VEDENEROTUS.** [Artificial Dewatering of Peat: III. Mechanical Dewatering]. The capability of a screen belt press to remove water especially from well decomposed Finnish peat was investigated in this study. The most important result was obtained when well decomposed peat fed as slurry was dewatered by a production-scale mechanical screen belt press with a capacity of 400 kg DS/hm to a moisture content of 30%. This result was obtained by combining several treatments promoting water release, the most important of which were the use of a thick slurry (dry solid content > 10%), the use of an anionic flocculation chemical (dosage < 1 kg/t dry solids) and the preheating of the slurry. It is possible to obtain an even higher capacity without decreasing the dry solid content of the pressing cake, because the velocity of the belt was only 5 m/min. It already approached a commercially profitable pressing process. A dry solid content of 35% was obtained by a high pressure production-scale screen belt press, but the capacity remained at 300 kg DS/hm due to damage to the device. In Finnish. 53 refs.

**077120 CHARACTERIZATION AND QUANTIFICATION OF CHANGES OCCURRING IN THE LOW-SEVERITY DEWATERING OF PEAT.** The rapid passage of peat slurries through nozzles disrupts the ultrastructure of the peat substrate and facilitates solution of key components resulting in changes of hydrophilicity. Improved dewaterability can thus be achieved. Characterization of the chemical changes occurring in peat and the development of a simple yet quantitative procedure to account for dewaterability are discussed in this presentation. The carbohydrate content is used as marker for the

chemical changes. (Author abstract) 8 refs.

## Energy Utilization

**077121 ENERGIAN TUOTANTO TURPEESTA KETJUJEN VERTAILUMENETELMA.** [Energy Production from Peat. Method of Comparing Production Chains]. A method has been developed for comparing energy production chains for research allocation. The method has been applied to comparison of district heating chains (capacity of 3-10 MW) which use peat as fuel. The energy production chains to be compared are on different technical levels: some of them are commercially available and the rest may be in commercial use within 5-20 years. The chains have been planned as operating entities, which has presupposed a choice of activity ranking and compatibility of subprocesses. A comparison is made of the technical characteristics and the price of heat of the various chains. On the basis of this comparison, conclusions are drawn about the problem areas of the energy chains and about the possibilities of further research. In addition, the usability of the method has been evaluated and has been found to be very good. (Edited author abstract) In Finnish. 31 refs.

## Fractionation

**077123 STUDIES OF PEAT AS THE INPUT TO COALIFICATION, II. SAMPLING SITES AND PRELIMINARY FRACTIONATION.** Five investigation sites in the Florida Everglades and Okefenokee Swamp have been selected in which the present vegetational cover includes a gymnosperm and various monocotyledonous and dicotyledonous angiosperms, and cores have been obtained that represent complete profiles from surface to underlying inorganic sediment. Since previous methods of fractionating peat were regarded as unsatisfactory for various reasons, a purely mechanical technique has been used in which organized plant tissue is separated from fine-grained humic matter by slurrying the peat samples in an excess of water and passing the slurry through standard 20 and 80 mesh sieves. (Edited author abstract) 16 refs.

## Geochemistry

**077124 SELECTED PAPERS FROM THE SYMPOSIUM 'PEAT: GEOCHEMISTRY, RESEARCH AND UTILIZATION' (PART OF THE 189TH ACS NATIONAL MEETING).** This conference proceedings contains 12 papers. Individual papers are abstracted and indexed separately. Topics covered include: an overview of peat research, utilization and environmental considerations; early diagenesis of organic matter; microscopic investigation of woody tissues in peats; contributions of plant polymers to coal formation; analysis of wax and resin components from Minnesota peat bog; peat beneficiation; bitumen and wax yields from untreated peats; peat dewatering; atmospheric chemicals deposited on a moun-

tain top peat bog; relationship between peat geochemistry and depositional environments; and comparison of data from a New York mining operation. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 10582 in the Ei Engineering Meetings (TM) database produced by Information Engineering, Inc.

Boron, David J. (Ed.) (Virginia Polytechnic Inst & State Univ, Dep of Mining & Minerals Engineering, Blacksburg, VA, USA). *Int J Coal Geol* v 8 n 1-2 Jun 1987, Sel Pap from the Symp 'Peat: Geochem, Res and Util', Miami Beach, FL, USA 202p.

**077125 RELATIONSHIP BETWEEN PEAT GEOCHEMISTRY AND DEPOSITIONAL ENVIRONMENTS, CRANBERRY ISLAND, MAINE.** The Heath, Great Cranberry Island, Maine, offers a unique locality for studying lateral and vertical relationships between radically different peat types within 1 km<sup>2</sup>. The majority of The Heath is a Sphagnum moss-dominated raised bog. Surrounding the raised bog is a swamp/marsh complex containing grass, sedge, Sphagnum moss, alder, tamarack, and skunk cabbage. Swamp/marsh-deposited peat occurs both around the margins of The Heath and under Sphagnum-dominated peat, which was deposited within the raised bog. A third peat type, dominated by herbaceous aquatics, is presented underlying the swamp/marsh-dominated peat but is not present as a dominant botanical community of The Heath. (Edited author abstract) 11 refs.

**077126 PRELIMINARY STUDY OF THE REFLECTANCE OF HUMINITIC MACERALS IN RECENT SURFACE PEATS.** Mean random reflectances of huminitic macerals were measured from 12 polished microtome sections of surface peats. These peats were collected from a wide variety of depositional and ecological settings, including grass/sedge environments in Florida, Nymphaea (deeper water aquatic) environments in Florida and Georgia, Sphagnum bogs in Minnesota and Maine, and various swamp-forest environments in Florida, Georgia, North Carolina, Minnesota, and New York. At least two (and occasionally as many as 4) distinct subtypes of huminitic macerals were evident in each peat sample. However, for this report all huminitic macerals were grouped into two categories (1) cell walls and cell wall fragments (humotelinites) and (2) cell fillings, secretions, or amorphous masses (humocollinites).

## Microscopic Examination

**077127 MICROSCOPIC INVESTIGATION OF WOODY TISSUES IN PEATS: SOME PROCESSES ACTIVE IN THE PEATIFICATION OF LIGNO-CELLULOSIC CELL WALLS.** The objective of this study is to physically define the processes active on xylem cell walls during peatification. Peatified woody fragments from various depths and environments in southwestern Florida and Okefenokee Swamp were examined microscopically in normal white light, crossed-polarized light, and incident blue light. The examination revealed that three processes were commonly active on woody cell walls during peatification: (1) alteration, (2) degradation, and (3) gelification. Each of these processes is anatomically defined and the optical characteristics of each are used to infer the chemical fate of the major cell wall polymers, cellulose and lignin, during each process. (Edited author abstract) 17 refs.

**Moisture** See COAL—Moisture.

## Moisture Determination

**077128 MEASUREMENTS OF THE EXPLOSIBILITY OF PEAT DUST.** Results from dust explosion tests carried out with peat dust samples are reported. The maximum explosion pressure and the  $K_{St}$  value have been measured, and especially their dependences on the moisture content and mean particle size have been investigated. It is concluded that the maximum explosion pressure and the  $K_{St}$  value of homogeneous dry (moisture content < 35% W/W) and fine (mean particle size < 200  $\mu$ m) peat dust can be estimated with a reasonable accuracy from the moisture content and the mean particle size. For moist (moisture content > 35% W/W) and/or coarse (mean particle size > 200  $\mu$ m) peat dust, it is often possible only to predict whether the dust is explosible or not. (Edited author abstract) 5 refs.

## Pelletizing

**077129 KENTAPELLETTIEN KAYTTO JA KUSTANNUKSET.** [Use and Costs of Field Pellets]. A study was made of the storage, drying and use of peat pellets produced by the field pelletization method. In addition, a technical-economic analysis including a cost evaluation was made of the various stages of the field pelletization method. When storing peat pellets in stockpiles, losses occur due to deterioration of the topmost layer and due to crushing of the pellets. The pile must be covered so that the water vapor which rises to the topmost layer evaporates. Field pellets can be stored in standing silos; this is even cheaper than stockpiling, because no losses will occur. Field pellets can be dried in pellet form, so that they are almost equal to industrial peat pellets. In summer, cool air drying can be used, and the costs will be small. Drying around the year requires a warm-air drier. In small buildings pellets can be successfully burned only by so-called stoker burners. With these burners, however, it is possible to obtain only half the power attainable from burning dry pellets, because field pellets must stay longer at the grate than drier pellets, due to the drying process. An under feed coal-stoker is suitable, as is, for the combustion of field pellets in larger buildings. Ash removal from the boiler must be mechanical. A mechanical grate suitable for combustion of sod peat does not work well with field pellets. The ash melts into a thick layer on the grate and must be removed manually from time to time. 3 refs. In Finnish.

## Processing

**077130 TECHNO-ECONOMIC ASSESSMENT OF HIGH-PRESSURE PEAT LIQUEFACTION.** This study is part of a research program, the aim of which is to identify the most promising process concept for the conversion of peat into transport fuels by high-pressure liquefaction. The study consists of technico-economic assessments of a base-case concept and of four sensitivity-case concepts. The products are heavy primary oils which require further upgrading into transport fuels. The designs of the processes were based on data generated in bench-scale experiments. The main results of the economic evaluation of the base-case concept are presented in terms of costs in US dollars as of mid-1985. On the basis of the results of the sensitivity studies it was concluded that thermal drying of milled peat, prior to liquefaction, is advantageous; that the concentration of peat in the feed slurry should be limited to about 30 wt% solids; that operating pressures lower than 20 MPa should be sought; and that the economics of the process are not sensitive to

the chosen method of separating solids from the product stream. A preliminary estimate of the costs of upgrading the primary product into gasoline was also made. Gasoline production costs in the range 10 - 12 USD/GJ were obtained for the base case. This is a promising result, particularly when the Finnish refinery price (exclusive of taxes) is used as a reference. (Edited author abstract) 20 refs.

**077131 PEAT BENEFICIATION BY WET CARBONIZATION.** A comprehensive study of the effects of operating conditions on the wet-carbonization characteristics of Minnesota peat was conducted. Tests were conducted in a 360-kg/h continuous process research unit. The effluent process water was treated by IGT's two-phase anaerobic digestion process for energy recovery. This process maximizes the production of methane and minimizes hydraulic retention times in the digesters. An integrated wet-carbonization process to produce a solid peat fuel with energy and by-product recoveries from the liquid effluent streams has been developed. This paper discusses the work accomplished in this study. (Edited author abstract) 3 refs.

**077132 BITUMEN AND WAX YIELDS FROM WET-CARBONIZED, HYDROLYZED AND UNTREATED PEATS.** A reed-sedge peat from Northern Minnesota was used to determine the effects of hydrolysis and wet carbonization on the yield and quality of peat waxes extracted with various solvents. The purpose of the study was to evaluate the potential for producing commercial waxes from Minnesota peat and the possibility of combining peat waxes and fuel processes. Air-dried peats extracted with five different solvent systems yielded total bitumens of 1.4 to 7.1 wt.% of the dried peat and waxes ranging from 1.1 to 4.7%. Hydrolysis and wet carbonization of peats prior to bitumen extraction resulted in yields which increased by factors of 2-3 $\times$ . In general, polar solvents gave higher yields than nonpolar solvents, but the wax melting points and acid values were higher with polar solvents. Bitumen extraction reduced the energy values of residual peat solids by 10-15%. (Author abstract) 10 refs.

## Production

**077133 RAKEISEN TURVETUOTTEEN OMINAISUUDET JA TUOTANNON PERUSTEET.** [Properties and Principles of Production of a Granulated Peat Product]. The aim of this research project was to make milled and sod peat production methods more similar. In this way weather dependence could be reduced and better shrinkage properties achieved. The basic techniques of production and the properties of the granular peat product were studied. The methods employed are derived from modern milled and sod peat production, field granulation and pelletizing methods. Some new laboratory and field research equipment had to be developed and manufactured. These tools were used in experiments when searching for the best methods and technologies for harvesting peat. In all of the tests of various methods and techniques those technical parameters by means of which it was possible to make granules from different types of peat were determined. The properties of granules made by all of these methods were quite similar to each other and to the properties of sod peat. Therefore, in principle, any of the tested methods could be the basis for the future planning of actual field equipment. (Edited author abstract) In Finnish. Refs.

**Pyrolysis** See Also LIQUID FUELS—Production.

**077134 FLASH-PYROLYSIS OF PEAT, WOOD, BARK AND LIGNIN: PART 2. PYROLYSIS TEST WITH FINNISH PEAT AT THE UNIVERSITY OF WATERLOO.** This publication deals with flash pyrolysis tests carried out with Finnish Peat in fluidized bed reactors at the University of Waterloo, Canada. A bench-scale unit (10-100 g/h) was the main tool in this test program. In one experiment a larger (pilot) unit (1-3 kg/h) was employed. The main objective of the work was to investigate the effects of temperature (range 450-750°C), reactive atmosphere (nitrogen, methane), and gas-phase residence time (0.30-1.00 s) on the organic liquid yields. The pilot run was done at near optimal conditions to produce a larger quantity of organic liquid. The highest yield of recovered organic liquids, about 50 wt-% of moisture- and ash-free raw material, was found at 450-475°C. The organic liquid yield decreased quickly in favor of gaseous components, such as carbon monoxide and hydrocarbons. The maximum yield of light olefins was found to be about 10 wt-% at the highest temperature employed (750°C). Methane was an inert reaction gas in the conditions of these tests. The total recovery of pyrolysis products was excellent, typically 98-100%. (Edited author abstract) 9 refs

Piskorz, Jan (Technical Research Cent of Finland, Finl); Scott, Donald S.; Westerberg, Ian B.; Arpiainen, Vesa. *Valt Tek Tutkimuskeskus Tutkimuksia* 507 Oct 1987 36p.

**077135 FLASH PYROLYSIS OF PEAT IN A FLUIDIZED BED.** It is shown that high yields of oil can be obtained from a good quality peat by fast pyrolysis in an atmospheric pressure fluidized bed reactor. Maximum oil yields were obtained at about 500°C with an apparent vapor residence time of 0.5 seconds or less. At these conditions, on a m.a.f. basis, yields of tar were about 47-50%, gas about 13%, char 28-32% and product water about 12%. The atomic H/C ratios of both char and tar tended to decrease as temperature increased. Oxygen content of the oil decreased also with temperature and was about 24% at optimum conditions. The pyrolysis oil from peat can probably be used successfully as a substitute fuel oil, or possibly converted to higher quality fuels. (Author abstract) 6 refs.

Scott, Donald S. (Univ of Waterloo, Waterloo, Ont, Can); Piskorz, Jan; Westerberg, Ian B.; McKeough, P. *Fuel Process Technol* v 18 n 1 Mar 1988 p 81-95.

**077136 STUDY OF THE FATE OF PLANT POLYMERS IN PEATS BY CURIE-POINT PYROLYSIS.** Four cores of peat from the Florida Everglades and one from the Okefenokee Swamp, Georgia, have been studied to clarify the roles of plant polymers as input to coalification. Curie-point pyrolysis/mass spectrometry with multivariate statistical analyses, supplemented by Py/GC and Py/GC/MS, revealed differences in chemistry between peats derived from different types of plants. Some  $\alpha$ -cellulose is presented in the upper levels of the peats, but the polysaccharide content decreases markedly with depth. Pyrolysis products contain many phenolic structures related to lignin monomers, the distribution of which changes with depth and in peat fractions of different particle size. The results demonstrate that the pyrolysis techniques are indeed valuable means of studying structural features of peats. (Edited author abstract) 26 refs.

**077137 PYROLYSIS AND COMBUSTION OF PEAT AND WOOD AS SINGLE PARTICLES AND AS A LAYER.** This work was carried out in order to characterize the burning and emission properties of peat and wood in grate combustion simulators to assist the development of grate-based burners by improving air feeding. Scandinavian peat and wood give higher yields of volatile products and generally contain less inorganic matter and sulfur than coals of various grades. The nitrogen content can be high in peat (up to 3% by weight). Moreover, the moisture content of wood and extruded peat varies over a wide when burned. Pyrolysis experiments with three peat types indicated that the concentration of nitrogen in the solid residue increased between 573 and 773 K. The burning rate was sensitive to changes in oxygen content at low temperatures and the evolution profiles of NO and CO<sub>2</sub> were very similar during flame combustion in the reactor for single particle combustion, which simulated a single fuel particle moving on a grate. 13 refs.

Aho, Martti (Technical Research Cent of Finland, Jyväskylä, Finl). *J Anal Appl Pyrolysis* v 11 Oct 1987, Proc of the 7th Int Symp on Anal and Appl Pyrolysis, Reading, Engl, Sep 15-19 1986 p 149-162.

## Research

**077138 OVERVIEW OF PEAT RESEARCH, UTILIZATION, AND ENVIRONMENTAL CONSIDERATIONS.** The peat reserves in this country represent a vast resource for fuel and for chemical feedstock. As a fuel for combustion, peat generally has a low to moderate sulfur content (0.5-3.0% on a dry basis), a low to high ash content (5.0-20% on a dry basis), and an intermediate Btu content (6,000-10,000 per pound on a dry basis). As a chemical feedstock, peat can be extracted to provide various aliphatic, cyclic, and aromatic compounds, particularly oxygenated derivatives of these. Because of its chemical structure, peat provides a suitable feedstock for gasification not only for energy production but also for the synthesis of more complex compounds. The objective of this study is to provide some background information on peat and to overview select research, utilization, and environmental considerations involving peat. (Edited author abstract) 71 refs.

Boron, David J. (Virginia Polytechnic Inst & State Univ, Blacksburg, VA, USA); Evans, Earl W.; Peterson, Jeffrey M. *Int J Coal Geol* v 8 n 1-2 Jun 1987, Sel Pap from the Symp 'Peat: Geochem, Res and Util', Miami Beach, FL, USA p 1-31.

**077139 EARLY DIAGENESIS OF ORGANIC MATTER IN A SAWGRASS PEAT FROM THE EVERGLADES, FLORIDA.** The transformation of plant biopolymers to humic substances in peats during early diagenesis is a critical but poorly understood step in the formation of coal. This paper presents results concerning the structural interrelationships among various fractions of the organic matter in peat and the dissolved organic matter in the pore water from a site in The Everglades, relying primarily on elemental analysis and <sup>13</sup>C nuclear magnetic resonance for structural elucidation. Our goal was to obtain some insight into the sequence of steps involved in the formation of humic substances. Results show that the major change occurring in the whole peat during diagenesis is loss of carbohydrates. The components of the peat which are more resistant to microbial degradation become concentrated in the humic fraction. (Edited author abstract) 45 refs.

**077140 ANALYSIS OF WAX AND RESIN COMPONENTS FROM MINNESOTA PEAT BOG.** A peat sample from a Minnesota (St. Louis County) bog was examined for waxy and resin components by extraction with petroleum ether (35-60°), chloroform and ethyl acetate. The waxy solids were separated from the resins by crystallization from methanol at 0°C. A sample of wax was

saponified with 0.5 N NaOH for 4 h. Wax, resin, unsaponified and saponified fractions were analyzed with a Hewlett-Packard Model No. 5995 MS/GC/DA system equipped with a fused-silica capillary column, internally coated with SE-30. All fractions contained C<sub>21</sub> through C<sub>27</sub> alkanes, n-alcohols, straight-chain fatty acids, phenolic acids, polynuclear aromatic hydrocarbons and triterpenoids. Many of the compounds isolated and identified have not been previously reported in peat analyses. (Author abstract) 10 refs.

## Sampling

**077141 DISTRIBUTION OF BASE METALS IN PEAT NEAR A SMELTER AT FLIN FLON, MANITOBA.** Peatlands were sampled within 250 km radius of Flin Flon, Manitoba where a smelter was a source of base metals in particulate emissions. Increased Zn, Pb, Cu, and As concentrations were found in the surface peat up to 100 km from the source, decreasing exponentially away from the source. The upper part of the peat deposits is enriched with base metals. The vertical distribution pattern in the peat suggests in situ accumulation of base metals with little or no downward translocation. (Author abstract) 18 refs.

## Specific Heat

**077142 EXPERIMENTAL STUDY OF THE TEMPERATURE DEPENDENCE OF THE EFFECTIVE HEAT CAPACITY OF PEAT.** A study has been made of the temperature dependence of the effective specific heat capacity of organic sorbents (peats of different composition and properties). The characteristic features of the phase transitions of free and bound moisture in the material have been established over the temperature range of 223 to 313°K. Examination of the results shows that the behavior of all the curves of the experimental dependence of the effective specific heat capacity of peat on the temperature is similar for all moisture contents. For the water-saturated samples of the lowland sedge-hypnum, pine-cotton-grass highland, and lowland sedge peats over the temperature range 268-273°K sharp maxima are observed on the heat capacity curves that reach values of 68, 24.5, and 40 kJ (kg·K), respectively. (Edited author abstract) 11 refs.

Gamayunov, N.I. (Kalinin Polytechnic Inst, USSR); Krykanova, O.N.; Stotland, D.M. *Colloid J USSR* v 49 n 1 Jan-Feb 1987 p 111-115.

## Spectroscopic Analysis

**077143 CHARACTERIZATION OF PEAT SAMPLES BY DIFFUSE REFLECTANCE FT-IR SPECTROSCOPY.** A Fourier transform infrared spectroscopic study of Sphagnum peat, Carex peat, and mixtures of these peat types is reported. Intensity values from selected wavenumber regions of the infrared spectra were correlated with calorific value, degree of decomposition, carbon, and nitrogen content, and content of amino acids and amino sugars, with the use of the method of partial least-squares modelling with latent variables (PLS). The application of this method is shown to give valuable information about properties of peat which have no easily measured quantitative relationship to the infrared spectrum. (Author abstract) 35 refs.

Holmgren, Allan (Univ of Umea, Umea, Sweden); Norden, Bo. *Appl Spectrosc* v 42 n 2 Feb 1988 p 255-262.

## Surface Properties

**077144 SURFACE AND COLLOID CHEMISTRY OF PEAT AND PEAT DEWATERING. ELECTROSTATIC EFFECTS.** A study of the potentiometric titration and metal ion binding properties of peat is reported. Peat is found to behave as a typical polyelectrolyte system which, especially at higher pH, can be very highly charged. For the analysis of potentiometric titrations, a theoretical model is developed. The electrostatic potential on the surface is calculated using the Poisson-Boltzmann equation. (Edited author abstract) 18 refs.

Andreasson, A. (Univ of Lund, Lund, Sweden); Jonsson, B.; Lindman, B. *Colloid Polym Sci* v 266 n 2 Feb 1988 p 164-172.

## Testing

**077145 PHYSICAL PRINCIPLES OF AN IR PEAT WATER-CONTENT METER.** The author examined cut peat of upland and lowland types with degrees of decomposition R from 5 to 45%, absolute water contents W from 0.2 to 5 kg/kg, and weighted-mean particle diameters d from 0.25 to 17.5 mm. They ranged in wavelength λ from 0.4 to 2.5 μm. The spectral reflectivity Rλ was measured with a SF-4A spectrophotometer. A difference from existing IR water-content meters is that in this study multiwave IR methods are used. Water contents are measured with these instruments as follows: The specimen is exposed to an integral IR flux. The long-wave limit corresponds to the maximum wavelength that can be recorded by the FSA photoresistors used in these instruments, while the short-wave limit is the upper end of the visible region. The reflected IR radiation provides information on two phases. Then the same specimen is exposed to IR radiation previously passed through a filter, which is a cylindrical cell transparent to the IR filled with a thin layer of water (1-2 mm). The reflected signal then provides information only on the solid phase, since the IR radiation that interacts with the water is cut off. The ratio of the two IR fluxes gives the water content. The main advantages of this method are that no contact is required, the throughput is high, recalibration is rapid, and the readings are independent of the poured density and temperature. 11 refs.

**077146 COMPARISON OF BULK AND ELUTRIATE TEST DATA FROM A NEW YORK PEAT MINING OPERATION: LEACHABILITY OF SELECTED TRACE ELEMENTS.** Bulk and elutriate test data from 43 depth-composited cores in 3 New York, USA, peat deposits are compared in order to evaluate the leachability of 11 metals under simulated stormwater runoff conditions. Synthetic rain water was used to simulate the type and quality of water which interacts with the peat during stockpiling and mining operations. Bulk analysis data revealed elevated concentrations of chromium, iron, lead, and manganese in the peat deposits. Elutriate test data indicates that iron and manganese are easily leached and may be mobile under the proposed site drainage plan. (Edited author abstract) 13 refs.

## Thermal Effects

**077147 THERMAL DEWATERING OF CHATHAM ISLANDS PEAT.** The utilisation of the waxy peat deposits on the Chatham Islands as a synchrone resource through char pyrolysis would require the removal of large quantities of water. Conventional methods of dewatering by pressing followed by thermal drying are likely to be uneconomical. The most attractive alternative method investigated so far is the Evans-Siemon process, which involves liquid-phase removal of moisture under pressure at a temperature of order 250°C. The required moisture

level of 0.1 kg/kg or lower was achieved by heating a sample of moorland peat for 13.5 min at a temperature of 250°C and allowing the peat to cool with the minimum of reabsorption of moisture liquid. (Author abstract) 11 refs.

## Thermodynamics

**077148 WET PEAT POWER PROCESSES: A THERMODYNAMIC STUDY.** The efficiencies of four power processes for wet peat have been studied. These include gas turbine cycles, steam power cycles, and combinations thereof. It is concluded that wet peat can be used in power processes with reasonable efficiency. The paper suggests that wet peat power processes could be cost competitive relative to conventional power production. (Author abstract) 6 refs.

**077149 ON CHELOMEY'S PENDULUM.** In 1983, a study was published of the effect of high-frequency actions on various mechanical and elastic systems. In particular, a mechanical vibrational system with two degrees of freedom was investigated which consisted of a straight rod and a ring pulled over the rod with a small clearance. The ring could move freely along the rod. The author demonstrated experimentally and by direct computer calculations that the effect of high-frequency vibrations at the hinge base of the rod could generate its overturned position in which the ring on the axis of the rod would be in a state of dynamic equilibrium. The rod would perform small, practically imperceptible vibrations relative to the system's vertical axis. This effect was discovered and described by V.N. Chelomey, a member of the USSR Academy of Sciences. This mechanical system is thus referred to as Chelomey's pendulum. (Author abstract) 6 refs.

Kurbatov, A.M.; Chelomey, S.V.; Khromushkin, A.V. *Mech Solids* v 21 n 6 1986 p 58-60.

**077150 MOTIONS OF A PLANE PHYSICAL PENDULUM WITH AN ELASTIC SUSPENSION.** The paper studies the motions of a shaft (or a plane physical pendulum) in elastic bearings in the neighborhood of the stable equilibrium position, making use of the results of studies by V.M. Starzhinskii and correcting for the gravity force. (Edited author abstract) 5 refs.

Blinov, A.P. *Mech Solids* v 22 n 1 1987 p 45-49.

**077151 MECHANICAL SYSTEM - THE PENDULUM.** The purpose of this paper is to analyze graphically the motion of pendulums. In order to do this, we have used an interactive digital computer program developed at Florida Institute of Technology which simulates an analog computer. 2 refs.

**077152 RESONANCE INTERACTION WITH RETARDATION BETWEEN A PENDULUM AND AN EXCITATION MECHANISM.** Oscillation (fundamental parametric resonance) of a pendulum with vertical vibration of its suspender induced by an electric motor with limited power. In addition to resonance interaction, we will account for variable retardations of the pendulum and the medium. Two classes of steady-state conditions are obtained and their stability is investigated. An analysis of the effect of retardations on the dynamics of the system is carried out.

Krasnopol'skaya, T.S. (Acad of Sciences of the Ukrainian

SSR, Kiev, USSR); Shvets, A.Yu. *Sov Appl Mech* v 23 n 2 Feb 1987 p 179-185.

**077153 PENDULUM WITH SUPPORT IN CIRCULAR ORBIT.** The equation of motion of a pendulum whose support is in steady circular motion is a nonlinear variation of the Mathieu form which, when linearized, becomes a nonhomogeneous Mathieu equation. For high support speeds, when the pendulum oscillates about rotating radial lines, a model of a mechanical shredder may be constructed. At low speeds, the pendulum oscillates about the vertical position, and the familiar ferris wheel may be simulated. With the aid of the symbolic program Macsyma, exact and perturbation solutions to the linearized equation are obtained over the entire stable region. A perturbation solution by the method of multiple scales is obtained for the nonlinear equation, from the high-speed range of practical shredder design to the transition range when oscillations about radial lines become unstable. (Edited author abstract) 10 refs.

**Applications** See Also NUCLEAR REACTORS—Measurements.

**077154 RING-SHAPED DAMPER OF NUTATION MOTION OF A ROTATING BODY.** It is known that many objects have at least one body axis stabilized in space. The most natural method of stabilization of an axis is steady rotation of the body around the selected symmetry axis. Due to the gyroscopic effect, the body becomes more resistant to the action of external moments. From the point of view of minimum power consumption, such a method of stabilization is the most preferable one especially at prolonged rotations. The author presents details of damping mechanisms which can be useful for designing such devices. 4 refs.

Gavrikov, V. *Vib Eng* v 1 n 1-4 1987 p 245-250.

## Control

**077155 ANWENDUNG VON KONTROLL-STOER-GROESSENBEOBACHTERN ZUR REGELUNG UND ZUR KOMPENSATION TROCKENER REIBUNG.** [Application of Control Disturbance Observers for the Control and Compensation of Dry Friction]. In this paper an application of disturbance observers for the control and disturbance compensation of the laboratory model 'inverted pendulum' is described. The dry friction of the pendulum sliding carriage is viewed as disturbance variable, which causes an undesirable large limit cycle and must therefore be compensated. The disturbance observer is realized as a control observer. The experimental results are presented and discussed. (Author abstract) 8 refs. In German with English abstract.

Bakri, N.; Becker, N.; Ostertag, E. *Automatisierungstechnik* v 36 n 2 Feb 1988 p 50-54.

## Control Systems

**077156 DESIGN AND SIMULATION OF CONTROL SYSTEMS OF AN INVERTED PENDULUM.** This is a preliminary study to provide useful information for the design of the control of a monocyclus which is one of the intelligent movable robots. In this paper, the two-degree-of-freedom monocyclus is modeled by an inverted pendulum with a controlling arm pivoted at its upper end. The controlling arm is rotated to give the pendulum restoring moment. The feedback control systems for the model have been designed using two methods - the pole assignment and the optimal control, respectively. Simulations of the control systems designed with the above methods are carried out on a personal computer. Although the pendulum can be stabilized with either of these methods, it is found that the optimal control method is superior to the pole assignment one, because in the former the control system can be designed to be suitably corresponding to the design demands based on definite

criterion. (Author abstract). 7 refs.

## Mathematical Models

**077157 DAMPING AND NOISE TEMPERATURE OF TORSIONAL MICROPENDULUMS.** For torsional micropendulums with a quartz suspension thread of diameter 1-10  $\mu\text{m}$ , the laws of Q-factor variation as a function of the fiber diameter, frequency, temperature, and other parameters are deduced; the noise temperature of the pendulum is measured from the amplitude fluctuations of the oscillations. (Author abstract) 6 refs.

Mitrofanov, V.P.; Ponomareva, O.I. *Moscow Univ Phys Bull* v 42 n 5 1987 p 26-30.

**Oscillations** See Also OSCILLATORS—Variable Frequency.

**077158 SELF-EXCITED OSCILLATORY INSTABILITIES AND SKEW-SYMMETRIC COUPLING.** Non-conservative, position-dependent forces - called 'follower forces' by some - are common in mechanical systems but not easily identified or distinguished from potential forces by the novice, whether physically or analytically. Their physical effect in inducing self-excited vibration is especially difficult to visualize. A very simple, articulated pendulum is described, upon which is impressed a follower force, providing an intuitive illustration of how such a force modulates the vibratory response of the pendulum. A linear analysis is provided, too, which highlights the symmetry properties of the equations of motion of such systems, the special couplings which allow self-excitation, the unpredictable influence of damping, and the essential energy modal relationships which govern the existence of self-excitation. (Edited author abstract) 8 refs.

Crisp, John D.C. (Cambridge Univ, Engl). *Int J Mech Eng Educ* v 15 n 2 Apr 1987 p 71-90.

**077159 KAOITICNO NIHANJE FROUDOVEGA NIHALA.** [Chaotic Movement of Froud's Pendulum]. The paper describes an example of the development of chaotic movement in a system consisting of an electrically driven rotor and a pendulum which is coupled to it by a friction clutch. The solutions of the corresponding nonlinear system of motion equations are unstable. They are determined numerically and characterized by spectral distributions and by the dimensionality of the corresponding attractor. (Edited author abstract) 9 refs. In Slovenian.

## Stability

**077160 ON THE STABILITY OF QUASI-EQUILIBRIUM POSITIONS OF CHELOMEY'S PENDULUM.** A study published in 1983 described a paradoxical effect observed in experiments with systems containing vibrating elements. One of these effects is the hanging of a ring on a pendulum, built as a rod hinged to a vibrating base when the pendulum assumes a vertical position. In other papers the existence and stability conditions of such quasi-equilibrium positions were formulated; the pattern of these points was additionally analyzed. The present study makes an analysis of these conditions derived in a different way it also considers the case of several rings placed on the rod. (Author abstract) 3 refs.

Kirgetov, A.V. *Mech Solids* v 21 n 6 1986 p 52-57.

**077161 STOCHASTIC STABILITY OF A GYRO-PENDULUM UNDER RANDOM VERTICAL SUPPORT EXCITATION.** The mean square stability of a gyropendulum under random vertical support excitation is considered. The intensity and the correlation time of the stochastic excitations are assumed to be small in order to

obtain approximate analytical results. The stochastic averaging procedure of Stratonovich and Khasminskii is used to establish the drift and diffusion coefficients in the corresponding Ito equation. Explicit results are obtained for stochastic stability boundaries. (Author abstract) 18 refs.

## PENSTOCKS

### Design

**077162 ZUR FRAGE DER BEMESSUNG VON DRUCKROHRLEITUNGEN AUFGRUND VON TRANSIENTEN VORGAENGEN UND NICHT-TRANSIENTEN BETRIEBSZUSTAENDEN.** [Contribution to the Problem of Penstock Design Based on Transient Processes and Non-Transient Operating Conditions]. After discussing the basic principles, the author first explains the conventional method of penstock design based on a design piezometric line, which is then determined for the penstock of a hypothetical power station. After explaining the hydraulic impedance method, the author examines the potential resonance risks from unstable control, applying the explained numerical method as well as a simulation study. It is seen that the penstock is subjected to a continuous stress of some 90 percent of the design pressure, with the number of load cycles that may be reached within a period of 5 years being as much as 2 million. In the light of this penstock designers should to the conventional water hammer analysis and the purely static design based on it. In German. 10 refs.

Fasol, K.H. *OZE Oesterr Z Elektrizitaetswirtsch* v 40 n 3 Mar 1987 p 113-114, 115-119.

### Vibrations

**077163 VIBRATIONS IN PENSTOCKS.** In spite of the fact that no international standards exist for the limits of penstock vibration, potentially dangerous vibrations can always be recognized. However, finding the source is not always possible, and in any case, it cannot always be eliminated. Detailed analysis is required to find the fundamental exciting frequency, to help identify the exciting source. Often the only solution is to modify the natural frequency of the system, as illustrated in the case study, describing experience at an Indian hydro plant. It was found that the severe penstock vibration was being caused by self-excited pressure waves, the elimination of which required either a change in length and/or diameter of the penstock, or interconnection of the penstocks, which was not considered to be feasible. The problem required structural modification of the system, as well as reinforcement of the penstocks with ring stiffeners. (Edited author abstract) 5 refs.

**077164 INFILTRATION JOINING PROBLEM.** Since the 1950s there has been continuing interest in the problem of joining the intermediate-time series solution for one-dimensional infiltration and the large time traveling wave solution. In practical field terms, however, observational errors, and errors produced by minor heterogeneities and nonuniformities of initial moisture content, will be far larger than the errors of even the crudest joining technique. The practical problem thus

warrants only the minimum number of parameters and maximum simplicity. For soils which are initially relatively dry, two parameters suffice, and these are ideally taken as the physically meaningful and measurable sorptivity  $S$  and hydraulic conductivity  $K_f$ . Polynomial fractions are unsuitable; piecewise representation is simple and adequate for most purposes, but a technique using the Knight infiltration solution of J.M. Burgers' equation gives greater accuracy. It is well suited when a continuous representation and/or accuracy is desired (Author abstract) 23 refs.

Philip, J.R. (CSIRO, Canberra, Aust). *Water Resour Res* v 23 n 12 Dec 1987 p 2239-2245.

**077165 INFILTRATION CAPACITY OF DISTURBED SOILS: TEMPORAL CHANGE AND LITHOLOGIC CONTROL.** Reconstructed soils on surface mines (minesoils) of different age (1 to 4 years old) are used to investigate infiltration rates on disturbed landscapes. The data consist of soil/surface properties and runoff volumes fit to the Horton infiltration equation. Infiltration rates on newly reclaimed minesoils are an order of magnitude lower than adjacent, undisturbed soil. Multiple regressions are used to explore relationships between infiltration parameters and soil/surface properties for each soil age. Regression models of 30-min infiltration volume and the steady-state rate consistently include the percent silt and clay, slope, and bulk density, and vegetation. Mean infiltration volumes at different mines are equal in the first year following reclamation, but become significantly different with surface age. The magnitude of the increase is controlled by the soil texture, vegetation, slope, and bulk density. (Edited author abstract) 30 refs.

Jorgensen, David W. (Colorado State Univ, Fort Collins, CO, USA); Gardner, Thomas W. *Water Resour Bull* v 23 n 6 Dec 1987 p 1161-1172.

**077166 EVALUATING THE EFFECT OF PUDDLING ON INFILTRATION USING THE GREEN AND AMPT EQUATION.** After exposure to several different initial rainfall durations and rainfall sequences, the constant-head cumulative infiltration of water into disturbed Hagerstown slit loam Ap horizon soil samples of two aggregate sizes was measured. The Green-Ampt equation was fit to the cumulative infiltration data to yield hydraulic conductivity and capillary suction parameters. The conductivities and suction values obtained were unique and characteristic of the flow process for all treatments containing a surface puddle or partial surface puddle caused by rainfall energy. The infiltration responses to rainfall of 0 to 20 min duration showed that the hydraulic conductivities decreased from 576 mm/h for the no rain treatment to 5.4 mm/h for the coarse aggregates receiving 20 min of rain. For all treatments the capillary suction was very small. Flow through the surface puddle was controlled by the very thin surface layer of partially broken aggregates and primary particles. Additional study results are discussed. (Edited author abstract) 22 Refs.

### Measurements

**077167 COMPARISON OF INFILTRATION MEASURING METHODS FOR SURFACE IRRIGATION.** Several methods for measuring the rate of infiltration in a volcanic ash soil are compared on the basis of field measurements. Methods that use stagnant water give lower values of soil infiltration rate than those that use flowing water. The performances of the Kostikov and the modified Kostikov infiltration equations are analyzed for seven methods. These equations closely match field data

collected with each technique used. Functional relationships among the infiltration rate equations are also obtained for each method of infiltration. (Author abstract) Refs.

Holzappel, Eduardo, A. (Univ of Concepcion, Chillan, Chile); Marino, Miguel A.; Valenzuela, Alejandro; Diaz, Francisco. *J Irrig Drain Eng* v 114 n 1 Feb 1988 p 130-142.

**077168 INFLOW-OUTFLOW INFILTRATION MEASUREMENT ACCURACY.** Furrow infiltration and channel seepage are often measured with inflow-outflow measurements. Inaccuracy in the flow measurement will cause a larger uncertainty in the calculated infiltration. The infiltration rate determination uncertainty increases rapidly as the percent of the inflow that is infiltrated decreases. The effect of measurement uncertainty on infiltration measurements can be estimated so that the confidence interval of a mean or the actual infiltration variability level can be determined. (Author abstract) 7 refs.

**Models** See FLOW OF FLUIDS—Porous Materials.

### Prediction

**077169 PREDICTING INFILTRATION PARAMETERS FOR A ROAD SEDIMENT MODEL.** Methods for predicting Green-Ampt infiltration parameters for very coarse-textured soils are not well established. Before accurate runoff and erosion predictions can be made for these soils, a large data base and correlations to other soil properties are required. Runoff data were collected and infiltration parameters were determined for simulated rainfall events on forest roads. These results were combined with data from similar studies, and predictive equations were established for the Green-Ampt infiltration parameters using soil texture and porosity. The equations account for 70% of the variation in hydraulic conductivity and 88% of the variation in capillary suction head. (Author abstract) 17 refs.

**077170 WIDE RANGE PERMEAMETER FOR USE IN ROCK PHYSICS.** An apparatus was designed which was capable of measuring about 8 orders of magnitude in permeability under high confining pressure. A first version of this permeameter was built in 1981 and used for synthetic rocks (hot-pressed quartz and calcite) prepared in the laboratory to different porosities; permeability ranged from  $10^{-15}$  to  $10^{-20}$  m<sup>2</sup>. To extend this work to even less permeable samples, a second, more elaborate version capable of permeabilities as low as  $10^{-22}$  under pressures up to 200 MPa was built. The upper limit is around  $10^{-14}$  m<sup>2</sup>. This new system also enabled the pore volume changes to be measured. 8 refs.

## Flammability

**077172 EVALUATION OF THE DEFLAGRATION HAZARDS OF ORGANIC PEROXIDES BY THE REVISED TIME-PRESSURE TEST.** The revised Time-Pressure test has been applied to organic peroxides to evaluate their deflagration hazards. Liquid organic peroxides were also tested successfully using a firing method with a fusehead. The results show that the ignition sensitivity and the violence of deflagration can be obtained from the amount of igniting material giving the apparent maximum rate of pressure rise, and its maximum rate, respectively. From an evaluation of the deflagration hazards of many types of organic peroxides, it is also shown that the ignition sensitivity and the violence of deflagration for each organic peroxide may have a tendency to increase with increasing active oxygen content among the same type of organic peroxide, with a few exceptions and that the ignition sensitivity and the violence of deflagration for each type of organic peroxide may decrease in the following order, given the same active oxygen content: diacyl peroxides > peroxyesters > dialkyl peroxides > hydroperoxides. (Author abstract) 11 refs.

## Research

**077173 ROLE OF SEGMENTAL MOBILITY AND LOW-MOLECULAR MASS RADICALS IN THE ANNIHILATION OF POLYPROPYLENE PEROXIDE MACRO-RADICALS.** Electron paramagnetic resonance has been used to study the kinetics of annihilation of peroxide macro-radicals, formed from isotactic polypropylene, and the effect on the annihilation process of additions to the polymer matrix of low-molecular mass solvents and tert-butyl hydroperoxide. The molecular mobility of a nitroxyl radical has been studied under the same conditions and the bimolecular constant for the rate of contacts has been compared with the constant for the annihilation of peroxide macro-radicals. It is shown that the process of annihilation of macro-radicals is determined by segmental mobility together with the 'relay-race' transfer of the valency. (Edited author abstract) 24 refs.

**077176 ERHOEHUNG DER BEREITSCHAFT DER LEITER IN FORSCHUNG UND ENTWICKLUNG ZUR ANWENDUNG VON LEISTUNGSEINSCHAEZTUNGEN.** [How to Increase the Readiness of Research and Development Department Heads to Evaluate Performance Results]. According to the investigations carried out by the authors, certain means of work have to be provided for the heads, which are in agreement with the specific demands of Research & Development. Further, it is required to include self-appreciations of the researchers increasingly and to evaluate the activity of the heads themselves both periodically and convincingly, as well as to connect the performance estimation with material incentives in a more efficient manner. (Edited author abstract) In German. 4 refs.

**077177 MULTI-PERIOD, MULTIPLE CRITERIA OPTIMIZATION SYSTEM FOR MANPOWER PLANNING.** This paper discusses a multi-period, multiple criteria optimization system for manpower supply forecasting. The system is used to identify recruitment and promotion strategies for managing the enlisted force of the U.S. Navy. With the criteria modeled as trajectories of goal values over the multiple time periods, the system uses the interactive augmented weighted Tchebycheff method as its solution procedure. Illustrative computer results are presented. (Author abstract) 25 refs.

**077178 TIME-SHARING REVISITED: TEST OF A COMPONENTIAL MODEL FOR THE ASSESSMENT OF INDIVIDUAL DIFFERENCES.** Five proposed components were assessed: (1) serial processing ability; (2) an internal model of the system dynamics; (3) performing heterogeneous operations; (4) adaptation to rapidly changing dynamic conditions; (5) parallel processing ability. The approach combined methodologies from experimental psychology and from individual differences research. The results of a factor analysis and a series of stepwise multiple-regression analyses revealed two important dimensions of individual differences in dual task performance: (1) individual differences in cognitive style linked to the concept of field dependence/independence;

(2) individual differences in time-sharing ability. (Edited author abstract) 27 refs.

**077179 ON THE EXPERIENCE AND GOALS OF THE WORK CARRIED OUT AMONG YOUNG SCIENTISTS AND SPECIALISTS.** The primary goal of all scientists and the Soviet youth is promotion of scientific research work and provision of a decisive shift to the solution of vital practical problems significant for the country. Unification of young scientists within the task-force committee for scientific principles of occupational hygiene and pathology facilitates successful solution of topical problems. Councils of young scientists and specialists make an essential contribution to enhancing research and political activity of young scientific workers. The necessity of improving the councils' activity aimed at professional training of the youth and accomplishing close links between theory and practice is set forth. (Author abstract) In Russian.

## Handicapped Persons

**077181 SUBSIDIZED TECHNOLOGY AND ITS UTILIZATION: AIDS FOR THE DISABLED.** Subsidized research into advance technology is one means employed to attain social and ideological goals recognized as vital to a society. Increasing sensitivity to the social uses of technology has recently led to funding of R&D in aids for the disabled. An analysis of 89 such projects between 1979 and 1983 confirm the impact of subsidized public funding on such research, leading to a narrow focus on applied research in specific disability areas with the objective of creating a viable commercial prototype for a highly visible but extremely small number of severely disabled. Subsidized funding also reinforces specialization through selective support of projects by institutional setting. The impact of subsidized R&D for the disabled can therefore be said to be effective as an example of societal intervention in directing technological advances. (Edited author abstract) 21 refs.

**077182 SIMPLE TECHNIQUE OF ASSESSING CREDIBILITY OF DIFFERENCES IN TEMPORARY DISABILITY RATES.** Recommended techniques of assessing differences in disability day rates by diseases can be used only while studying temporary disability in large population groups or under significant in large population groups or under significant rate differences. Determination of regular distribution rates of disability days by diseases offers a possibility of developing a simpler and more convenient formula for calculating a mean error and evaluating the significance of indices while analyzing temporary disease-associated disability rates in various working groups. **077183 BENEFITS AND COST SAVINGS FROM A SMOKING POLICY.** The first section of this article describes various smoking policies and discusses their implementation. The next section on the potential cost savings from a smoking policy covers such areas as health care, disability, premature withdrawal from the workforce, absenteeism, productivity, maintenance, property damage, depreciation, insurance, and involuntary smoking. The legal implications of not having a smoking policy are discussed. 14 refs.

**077184 CLEAN ROOM GARMENTS - A DAY IN THE LIFE.** An experiment is described in which garments worn in a Class 100 room were tested for particulate contamination at four intervals during one day. Clean room clothing made of lightweight, cold-calendered polyester (Terylene), of pore size 20-27 micron diameter<sup>4</sup>, was processed to a mean batch particle count of 840 particles (5 microns and larger) per square foot of fabric. On the basis of the least squares correlation, the slope of the line gives a value of 592 particles per square foot per hour as the mean rate at which the outer surface of clean room garments became contaminated with 5 micron particles during active work in a Class 100 room.

**077186 PRODUCTIVITY AND JOB SATISFACTION AFTER THE INTRODUCTION OF NEW TECHNOLOGY: SOME EMPIRICAL FINDINGS FROM THE SWEDISH TRANSPORT AND ENGINEERING SECTOR.** In the transport sector the results from the empirical studies show both a gain in productivity and an improvement of job satisfaction. In the engineering industry, however, the implementation of new

technology has been prolonged to such an extent, that it is too early to make any definite judgement about the development of productivity and job satisfaction. As a conclusion based on observations during the studies reported, some fundamental job demand conditions for a positive outcome are given. (Edited author abstract)

**077187 HUMAN RESOURCES MANAGEMENT: THE G.N.F.C. EXPERIENCE.** GNFC, a joint sector Company manufacturing fertilizers, is now in the fourth year of commercial production. The organization has had many 'firsts' to its credit during this brief period. Effective human resources management is a major factor in this achievement. An outline is presented of the strategies used in the recruitment and training of new personnel, their training in the process licensors' plant abroad and training by process simulation. Special features of human resources management during the project stage are presented.

Bhatt, M.M. (Gujarat Narmada Valley Fertilizers Co, Narmadanagar, India). *Chem Age India* v 37 n 8 Aug 1986 p 583-586.

**077188 MAKING GROUP COLLABORATION WORK.** Collaborative group building improves the way a work unit can accomplish tasks, solve problems, and deal with related matters. In general, group members (subordinates and group leader) should always encourage and support an open dialog of ideas and thought. When an individual can demonstrate the superiority and validity of his or her ideas, the others should be sufficiently flexible to throw their support in the direction of the best decision. Members of the work unit should always be willing to consult with others in the group who have the required knowledge so that the best collaborative solution may be reached. 5 refs.

**077189 EARLY RETIREMENT OR FORCED RESIGNATION: POLICY ISSUES FOR DOWNSIZING HUMAN RESOURCES.** The impact of downsizing goes well beyond mere economic considerations. Trimming the labor force more particularly—the specific method chosen to cut staff—will affect not only the firm's economic status, but also the overall competency of the human resource group, the success of current and future business strategies, and the organization's culture and image.

Kuzmits, Frank E. (Univ of Louisville, KY, USA); Sussman, Lyle. *SAM Adv Manage J* v 53 n 1 Winter 1988 p 28-32.

**077190 SOME PRINCIPLES CONCERNING RELIGIOUS DISCRIMINATION IN THE WORK-PLACE.** This article discusses some of the principles concerning religious discrimination that have emerged from the courts, largely within the last decade. After explaining how Congress has defined 'religion' and what principles are used to determine religious discrimination, the author summarizes how these principles have been interpreted in various courts. Lastly, he offers human resource managers some recommendations on avoiding religious discrimination in the workplace.

**077191 MANPOWER PLANNING IN THE UNITED KINGDOM: AN HISTORICAL REVIEW.** This paper traces the growth of manpower planning in the United Kingdom from its origins in the Second World War to the present day. It identifies a series of stages, starting with the beginnings and growing awareness of the 1950s and early 1960s, which led on to an explosive

growth between 1965 and 1970, and the lengthy period of consolidation thereafter. It places on record the interest and contribution of many individuals and organizations who laid the foundations of manpower planning in this country, and review trends in methodology and the growing role of computers. The paper concludes with some notes on possible future developments. (Edited author abstract) 51 refs.

**077192 ARMY MANPOWER LONG-RANGE PLANNING SYSTEM.** The Army Manpower Long-Range Planning System (MLRPS) provides the analytical capability to project the strength of the active U.S. Army for 20 years, thus allowing for the development of long-range manpower plans. The system's models simulate the interaction of gains, losses, promotions and reclassifications to enable the analyst to determine the impact of existing policies over the long term, and to determine changes that might be required to reach a desired force. The MLRPS currently supports the personnel planning requirements of the Army Office of the Deputy Chief of Staff for Personnel in long-range planning, policy planning and force structure analysis, and cost analysis. This article describes the system's main elements and component subsystems. (Author abstract) 9 refs.

## Mathematical Models

**077193 DYNAMICS MODEL OF THE AGE AND QUALIFICATION STRUCTURE OF A PERSONNEL SYSTEM.** Methods of the queueing theory can be used in modeling the movement of personnel, in problems of demography, etc. An organizational system based on rank was considered and moment functions were obtained for the number of personnel of various qualifications given by their ranks. In this paper we consider a more general problem concerned with the study of dynamics of an organizational system of the rank type, with the age (or the length of service) of the personnel taken into account. 1 ref.

**Monitoring** See IRON AND STEEL PLANTS—Health Hazards.

**Motivation** See Also INDUSTRIAL HYGIENE—Personnel Training.

**077194 MANAGING CHANGE WITH PEOPLE.** Changes connected with factory automation and their effects on personnel are discussed. The success or failure, adoption or rejection of a transition, transformation or change process - regardless of form - depends on the people involved. Employees are considered as intelligent professionals who do make a contribute to overall success of the manufacturing process. Without the personal involvement of the individual, any probability for real success is impossible and the best technical or hardware-oriented plan will fail. While the new processes are planned and adopted in stages or cells, care must be taken to make sure that ultimately all of the pieces can be integrated.

**077195 MAKING SURE PROTECTIVE CLOTHING PROTECTS.** The recommendations in this article reflect the subcommittee's current direction, unless otherwise attributed to ASTM or some other source. Developing realistic standards of either the documentation or performance type entails making choices about what characteristics to test, how to test, and how extensively to test. These considerations are apparent in the chemical protective suit standards ASTM and the National Fire Protection Association (NFPA) are coming up with, which fall into four general areas: chemical resistance, physical properties, component functioning, and overall suit quality.

Stull, Jeffrey O. (NFPA). *Fire Eng* v 140 n 9 Sep 1987 10p between p 22 and 37.

**077196 HOTTER THAN HOT.** Generations of fire-fighters have tested themselves against smoke and heat, protected, for many years, by the simple barrier of a leather helmet and a canvas or rubber turnout coat. These were reliable allies against the punishing conditions of the vast majority of fires, good for temperatures reaching as high as 500°F in structural fires. Even with wraparound insulation, no one would associate the word comfort with high-temperature protective suits. Even though a shiny outer layer on some of the suits reflects a lot of heat, the heat that gets through stays inside. One thing remains the same as in the more familiar structural fire - size-up is important. Part of the size-up the identification of the sources of heat.

Grenader, Robert (Halprin Supply Co, Los Angeles, CA, USA). *Fire Eng* v 140 n 9 Sep 1987 p 39-41.

**077197 EFFECT OF MOISTURE ON THE BURN POTENTIAL IN FIRE FIGHTERS' GLOVES.** The effect of moisture on thermal protection in fire fighters' glove materials was determined during radiant and conductive heat/pressure exposure. Typical glove materials were studied with and without a Gore-Tex moisture barrier. During exposures to a radiant load of 2.3 cal/cm<sup>2</sup> sec, wetted samples provided more thermal protection than dry samples. Different results were obtained using conductive heat/pressure tests (500°C at 0.25 kg/cm<sup>2</sup> pressure): dry Gore-Tex mitts provided more thermal protection than totally wetted samples, while the reverse was true of glove materials without Gore-Tex. (Author abstract) 11 refs.

Veghte, James H. (Biotherm Inc, Beavercreek, OH, USA). *Fire Technol* v 23 n 4 Nov 1987 p 313-322.

**077198 SIMPLIFYING SELECTION OF PROTECTIVE CLOTHING.** Changes that may improve the process of selecting protective equipment are now taking place. Among recent developments in the United States are (a) the consideration of industry-wide standards for testing total-ensemble suits and documenting the results; (b) the introduction of new suit materials with unsurpassed ability to resist chemical permeation; and (c) a growing awareness of the importance of integrated equipment. Together, these developments are leading to changes that should eliminate much of the guesswork in the suit selection process.

Kairys, Christopher F. (MSA, Pittsburg, PA, USA). *Fire Int* v 11 n 107 Oct-Nov 1987 p 111-113, 116-117.

**077199 PROTECTIVE SUITS FOR CHEMICAL SPILL RESPONSE.** In their role of responding to potential or actual hazardous chemical discharges, U.S.

Coast Guard response personnel and marine inspectors need adequate protection equipment and procedures to ensure their safety. The hazards associated with chemicals require a wide range of personnel protection gear from gloves and overalls to totally-encapsulating suits with self-contained breathing systems. A Chemical Response Suit developed by the Coast Guard has been successful in meeting field protection needs. The development has been extensively supported by materials testing and evaluations of overall garment performance. Promotion of suit selection guidelines provides a consolidated information source for hazardous chemical response teams in selecting and procuring protective clothing. The development of comprehensive standards will permit all response organizations to have greater confidence in the materials and clothing they do procure. 10 refs.
